Q. (By Mr. A. L. HARRIS.) Have you anything further to say in regard to organization of agriculturists?—A. That is a hobby of mine. I think the farmers, recognizing the fact that everything around them was organizing and combining, and attempting in one way and another to control production and prices and regulate their interests in other ways by combining all their influence and power, became satisfied that they must for their own protection organize their forces and make available their power, and that led to the formation of these farmers' organizations. It was a matter that seemed to be forced upon them. Of course, the decline of prices after the war, and other causes, made the farmer a little dissatisfied. They had been getting large prices. Perhaps they were somewhat fictitious, but they recognized the fact that the prices were declining, and they believed their interests required the formation of organizations. They believed the railroads were discriminating and extorting unreasonable prices in many instances. They knew they were discriminating, and they thought the charges were unreasonable sometimes. They organized practically with a view, first, of protecting their financial interests; but they soon thought it necessary for them to go beyond that and look after their social interests and cultivate their intellectual powers, and all that became a part of their work as an organization. They wanted to be in a position so that if legislation was needed to protect an agricultural interest, they could bring their power to bear to get it. If a combination of many manufacturers and business men or merchants was formed to oppress them, to force down the price of what they had to sell, or force up the price of what they had to buy, they wanted to be in a position to meet them. For instance, if the pork packers got together and said, "We won't pay any more than 3 cents for pork," they thought it would be advisable to get together and say, "You can not have our pork for less than 4 cents." Or if the National Cordage Company or some other combination of manufacturers of binder twine got together and advanced prices unreasonably, farmers could protect themselves by refusing to buy at that price.

There was a time when the manufacturers of agricultural implements would not sell anything to the farmers directly. They had to pay two prices for everything they got, because of the expense of selling; farmers did not know anything about the first cost of goods. They organized for the purpose of finding out these things and protecting themselves. They have done a great deal in the way of ascertaining the first cost and securing supplies at first price. They have some-

times protected themselves from unjust combinations to put down prices. Perhaps I can illustrate that in the matter of wool. I was interested in that because I was a woolgrower. Circulars went out all over the country to local buyers, saying: "You paid too much for wool last year; must not pay so much this year; better commence preparing the woolgrower to take 25 cents for his wool." I watched it, and every place I went buyers were talking 25 cents for wool this year. I was master of the State Grange, and put out a circular advising woolgrowers to commence the work of preparing buyers to give 80 cents for wool. I do not know what influence it had, but I know they did not get the wool for 25 cents.

A few years ago Mr. Arbuckle would not allow his coffee to be sold for less than 25 cents a pound. If a man sold it for less he was put on the blacklist, and they would not let him handle it. My attention was called to it, and I at once put out a circular. I had the blacklist containing the name of every man that had sold below the stipulated price, and to whom wholesale dealers were not allowed to sell. I put out the circular giving the facts in the case, and suggested that it might be a good thing to stop buying Arbuckle coffee and buy some other kind or drink something else. Within 10 days the man who gave me the information got notice from the firm that he could have the coffee; that he could buy it wherever he pleased, and sell it as he pleased. I do not know that the circular that went out had anything to do with it; but when a man in a business of that kind understands that there is an organization of farmers that is not going to consume that particular article under the terms on which it is sold it would probably have the effect of waking him up.

Q. (By Mr. FARQUHAR.) Is your organization as active now in these matters as formerly?—A. Yes. They are more active. They are doing more work, but in a different way. We have learned that there are different ways of doing things. Bluff and blow and bluster do not accomplish much. We are very thoroughly discussing the propositions that we undertake to carry through. If we want any reformatory legislation we discuss it thoroughly until we are pretty well satisfied what is right. We think it would be very bad policy for us to ask for anything that is not right and fair to other people. That would be a great mistake. And, whilst we are insistent upon having what belongs to us, we are willing to concede to the other fellow all that belongs to him, and so we are pretty careful. Our organization made a great raid on the middlemen. There was good reason for that. We paid, as I have stated, two prices for farm implements. You could not buy them if your farm was opposite the factory. Could not buy them at all. You would have to go to the agent and pay him 50 per cent more than he paid for them. Those people were taxing us too much. We learned that there was work for us to do. We wanted men to look after those things.

Q. Does the middleman exist now in sales of farm machinery?—A. Oh, yes; they have their agents everywhere.

Q. Is it now done more by salaried men, instead of under the old commission system?—A. A good many of them are salaried, but there is some commission business done. We have arrangements through which we can buy our supplies without buying them that way, if we want them. They have to sell them at a pretty fair price, or we do not buy them.

Q. (By Mr. KENNEDY.) Do you look forward hopefully to the time when there will be such a thorough and perfect organization of the farmers that they will be able to withhold their products if the price offered them is below the cost of production or below a figure that would return them a profit?—A. I do not think there can ever be an organization that will include all the farmers and lead to a perfect unity of action along that line, but I do think the farmers can be organized and educated to a point where they will withhold from the market a staple product when it is below the cost of production. For instance, when wheat ought to bring 75 cents a bushel to return first cost, if it drops to 60 cents, if the farmers should have no wheat to sell at that price, it would soon go to 75 cents. If they would take half the wheat off the market and sell the other half, if they would throw away half, or feed it to the hogs or chickens, they would get more for what they would sell than they would get for the entire crop. When the thing goes to an extreme in that direction, I think the farmers could protect themselves; but I do not think they could ever form an organization that would enable them to fix arbitrary prices on their products, nor do I think it would be a good thing if they could.

Q. (By Mr. A. L. HARRIS.) Do you think the combinations in other industries are forcing the farmer to do that?—A. He may do more and more of that, but I do not think, scattered as they are over a vast territory, that you can ever get them all together. Last year when wheat dropped down they thought wheat

ought to sell for a better price than it was bringing, and wheat was withheld from the market. I can illustrate by a little incident in my own experience. I lived on a farm, as I told you, before I came to Washington. We had our own butter—kept a few Jerseys—and had a little to sell. I used to take it up town myself and sell it, and they paid me 10 cents a pound for it at the time I speak of. Of course, I lost at least 5 cents a pound, so far as real profit was concerned, if not 10 cents. It helped pay the grocery bill, however, and I let the surplus go. There was not enough good butter brought into town to supply the local demand. I knew that. I went up one day with my basket on my arm and handed my grocer the butter. He weighed it out and put up the groceries I wanted. When he commenced to figure up I did not like the figures. I said: "What is the matter here? You ought to owe me, but I owe you." He said: "Butter is only 8 cents a pound." "Only 8 cents a pound?" "Yes; none of us pay more than that." I did not look very good-natured about it. He said: "You are mad now." I replied: "I am as mad as the devil. It is an outrage. You can sell every pound of good butter that comes into this market. There is a local demand for it. These consumers are willing to pay a fair living price. Ten cents a pound is a low price. You have all agreed to pay only 8. Now, sir, I have no more 8-cent butter to sell." I went up to the grange immediately and said to them that we had better not sell any more 8-cent butter. Three or four days afterwards I went to the grocer and he said to me, "Why don't you bring me some more butter?" I told him my cows did not make any 8-cent butter. He told me to bring it up and he would give me 11 cents.

Q. (By Mr. RATCHFORD.) Does the organization of which you have been speaking ever enter into strikes?—A. No.

Q. Do you regard the action of the farmers in combining and holding their pork, wool, butter, and produce, as a species of strike?—A. In one sense it might be. A man strikes, if he strikes because the wages are not satisfactory; if he is not fairly paid he quits work.

Q. Is not that what the farmer is striking for, when he withholds his product?—A. Yes; but if anyone else comes in and sells butter for 8 cents, he lets him sell it. He does not interfere.

Q. (By Mr. KENNEDY.) Might you possibly boycott the man with whom he deals?—A. Yes.

Q. (By Mr. RATCHFORD.) Is refusing to patronize merchants who hold their supplies at an unreasonable price understood as a boycott in the organization which you represent?—A. No; not exactly. Of course, if the dealer charges more than a fair price and we know it, and if we can buy of anybody else cheaper, we do so. If he puts it up too high we get along without it. For instance, when the combination put up binder twine from 10 to 25 cents we concluded we would get along without twine.

Q. (By Mr. FARQUHAR.) What was your substitute?—A. We did not have to substitute; twine came down.

Q. (By Mr. RATCHFORD.) Is your association purely for defensive purposes?—A. We have that feature. We will undertake to protect ourselves from combinations that attempt to force prices below what would be fair or charge more than is fair. If we can do that we will do it, but of course it will simply be a matter of peaceable arrangement with us. We understand that if anybody else comes in we can not help ourselves. That has been one trouble; farmers would accept conditions we would not favor.

Q. (By Mr. KENNEDY.) Have you any fear of the injunction against this boycotting and striking?—A. No.

Q. (By Mr. FARQUHAR.) Is your organization increasing in numbers?—A. Oh, yes.

Q. When was it first organized?—A. It became strong about 1873. It was founded in 1866. The National Grange was organized in Washington with 7 members. It had not much growth until 1872 or 1873.

Q. What is your membership now?—A. I do not know the figures exactly. We have in the country something like 28,000 organizations.

Q. How many States do you cover with your organization?—A. We have local organizations in every State except some of the new States. The organization in some of the States is very weak; in others it is strong. We have gained in membership in the last 10 years probably 100,000.

Q. Have you any political feature in your organization?—A. Oh, yes. We expect to do a good deal politically, but not in a partisan sense. We have representatives from all political parties. All we aim to do as an organization is to reach a man and insist upon his making good use of his political power as a citizen in the proper way. We do not allow our organization to dabble in partisan matters at all; can not do it without violating our rules; but we hope to

secure some political reforms. For instance, we want Senators elected by the direct vote of the people. We think the experience of the last few months has demonstrated that that would be a good thing.

Q. (By Mr. A. L. HARRIS.) Have the results so far been encouraging?—A. Very. The farmers are taking very much more interest in public questions; they understand them better, and are more patriotic than they were years ago on account of this agitation.

Q. What have you to say of the present production of the farm in relation to consumption?—A. I think we are producing in some lines more than is profitable. I think in some lines it would be better to diversify. For instance, we import \$200,000,000 or \$300,000,000 worth of agricultural products every year. Of course, some of it we can not grow here. Some of it we can and ought to grow here. I think it would be better for us to produce some of those things we buy and curtail the production of some things which, because of large production, are selling too low.

Q. (By Mr. KENNEDY.) Do those imports include tropical fruits?—A. Yes, some of the things we can not produce; but sugar is not one of them.

Q. (By Mr. FARQUHAR.) Is Canadian grain included in those products?—A. No, they do not hurt us now; they do not sell us much grain. We sell them grain; oats and barley might come in. The Northwestern States, I think, are growing more barley than they used to.

Q. (By Mr. A. L. HARRIS.) What is the effect of this overproduction upon existing prices?—A. It lowers the price whenever you produce more than the market will readily absorb. For instance, the price of wheat is fixed by the price of wheat in Liverpool. There are incidental things that affect prices; perhaps the gambling in Chicago, or lowering or increasing railroad rates. But the price of wheat is largely regulated by the price at Liverpool, and what it costs to get it there. They want in Liverpool, in addition to what they have in their own country, say, 150,000,000 bushels. If we offer them 100,000,000 bushels we will get a good price for it. If that is all the markets have for sale, that price will fix the price of every bushel in our country. If we offer them 300,000,000 bushels when they want only 150,000,000, they will fix the price and fix it very low. They will put their hands in their pockets and whistle until we get ready to take a low price. They are in no hurry; they can wait; they know we have to sell. That would not matter so much to us if that low price they paid us did not fix the price of every bushel of grain we sell in the United States.

Q. (By Mr. FARQUHAR.) The cereals in this country being 90 per cent of national consumption of the whole product, does the 10 per cent sold in the foreign market regulate the price locally?—A. Yes; that is a fact. Of course, as I stated, there is occasionally an incident that will interfere with it. That is where we are very much interested in this matter. Our farmers ought not to sell one bushel of wheat in Liverpool. We ought to let them have the flour; it ought to be worked up ready to be made into bread. We should keep the bran and shorts at home for the stock, and all fertilizing material should be kept at home.

Q. Would your withholding the American product ultimately develop Argentine, Danubian, and other sources of supply?—A. It might. I want to supply them flour. We do not propose to starve them. We should get all the labor out of it and that fertilizing material before it goes over there, and let them have the flour instead of shipping them the wheat. It would maintain the fertility of our soil, and still they would have their bread. They must have this wheat; that is what frightens them when they find there is a shortage of supply. If they begin to fear that somebody is going to have short rations before the year is over they are anxious to buy; but the farmer who knows that is not anxious to sell. He waits; he says he will take that profit, whatever it is, and, by and by, if his idea is correct, wheat goes up, and the farmer gets the profit instead of the speculator. That is what has helped the farmer out in the last 2 or 3 years; they have gotten millions that ordinarily they would not have gotten.

Q. Are you taking the profits of the wheat pit a good deal and dividing it among yourselves?—A. We simply waited. The indications were that wheat would advance and, instead of rushing it on the market and breaking it down or helping those gamblers to break it down, we waited and got the advance ourselves.

Q. (By Mr. A. L. HARRIS.) In what line would you suggest diversification of agricultural industries?—A. We should feed our grain to our stock, and raise the best kind of stock and put it in the best possible condition before we parted with it. That would consume a large part of our surplus. We would get the profit. When we find we can not grow a certain crop with profit we should perhaps not abandon it entirely, but work gradually into other productions. There is always something the farmer can grow that the world wants and will pay good prices

for. If he offers the world more than it wants of other things it buys them at its own price.

Q. Your department has made a survey of this country and has charts showing the best territory for securing specific products; for instance, sugar beets. Will you state to the commission what the outlook is?—A. There is no question that we can produce in this country all the sugar we want and perhaps have sugar to sell. It will be a good business in certain localities, and it has been pretty fairly demonstrated that the sugar out of it will be clear profit. Build factories and establish around them dairies for the production of butter, cheese, etc., and feed the cows on the pulp of the beet. That business will pay for the growing of the beet; the sugar will be profit. Whether that will be so or not I do not know. If sugar will remain at about 5 or 4½ cents a pound we will in a few years produce all the sugar we want in this country and make a fair profit on it. If these new possessions of ours should give us sugar for 2 cents or 2½ we might not think it profitable to grow beets for sugar. Horses are growing on the ranges and are not worth \$10 a head. Nobody wants them; they can grow horses that are worth \$100 a head. There is a demand in Europe for army horses, for instance. If they grow the kind of horses the market wants and is hunting for, they can make a profit on them. Our idea is to induce the farmers to grow a kind of horse the world wants.

Q. (By Mr. FARQUHAR.) That is to improve the breeds or grades?—A. Yes.

Q. Sowing the best, reaping the best?—A. Yes.

Q. (By Mr. KENNEDY.) Is your organization very strong in the South?—A. No; we are rather weak in the South.

Q. Have you been able to do much toward encouraging the farmers of the South to diversify their crops?—A. Our Department of Agriculture has been working on that line; has been trying to do a great deal. We have some organizations down there; they have our literature; they know what our views are. It is a very hard matter, and it takes some time to get them to change, especially where for a long series of years they have been doing a certain kind of work. It takes longer to change a custom in the South than in other portions of the country where they have not been accustomed for so long a time to one kind of farming. There are a great many reasons why the order is not as strong in the South as in other sections.

Q. (By Mr. A. L. HARRIS.) What would be the effect of the extension of foreign markets to agricultural products?—A. I think it would help us a little if we could hunt up new markets. I think if we could sell our butter and cheese in new markets it would help us, and I will tell you how you can help us yourselves. If you can get the Congress of the United States to make it a crime involving a heavy penalty to sell something for what it is not, putting frauds on the market, and offer to the foreign consumer only genuine cheese and good butter, you can extend our market for those things. As long as they are offered filled cheese and something that is a substitute for butter they are suspicious of all our products of that kind.

Q. (By Mr. FARQUHAR.) Is the Canadian cheese preferred to ours in the foreign market?—A. Yes; because they do not make filled cheese or skimmed-milk cheese.

Q. (By Mr. A. L. HARRIS.) To what extent could our consuls help us?—A. If they were enthusiastic, and knew anything about the business, they could help us. There ought to be in all the foreign countries we trade with men whose special work it is to look after markets for American products.

Q. (By Mr. FARQUHAR.) Do you think, in consideration of the immense exports we have had, that it is remarkable that very little attention is given in the consular service to the farming interests?—A. If they sent a few more farmers over there they would take more interest. A man takes interest in something he knows about. We want a representative that actually represents, a man can not represent anything he don't know anything about. We have one or two attachés connected with some important consular offices over there, and they are looking after the matter. I write them every once in a while asking for information. I have a friend in Germany who writes me regularly, giving me information about agricultural conditions around his point of observation.

Q. (By Mr. A. L. HARRIS.) What would be the effect of a good American merchant marine?—A. I am inclined to think it would be a good thing. Anything that would tend to open up new markets for our finished products would be a good thing for our country. There are countries that do not know anything about what we have to sell that would be willing to pay good prices. There are countries that pay 70 cents a pound for butter, and are glad to get it; that do not know anything about our butter.

Q. How do we reach those countries at present?—A. Our stuff has to go through merchants of other countries now, I suppose.

Q. In shipping from New York how could we lay our products down in a country, say in South America, that we are not in close connection with, by merchant ships making regular runs?—A. It would have to go to Liverpool, and then be reshipped, and if it was better than the English product, it would be sold as an English product, though it was produced in this country.

Q. Would the American producer have to stand the extra freight?—A. Yes. I think there is some good probably coming along that line, but it is a line we are not so familiar with.

Q. To what extent would the agriculturists in this country be benefited by the Nicaragua or other canal in getting farm products of the Mississippi Valley, say, to the Pacific Ocean?—A. I think the farmers on the western shore of the continent would be benefited, and the farmers toward the Gulf of Mexico would perhaps be benefited. Of course the farm pays every cent of the transportation charge. The man that handles it never takes any chances of collecting the transportation from the consumer. He takes it out of the first hands. For instance, in hauling grain to Liverpool from any point in the West, if the rate goes up 5 cents wheat goes down 5 cents in the Western market.

Q. (By Mr. FARQUHAR.) Does such expense lessen the price that goes to the original producer?—A. Yes. When the merchant buys it he figures out all commissions, freight charges, and everything of that kind he must pay, and the balance, after taking out his own profit, goes to the producer.

Q. The cheapening on the producer does not help the consumer?—A. No. The gap is pretty wide between what the consumer pays and what the producer receives. The difference between what I pay for butter here and what I get for butter on the farm is pretty wide.

Q. (By Mr. A. L. HARRIS.) Have transportation rates increased or decreased on agricultural products in the last 30 years?—A. Decreased largely. There is this about it, however: It is claimed, and I was told of it by a man connected with the railway interests for many years and who used to be in Congress, that when there is an enormous crop to go east over the railroads and everything is going to be crowded, they put the price of freight up. They reap the profits by putting up the prices of freight. Five cents a hundred makes a mighty difference to the railroads, and that much difference to the farmers; it puts down their price. Many times a good crop is parted with by the farmer without much profit because of that fact; it costs him more to get it to market.

Q. What effect have low rates had on the farmer in the Middle States?—A. It has deprived him of the advantage of location. For instance, they can charge the farmer who lives at Rochester, N. Y., just as much for putting his product into New York City as they charge the farmer who lives in Colorado, San Francisco, or Kansas. They can not charge more, but can charge just as much, under the interstate commerce law. The through rates are very much lower, of course, than the local rates, and it deprives the man of that advantage of location.

Q. Has that condition helped to develop the new West?—A. Yes; but it is death to the fellows that live between.

Q. Are all farmers clamoring for low rates?—A. Yes.

Q. Do you wish to say anything on the subject of country roads?—A. No; not much. Of course it would be a great advantage if we had good roads. The farmers complain of taxes, and they are, as I said, taxed pretty heavily. I do not think the farmers would complain of the cost of good roads if the cost could be fairly distributed among the taxpayers. They do complain about paying for building roads for the fellow with the bicycle to ride over. The farmer has to pay it anyway; if he does not pay it for building roads, he pays it in his team going through the mud.

Q. (By Mr. BATHFORD.) What escape has the farmer from the payment of excessive rates?—A. It is a pretty hard matter for him to control unless he can get legislation that will fix the maximum rate.

Q. At present has he no escape; is he obliged to ship his grains usually over one road?—A. Whether he does or not, it is the same thing; there is no competition.

Q. Is he obliged to sell to the railroad companies?—A. I think that is sometimes so in the extreme West, where they own the elevators.

Q. Is the Western farmer obliged to sell his produce at the prices offered him, and pay the transportation rates that are demanded for the shipment of it?—A. When they offer him a price they take out the transportation prices, of course; if it is high they take out more than they would if it were low. The farmer west of Chicago, for instance, pays a high rate to get his grain into Chicago, but the man that ships it from Chicago east gets a pretty low rate. They make special contracts and can get it through low. All of the charges come out of the farmer. The many millions that are paid to the people who insure the grain that never grew comes out of him.

Q. Do those who fix rates do it with a thorough knowledge that he has no escape from them?—A. Of course, if he sends it over their road he must pay the price.

Q. Can he send it over any other road usually?—A. The only thing he can do is to reduce the bulk by feeding his grain into stock and shipping the stock, and that costs him less. He can save himself something in that way.

Q. (By Mr. A. L. HARRIS.) What do you know about the combination of railroads and elevator men, especially in the Northwest, in fixing prices, coming under the head of "Combinations to control prices?"—A. Of late years I have not given that matter very much study. I understand that there are combinations. The warehousemen in Chicago have a good deal to do with the expense of getting grain through Chicago. You know you can hardly get grain through to the sea unless it goes through Chicago. Those warehouse charges must be paid. They have the thing fixed so there is hardly any escape under the present system. The whole matter is organized so as to get a good thing out of it as it goes through.

Q. What do you know about the elevators along the lines of some of the railroads of the Northwest paying the same price, while you can not get a higher price from one than from another?—A. I have understood that was the case.

Q. Please state as fully as possible the effect of so-called grain and cotton gambling on prices of farm products.—A. The farmer has the impression that he is injured in the long run by this gambling in certain of his products. When he has a good crop, for instance, they can get the price down, and hold lower than it ought to be. They seem to be able to crush the man who undertakes to come in and put it up. Some people say there can not be a seller without a buyer. That is not so. These men can sell to their own men if they want to. Suppose a man wants to break down the market. He sells a large amount of wheat—wind wheat, as it is called. It does not exist. His own men buy it. It has its effects on the market—breaks it down. They are fixing prices on May and July wheat now, these boards of trade, and it is sometimes pretty hard to get the wheat above the prices they fix. Of course, if it develops that the crop is short; that these men have been mistaken in their calculations, the price gets away from them and goes up, and they lose some money. You take Mr. Leiter, for instance; you know of his recent experience. He can tell you what I can only guess at. I understand he wanted to buy wheat, and he simply meant to make the men who sold him grain deliver the grain. If he had stuck to that he would have been all right. I was reading an article written by a man connected with the business for a long time, and he said no man, no matter how wealthy and strong he was, could stand the strain a long time; that they would finally break him if he undertook to hold the price up. I think, in actual operations, they can hold the price down below what it ought to be easier than the other influences can hold it up to even what it ought to be. We do not want to stop actual speculation in grain—that is, we want the capitalists to buy the grain, all we have to sell, and carry it for us, and realize a reasonable profit; but it seems that the speculative feeling can be satisfied just as well with wind wheat. A fellow goes in and wants to buy wheat. Some fellow who has no wheat sells it to him; takes his chances; gambles; he is satisfied, and goes off the market. The number of buyers that way is reduced down by selling what does not exist at all. I can not see where we are benefited. I think we lose by this gambling. What I mean is by this buying and selling of stuff that men do not own or control, and never expect to own or control. I do not think we would suffer at all by the buying of wheat in advance of its time for delivery; but the more I think about it the more I am satisfied that we, in the long run, suffer by what is called "gambling" in these products. I know they make a great many rules and regulations that are injurious to us. As I hinted a moment ago, the men that deal and do business there have to pay taxes and insurance and warehouse charges on all this grain that was never raised. They have to pay for storing it the same as if it were there. They have to pay that storage charge to warehousemen. It amounts to millions of dollars annually. I do not think I am mistaken about that, because the president of the board complained of that in a letter he wrote. They had some trouble over it. On all this grain that never was handled—never came there—never could have been burned up because it did not exist, all those charges had to be carried. I think sooner or later this reaches back to the producer. He has it to pay. I can not see any advantage from it. Take oats, for instance; they do not gamble in oats as they do in wheat. Oats are commanding a fair price.

Q. How about corn?—A. They do not gamble in corn as they do in wheat; not so much.

Q. And barley?—A. Do not gamble in barley.

Q. Please define what you term gambling.—A. What I term gambling is this: Here are men on the board of trade; that is their business. They pay a large amount for the privilege of being on the floor to do business. Suppose you were

one and I the other. You sell wheat and I buy; that is, you offer to sell me 1,000,000 bushels of wheat. I agree to buy it. I must put up, when I buy that, a certain amount of money as a margin to cover the fluctuations; if that wheat goes down I must put up more money or abandon it; if it goes up the man who sold it must make it good; that is, he must make up the loss. That is what I call gambling. If you expect to give me the actual grain and do so, that is not gambling.

Q. (By Mr. CONGER.) Do they settle on the market price without regard to the wheat?—A. Yes.

Q. (By Mr. FARQUHAR.) If it is called, do you settle on the market price?—A. Yes; except that the charges have to be paid. We have to pay the charges for doing this business. He is interested in doing everything he can, of course, to put down the price. I am interested in keeping it up. It is a sort of see-saw among them. I can not see any good that comes out of that. I think the rules and regulations they make to carry on business in that way are very detrimental to the actual trade in this country, yet it is pretty hard to frame a law that will prevent this gambling and yet allow the business to go on in a legitimate way.

Q. Is it not done in all the markets of the world?—A. I do not think it is.

Q. In Liverpool?—A. I think it is.

Q. In London?—A. I do not know about that. Probably so.

Q. Does not a great deal depend upon the judgment of buyers as to seasonal changes and short crops?—A. Yes; anything that affects the actual production has its effect on the market.

Q. Is the grain dealer in the same position as the merchant who is taking a horoscope of the markets, studying the supply and demand?—A. If he actually bought the stuff and sold it, as a merchant does, it would be all right. We do not object to that.

Q. Would you say that the gambling exists in the nonholding of the product?—A. The injury comes in, I think, from the selling. Suppose we have 100,000,000 bushels to sell, and we have 500,000,000 bushels, and the word goes abroad that so much is sold. I suppose this knowledge can be used to affect the markets abroad. I do not know just what its effect is; it is hard to tell.

Q. Are you aware that in the Western States they have passed laws to suppress that sort of gambling in the wheat pits?—A. Yes.

Q. In Illinois?—A. Yes.

Q. And that the rules and regulations of the local boards are stronger than the legislature itself?—A. Yes.

Q. Is there no remedy?—A. As long as the people will submit to the violation of law by these people, of course there will not be much remedy.

Q. (By Mr. A. L. HARRIS.) Is it not possible to have it defined as gambling, and make it a crime?—A. Yes. The difficulty comes in framing the law so that it will not interfere with legitimate business and yet stop the gambling. Those fellows who had that fight understand that. Our organization made a great fight at that time. We were here backing it up; making a great fight with the others. They said if this law passes wheat will go down at once 10 cents a bushel in so many days. They made strong statements. It did not become a law, but wheat went down and kept going down. If the law had passed at that time and wheat had gone down, as it would have gone anyway, on account of the large surplus in the market and large crops, of course these people would have said, "See what you have done for yourselves; advocated a measure that has proved detrimental to you." So there is always a little danger in that kind of legislation, because there are agencies and influences that even the law can not regulate.

Q. Do you object to legitimate future sales?—A. Not at all; we want them to do that; it helps the farmer out. He does not have to build granaries to store the wheat himself. What we object to is the selling of stuff we do not have.

Q. Is it possible to frame a law defining "options" and "puts" and "calls"?—A. Yes; but you and I know that it is almost impossible to get a law through Congress or the legislature without having some amendments slipped in here and there that interfere, perhaps, with the free working of the law.

Q. Is it true that all reform legislation has to meet these difficulties?—A. Yes, it has to have a trial; we have to learn by experience.

Q. And you are not discouraged?—A. Oh, not at all.

Q. Where do you think such legislation should start—with the States, declaring dealing in options a crime, or with the National Government, under a tax authority, or the regulation of commerce between the States?—A. I think United States law would be the law. I do not think a State law would reach it, because the farmer out West suffers just as much as a farmer who lives in Illinois or Indiana.

Q. Can the United States declare a transaction of that kind within a State a

crime?—A. I do not know how far they can go in that matter. They might get it in under commerce between the States. This is a matter that affects all the States. It is not a State matter.

Q. (By Mr. FARQUHAR.) Has all the remedial legislation you have had come through taxation?—A. All legislation of that kind.

Q. Could you have an oleomargarine law without taxation?—A. No.

Q. Could you have an adulteration law or a law regulating filled cheese without taxation?—A. I presume that is the way of getting at it.

Q. Does it depend on the transportation at all?—A. Not at all.

Q. Has your organization ever seriously taken up this fight on grain gambling?—A. Oh, yes.

Q. Within a year or two?—A. Not since the Hatch bill. You can not do anything in this matter effectively until you have in Congress somebody who is willing to take up the fight and carry it on there in season and out of season, every day in the week, night and day. Be ready and fighting; that is the way Wilbur got the filled-cheese bill through.

Q. (By Mr. A. L. HARRIS.) I understand the report the committee made to the House on that bill laid more stress on the taxation clause of the Constitution than any other, and the regulating of commerce between the States came on rather from an argumentative point of view. Did it seem that the committee was not fully decided as to their power?—A. There was a great diversity of opinion; and some men with stronger interests were represented; sometimes it is really a difficult matter to tell how to do a thing and not do more harm than good.

Q. (By Mr. FARQUHAR.) Have you found that the legitimate grain men of the States have been favorable to your proposition?—A. Yes; many of their representatives were here advocating the measure. In explanation of the standing of the legitimate dealers, I understand that they objected to what they called "puts" and "calls" on the curbstone outside. They wanted that stopped, but they did not want the buying and selling of futures stopped as they did it on the board of trade under the regulations, and the fact is the same men who did it on the board of trade went outside and indulged in "puts" and "calls."

It might be well to say that their predictions did not prove true. They claimed that it would be beneficial; that we would be the gainers if the bill was defeated; the price would be better—it would go up and be maintained. That did not prove true. Prices went down and down right along; they never recovered for a long time afterwards. There may have been other causes. I do not say their dealings there had anything to do with that.

Q. (By Mr. A. L. HARRIS.) Have you any objections, if I want to sell my next year's crop, to my selling or engaging to sell it?—A. Not a bit, if you want to contract for it.

Q. What have you to say of legal regulation of trusts and corporations and combinations and other forms of monopoly?—A. Legislation thus far has not been very successful in dealing with these matters, but it seems to me there should be some regulation of these corporations; they ought to be kept within certain limits. A corporation has a certain power which the individual does not have; that is, they can combine elements of power, capital, intelligence, and all that; and when they are granted a charter to do business we think they ought to be required in the charter or by law to do a legitimate, straightforward business without interfering with other interests.

Q. Where should that legislation be enacted?—A. I do not know; perhaps that ought to be both State and national legislation.

Q. Does the corporation get its charter from the State?—A. Yes.

Q. How can the National Government control it unless it is an interstate corporation? Can it control it more than it can an individual?—A. I do not think it can, unless it becomes in some sense an interstate matter.

Q. Have you noticed recently a disposition to form what we call trusts?—A. Yes, there has been a marked development of trusts recently.

Q. What have you to suggest as a remedy for that tendency?—A. I do not know just how to deal with the question in detail, but think our legislatures and national Congress ought to be strong enough to protect the individual against the abuses of any combination or corporation.

Q. Is the present trend of trusts different from what it was a few years ago? Instead of combining corporations, are they now taking out new charters in certain States?—A. They may be doing that, changing from one State to another.

Q. Are all recent charters taken in the State of New Jersey owing to the fact that the New Jersey law rather invites them to come there?—A. I presume that is the case; they would not go there unless it is to their advantage. When our legislatures get at the matter in earnest and determine to remedy the evils, I think they will do it.

Q. What laws would you suggest throughout the States in this connection?—
A. The first thing is to get at the meat of the matter and study the effect of these trusts. Many of them make the claim that the public does not suffer; they combine for the purpose of reducing expenses, and do not intend to put up prices; but I am a little afraid when they get their full power, when they can control absolutely, they will be oppressive.

Q. What has been the result of the operation of the existing antitrust laws?—
A. I do not think these laws have been very effective. It is a very hard matter to get a law through the national Congress when the men who make the laws are interested in these trusts.

Q. You spoke about the interstate commerce law on long and short hauls. Has the interstate commerce law been effective?—A. I think it has done good. There is no doubt about that. They have investigated matters, and in a number of cases I know of have interfered to the benefit of the parties shipping.

Q. Would you advise an extension of that law?—A. I would give them more power. I would give them the power when they find a wrong to right it, if possible to do so.

Q. Can you suggest an amendment to the oleomargarine laws?—A. I would suggest an increase in the tax on oleomargarine sold in imitation of butter. If the general public know and are warned of the fact that it is oleomargarine when it is placed before them, and they want it, that is all right. No one has any right to object, but a large per cent of the people think they are eating butter.

Q. What is the operation of the existing pure-food laws in the States generally?—A. Where they are enforced by efficient officers they are doing good; they have not destroyed all the sale of impure food. It is still going on, but it has been some protection to the consumers and producers. A man whose duty it is to enforce the law is under strong temptations, and it is not always enforced as it ought to be.

Q. What have you to say on the advisability of Federal legislation on that subject?—A. I think there should be such legislation, because under the decision of the courts an unbroken package can come into the State, and no one can interfere with the sale of it. I think some interstate legislation, some national legislation, would be advisable. A great mass of the people, both producers and consumers, want to know what they eat.

Q. Would you advise in favor of a separate department to deal with this subject?—A. I do not know why it can not be made a part of one of the existing departments.

Q. Would it naturally be a part of the Department of Agriculture?—A. I think that would be a very good place to put it. The Treasury Department would be a good place, only the Treasury Department officials are so accustomed to seeing money come in they hate to see money offered them and not take it. If a man violates the law and offers a certain sum of money if they will not prosecute it is a great temptation to take the money and let him go.

Q. Is the operation of the Federal and State laws to prevent diseases among domestic animals satisfactory?—A. They are doing grand work. I presume they need some additional legislation; but I think the laws are quite effective in that regard.

Q. Would it be desirable if all the States had such laws upon their statute books?—A. Where they are having trouble I think it would be.

Q. Do you desire to say anything on the question of free rural mail delivery?—
A. We are all in favor of that. We think there should be an extension of the postal system. The country greatly needs the improvement. The men who live in the country are entitled to all the advantages of those who live elsewhere; and if it is possible to give them that service, it would be a greater advantage to them than to people in smaller towns. It would be a matter of great economy to the farmers. While it would cost the Post-Office Department something, it would be a great economy to the people. For instance, one man can serve 100 families in his circuit every day, which would save all of those families from going into town after mail. They would read more, I think, and it would increase the number of letters and the circulation of periodicals and papers, which would pay a large part of the expense. It would be a great saving of time and expense, when you consider one man could do what a great many men have to do.

Q. What do you think of the propriety of establishing postal savings banks?—
A. I do not know how that would operate. We are rather in favor of it, but to work it out in detail and have it operate successfully, no plan has yet been devised for this country. The only objection made to it is that it takes all the money out of the country and sends it away. Just what the Government would do with that money is a question.

Q. Do you think there would be a conjection of money in some places?—A. Yes; that is one objection.

Q. (By Mr. FARQUHAR.) How would the United States get any interest on that money?—A. Unless there could be some arrangement by which the man who deposits money can draw a little interest and the man who wants to borrow that money could pay for the use of it, it would not seem to be very helpful.

Q. Do you know any means by which the United States can get interest on such money?—A. That is a difficult matter.

Q. (By Mr. CONGER.) I have heard it suggested that the deposits in postal savings banks might be utilized by the Government in the erection of buildings for post offices, where the Government is now paying rent. Has that been discussed in your grange?—A. General Stone could use the money in building good roads.

Q. (By Mr. A. L. HARRIS.) If there is anything you desire to say in regard to anything we have not taken up, you are at privilege to enlighten us.—A. A vigorous effort was made to pass through Congress an appropriation for the purpose of impounding the head waters of the Missouri and great western rivers, building reservoirs and canals for the purpose of irrigating the arid land up there. It passed the Senate and was knocked out in the House in the conference committee. That is a matter I think of great interest to our farmers and to all people. What affects farmers affects everybody in one way or another. The time will come when that land will be needed. We farmers feel that it is not needed now for agricultural purposes, and we know that this scheme was just an entering wedge—it was just a few thousands now, which means hundreds of millions before they get through with it. When they commence agitating the matter of building reservoirs up there, the interested parties said they did not want the Government to build the dams; all they wanted the Government to do was to survey the country and locate these reservoirs. They wanted it to be a private enterprise, and they worked on that theory for some time; but now they have come to the point where they say, "If the Government does not expect to build these reservoirs, what did they go to the expense of making these surveys for?" I attended their convention last year, and for the first time they came out strongly on the ground that the Government was to build these reservoirs. The argument made, and the ground upon which they asked it, was that it would practically prevent the river from flooding the lower country in that way, and on that ground some supported it; I think our Senator did. That is a humbug, in my judgment. If the reservoirs were built, and dams constructed, they would hold the water until full and then the flooding would continue. The best engineer in the convention admitted that there was not anything in that; that it was talked for effect; that after the reservoirs were filled the water would go down just the same, and flood the country below. The claim was made that they wanted land for the landless, and homes for the poor. If that measure had been enacted and those dams were constructed—reservoirs, canals, etc.—we would find that all that land would be owned by syndicates, and the men who tilled it would get only a bare living. The men who controlled the land would be made rich, and the rest of us would "pay the fiddler." The time will come, perhaps, when this land will be needed; perhaps not in our time, and I think it is well for us to wait until that time comes. I am satisfied that ninety-nine thousand out of every hundred thousand of the farmers east of the Mississippi River are opposed to this. I do not know that this comes in the scope of your investigation; but it is one of the things that is advocated; one that ought to receive attention, and ought to wait until it is needed for cultivation. Then it ought to be controlled by the Government so that men who farm it will get the benefit and not some syndicate. Our organization is watching this. You will find on record in our association our protest against expenditures of that kind at the present time.

WASHINGTON, D. C., March 14, 1899.

TESTIMONY OF MR. AARON JONES,

Master of the National Grange of the Patrons of Husbandry.

The commission met at 10 a. m., March 14, 1899, Mr. Farquhar presiding. Mr. Aaron Jones, of South Bend, Ind., master of the National Grange of the Patrons of Husbandry, appeared and testified. Mr. Jones is also a member of the State Board of Agriculture of Indiana and master of the Indiana State Grange.

Q. (By Mr. FARQUHAR.) How many years have you been connected with the National Grange?—A. Twenty-six years.

Q. From its foundation?—A. No; the order is 32 years old.

Q. Please state the business of the grange, its membership, and the sections of the country it covers.—A. The fundamental purpose of the order of Patrons of Husbandry is the elevation and improvement of the agricultural classes from a social, intellectual, and moral standpoint, and to improve the condition of farmers financially. One of the great purposes of the founders of the order was to unite the farmers of all sections of the country in one fraternity. It was brought into existence soon after the war, to harmonize the different sections of our country and to prevent sectional strife. In this regard the order has had marked success. Its achievements in this respect are second to no organization that I know of. A better feeling has and does now obtain, through its influence, between the extremes of our country, North and South, East and West, than could possibly have obtained had there been no such order. It has shown that agriculturists must either stand together in all sections of the country or go down together. You can not make a law that will affect injuriously one portion of our country and its agricultural interests and not another portion; that we understand thoroughly.

Along our educational line, the order has improved the public-school system in country districts in every State of the Union, without any exception. It is making a strong effort now, with very reasonable probability of success, to introduce into our public-school system the study of agricultural science. We believe that the elevation or improvement and advancement, socially, intellectually, and financially, of the farmers of this country has to come through an intellectual standard. We are thoroughly convinced of that fact. No combination can be made so strong as the combination that comes through intellectual convictions of right. From a social standpoint the order has been of inestimable value to the agricultural classes. The very nature of the business of farming causes too much isolation. The farmers do not come into contact with each other and with other people enough. The order has a tendency to elevate them out of this condition, bringing a sociability into farm life that it has never known before. It creates a better feeling and better sentiment, harmonizes the people of the locality in which the grange is established, and factional difficulties between neighbors are removed. Lawsuits and difficulties in court are often obviated by the system of arbitration in the order and the friendly interchange of opinion. It is in that direction that the order has been of incalculable advantage.

I venture the assertion, and I believe it can be sustained, that to-day there would have been a much larger decrease of value of country real estate had it not been for the advance of intelligence and better society in the country brought about by the organization of the Patrons of Husbandry. We recognize two values to farms. There is the value of its income-producing qualities as a means of subsistence, and its value as a home—a place in which to live, to rear a family. If we can bring before the American people the great advantages of a home in the country and the desirability of rearing a family amid country surroundings, we will advance the price of real estate in the market, through the home value, at least 10 per cent above what it is to-day. In this regard I believe that the order of Patrons of Husbandry ought to have the encouragement of the National Government. It ought to have the encouragement of every good citizen of the Republic because it is building up a higher and better citizenship. As you stated, the majority of this board are men that came from country homes. Such is the case everywhere; the men that control and manage the Government in a large degree came from country homes. You elevate that condition and the chances are we will have still better men; a higher appreciation for honesty and purity of citizenship will be established in this Republic.

[A copy of the declaration of purposes of the Patrons of Husbandry was here introduced by Mr. Jones and placed on file.]

Q. (By Mr. FARQUHAR.) What have you to say as to the numbers in your order and its geographical divisions?—A. There are no geographical divisions. It has members in nearly all States, or in a large majority of them. We have organized between 27,000 and 28,000 granges in the United States. The individual membership of the grange never can run below 13. When it falls below 13 the charter is suspended and the grange does not exist. In some portions of our country the membership is as high as 600. The largest number in any one local or subordinate grange is 607.

Q. What are the various bodies composing your organization?—A. We have our subordinate grange—that is the basis of our organization upon which the whole superstructure rests, as does the Government upon the citizenship of the Republic. Then we have the county grange, where matters affecting the county interests are discussed. In the local grange they come together from distances

of from 10 to 20 miles. We have the State grange, which is composed of representatives of the subordinate and Pomona, or county, granges. They meet in annual conference and take into view all the agricultural interests in that particular State. We have the national grange, which is composed of the masters (and their wives) of State granges. They take into consideration the broad questions affecting all the States. We make prominent the improvement of our roads and homes. "I can take you into portions of our beautiful country, and after I have shown you the indications you can point out the homes of the patrons of husbandry by the additional beautification of their homes and surroundings and the magnificent shade trees they have planted for the comfort of their families and of their stock. Where the grange has been properly understood there is no friction nor objection on the part of business men, professional men, or manufacturers. Mistakes were made, and still are made. The order is strictly nonpartisan.

Q. Do you think this organization is stronger in its educational features than any other?—A. Yes. We have a lecturer whose business it is to instruct the different members of our order and get them to take part in its work. There is not one in twenty who does not become interested before they are members of our order for a single year. And after the men and women have been in the grange for one year, those who take part in this educational feature are fully 95 per cent.

Q. Do the themes you discuss relate solely to agriculture?—A. They relate to agriculture, domestic and political economy, and the duties devolving on us as individuals and citizens of the Republic.

Q. Is there an equal participation by the women in speaking, writing essays, and discussing home matters?—A. It has been my pleasure since I have been master of the National Grange to visit about twenty-five States. While in those States I have attended their subordinate, Pomona, and other meetings, and it is a great gratification to give evidence here that the majority of the attendants are of the gentler sex. They have regarded the grange as the organization specially friendly to them. Our wives and daughters need this sociability ten times more than the farmers and the sons do, and the grange furnishes it.

Q. Is it the moral element you cultivate to build up the American family?—A. Temperance is inculcated, industry fostered, and economy practiced. There is a strict observance of the usages of refined society and a moral feature that covers all. When women become members of the order and they see the improvement of conditions they become its warmest friends and most enthusiastic supporters. The building of homes where culture, refinement, devotion, and love for each other characterize each member, truly is a noble mission. A lady in Colorado said to me: "It is in the grange that I can be of more good to my locality and to my children than in any other department I have ever worked, because there is a moral atmosphere that surrounds the child that has a strong effect upon its future."

The order of Patrons of Husbandry speaks not as a partisan, because its members affiliate with the various parties. We do seek certain legislation that will be just to us and fair to all other classes. We take up these questions with great deliberation; we discuss them in our subordinate, county, State, and national grange. Then we try to secure that legislation along just and equitable lines. Our legislative committee felt profoundly gratified when this nonpartisan commission, as we understand it, was created. You are getting the facts relating to the needs and necessities of the industrial interests of this country and will make recommendations to Congress and the legislatures of the several States of this Union. We believe this is the best movement that has ever been inaugurated in this country to secure proper and just legislation to all the people. Facts have been wanted, and it has been our earnest desire that such a commission should be established. We are pleased to be called before you that we may, if possible, secure your cooperation in the enactment of such laws as, in our judgment, and we hope in your judgment after you have secured all the facts, will fill the agricultural needs of our time. We know and fully appreciate that the farmer can not be advanced beyond his just deserts without the injury of others, and the injury of others is reflected on the farmer. We understand that proposition, and hence we are conservative. Men of various opinions politically, we come as citizens hoping for the time when through the elevation of partisan politics every man will guide his action with a view to its effect upon the citizenship of the country, and not merely upon his party. We have legislative committees in every State of the Union that are seeking State legislation along the lines I have mentioned. Through our organization we can distribute facts to the people and make apparent the great importance of your work, and we hope that this commission will be one of permanent duration. I do not know what your plan is, but the commission ought

to be perpetual. There is no question about that, because you are in the way of getting the right kind of legislation. We believe that transportation to-day is one of the great questions affecting the various industrial interests of our country. It affects and touches every man in the country. Statistics show that 60 per cent of the freight upon our railway lines, our steamships on our lakes, and in the coastwise trade are the products of the farm. Equitable rates, just to the railroads and other transportation companies and just to the consumer and the producer, is a very important desideratum. We believe that a commission—if it be the Interstate Commerce Commission well and good—should have this whole matter in charge, and say and have the power to enforce that which is equitable between the shipper and the transportation companies.

As a farmer in Indiana I raise some wheat. If I have a few thousand bushels of wheat to send to New York and the matter was left entirely with me I would not make the cost of transportation too high—I would be sure of that. The probabilities are that my selfishness would bring it below what ought to be paid. If you leave it entirely to the transportation company the same selfishness obtains on that side as upon ours. If it is not fair to leave it to us it is not quite fair to leave it to them. We ought to have this special noninterested commission to fix the price. We think there ought to be legislation along that line; and we are profoundly impressed with the idea that if this commission in their investigations of these subjects should reach that conclusion the American public would approve their decision almost unanimously without partisan division, because in our judgment that would secure justice and equity between all the interests; and when you have a basis of equity you have subserved the best interests of the entire country.

The grange believes a great injustice has been done the farmers through the importation of shoddy into this country and the displacement of our wools. That has injured our market, and a wrong has been perpetrated upon the consumer as well as producers of wool by the manufacture and sale of cloth composed largely of shoddy. We believe that the men that pay the taxes in this country have a right to protection from imposition through the shoddy that is being put into goods. We have no objection to such cloth being sold, but we do not want it sold for a pure-wool article.

There is another question which, perhaps, is the most important. We need legislation restraining and controlling the growing disposition and grasping power of trusts in this country. We believe the liberty of the people is jeopardized by the growing power in this direction; we believe that the actual values of our property are in jeopardy through these combinations. If this commission should make no recommendation other than one to meet this evil through national and State laws it would have been the means of accomplishing the grandest achievement that has ever been reached by legislative bodies in this country. We can not imagine a better place where such laws should emanate than from a body of men like yourselves: because we know that men in Congress and in the legislatures who are elected by partisan influence and partisan control must necessarily be largely influenced by party interests. We hope to be able to make others see that this is a commission that has risen above partisan bias and seeks only the best good of the citizens of the Republic, and hence the laws that you would recommend could not be biased, or parties divide upon them from a partisan standpoint. Hence we have great expectations, and we have had confidence in the results that this commission is to bring about.

Q. (By Mr. RATCHFORD.) Do you feel that the value of your labor is also jeopardized by these trusts?—A. Yes; it is. We can not draw any distinction between labor and capital. Labor is capital, and capital is labor condensed and stored away. We believe the true interests of capital must be the true interests of labor. I do not believe you can separate them, if they are properly understood.

We also want a widening of the markets for the farmers. We feel that the great power of this Government and very large sums of money have been expended to widen the market for our manufacturing industries in foreign countries. We believe there should be no discrimination and that the same energies and efforts ought to be put forward by the Government for advancing the markets of agriculture in all foreign countries. Men in the consular service ought to be sent abroad with the view of ascertaining what the market requires in the various countries, the probable demand of this country for importation and the probable supplies it might have for export, so as to advise this country. Farmers are placed at a disadvantage, compared with the commercial interests of the country, because they are slower in learning the demand of the world for the products they have in hand than are the commercial interests. We believe it is within the legitimate province of the Government to protect all its citizens alike, and we believe that

no man should be appointed in the consular service who is not imbued with the importance of agriculture and the sale of agricultural products equally with manufactured goods. Our schoolteachers are examined to see if they are qualified to teach what we want. When we send a man abroad to look after our interests, we think he ought to be qualified for the position he holds, and that would advance and enlarge our markets for the products of the farm. We believe it is within the province of this Government to see that when any discrimination in any of the laws of foreign countries are made against the interests of the agriculture of the United States, this Government should protect us by proper methods.

Q. (By Mr. CONGER.) Do you think that the widening of the foreign market for manufactured products is of no benefit to the farmer?—A. In some lines it is a very serious damage to the farmer.

Q. Do you desire a widened market for farm products?—A. Yes.

Q. If we enlarge the foreign market for a given line of manufactured products, say, 50 per cent, so that where 200 men have been employed in this country, 300 will be at work, would that additional 100 men create an enlarged market for the products of the farmer?—A. That would widen our home demand. Yes; we are decidedly in favor of that. We do not want to curtail our manufactures a particle; no, not that. In fact, if we could get all the men in our own country making goods, so as to eat up all we can produce, it would be still better. It is a benefit, but it is only a relative benefit that does not come in the same degree that it does to the manufacturer. If they could also enlarge our market in an equal proportion, it would be an advantage to us equal to the advantage of the manufacturer. Our market is of equal advantage to manufacturers that the manufacturers' is to us, because, if we are more prosperous we can buy more manufactured products, and that tends to make a larger demand for the products of factories.

Q. (By Mr. A. L. HARRIS.) What are the particular lines of manufacturing in this country that injure the farmer?—A. That is the point. We send our best-made agricultural implements in large quantities to the cheap land and labor countries of the world, which are in direct competition with us in the markets of the world for the products that we produce. If we send one hundred harvesting machines to operate in the Argentine Republic, upon lands that stand at a valuation of only \$1 to \$5 an acre, and can produce substantially the same number of bushels of wheat as our land, and those machines can be operated by labor that costs no more than one-tenth of what our labor costs, and then the product of those farms meets our product in Liverpool and London, there is a competition which is injuring the farmers of the United States. There is not enough compensation or advantage coming back to us by the additional number of men employed in those factories, the feeding of which will not equal the loss that comes to us through the excess of production that is brought about by this improved machinery in Argentina, India, and Russia.

Q. (By Mr. CONGER.) Would that apply to the manufacture of steel rails?—A. Nothing of that kind. But I want it understood we do not object if the same push is used to get a market for agricultural products. That is an incident that can not be escaped; they do push their manufactured goods there; they push their plows; they push their reapers into those countries, and help the manufacturers to get a market, and they do not help us.

We favor the election of United States Senators by popular vote. I do not think any man needs any argument in favor of that after the experience of the last winter. It seems as though all legislation is stagnated in a great many States in which United States Senators are to be elected, and we would be wonderfully pleased to see the Constitution changed so as to get United States Senators nearer the people. The Patrons of Husbandry insist on amending the Constitution so as to require the election of United States Senators by popular vote.

Q. If agricultural machinery were not sold to Argentina and other agricultural countries by American manufacturers, would not the same machines be sold by European countries?—A. Yes; but not as good ones.

Q. Do they not make as good ones?—A. No; we make the best machines the world has ever produced. The European manufacturers are far behind us.

Q. (By Mr. FARQUHAR.) What other legislation do you favor?—A. We believe there is a growing tendency throughout the United States—in the Federal, State, and county services—to keep the rates of salaried men higher than they should be. We believe that the salaries of men should be commensurate, or in a degree commensurate, with the same class of talent and ability in private life, and should be in relation to the cost of living, and we believe that there ought to be a revision of salaries of county, State, and national officials. We believe, as has been argued, that the purchasing value of a dollar goes very much further toward a man's living than it did formerly; therefore the same salary, measured by the products that he uses to live, has been largely increased if the salary remains the

same. I remember when the salaries of Congressmen of the United States were advanced from \$3,000 to \$5,000. The argument was made that the cost of living had materially increased, and therefore justice demanded there should be an increase in salary. Now the reverse conditions have come why should not the same argument be applied? This would reduce the taxes upon the people. The burden of taxes now is of serious moment, and is affecting the people of this country. We are burdened with an unjust proportion of them, hence we think they ought to be reduced. An equitable adjustment of salaries would materially reduce the cost of county, State, and National Government. If this commission should make recommendations in favor of this reduction of salaries, it would not perhaps cause all these changes to be made, but public attention would be called to this matter, and I think it would eventually result in the readjustment of salaries.

Q. Have you taken into your consideration of this question the insecurity of positions under the Government?—A. We do not mean they should be graded to the same level as other salaries, but we believe they are now too high and should be reduced. We believe the extravagant style of living indulged in by public officers has an injurious effect on the public mind and should be discouraged.

Q. Do you think the remedy would be secured by endeavoring to get 8 hours work out of Government officers throughout the country and to do away with sinecures?—A. That would help and should also be applied.

Q. Do you think that one-third of the officials of this country are totally useless in the country?—A. I am not familiar with that. We increased the officers in our State 4,000. We got along without them before. The basis of salaries ought to be high enough to command the best talent of the country. We should pay a man well for his service, and then exact that service of him, and compel him to render honest service. If you favor the action I have indicated we can cooperate with you and create a feeling among the people—the voters, and the taxpayers along these lines—so as to reach Congressmen and members of legislatures everywhere.

Q. (By Mr. A. L. HARRIS.) Please refer to our plan of inquiry, Part I, on the subject of "Labor employed," and reply to such topics as you care to touch upon.—A. My observation is that there is about the same amount of labor employed as formerly. I did discover in every State that the farmer was so shaping his farm management as to employ continuously a certain amount of labor, so as furnish the laborer work all the time. In every place I visited the farmer was trying to make the employment of his help as continuous as it would be in the factory, and there is a general disposition to furnish homes for the labor, and to employ men who will live upon the farm.

The effect of improved machinery has not been to reduce the number of laborers so much as it has been to decrease the onerous work, lessen the labor, make it lighter, and very much more agreeable. Skilled labor is the kind wanted on the farm. If we could get skilled labor the demand would be much greater.

Q. (By Mr. CONGER.) What, in your opinion, is the condition of the laborers on the farm now compared with 20 or 40 years ago?—A. It is better in every way; in every conceivable way. They live better, their families enjoy life better; they have less hours of labor, and a great deal more freedom and privileges than they ever had before.

Q. What privileges do they enjoy?—A. The use of horses and buggies, the keeping of stock, the use of land for garden purposes, houses to live in, fuel, etc. The hours of labor are greatly decreased. I know of no exception to that rule. The tendency of agricultural labor to seek other employment arises more from the want of sociability than from any other one thing, in my judgment. I believe the wage rate that is being paid to-day for ordinary labor will allow the average man to save more money in a year and enjoy more comforts of life on the farm than can be done elsewhere by the same class of labor.

Q. (By Mr. FARQUHAR.) How does the amount of drinking among farm hands to-day compare with the usage 40 years ago?—A. My judgment is, there is less drinking to-day among the farm help than there was 40 years ago.

Q. What is the reason for that?—A. Higher intelligence, better opportunities for enjoyment, and a higher respect for a man's family.

Q. Is there the same crowding in the village cross-road saloon and the noisy demonstration of the early days?—A. To my intense gratification that is dying out in nearly all parts of the country. Only here and there does that old-fashioned custom of getting together and exchanging stories at night and taking a drink exist. It will in a short time be a thing of the past. I attribute that largely to the grange furnishing a counter place for these people to come together and enjoy and improve themselves.

Q. Is the farmer of to-day discontented with his lot?—A. The period of discontent is passing away, because the broader range of thought; the closer and better information that farmers have of the perplexities and the environments of other occupations and trades makes him better satisfied with his position. He knows that his lot is not so much harder than that of others. That is one of the things we have tried to inculcate in the farmer through our order. We have tried to show him that he must give credit to that home in which he lives; that he has for his table a far superior quality of food than the man who buys in the markets; that his buggies and carriages for his pleasure are worth money, and credit should be given to the farm for them. When they take into account those things, they see they have a value and that they cost the professional and business man money. Add these and many other items that could be mentioned to the account of the income of the farm, and they are better satisfied. The cash system is universal on the farm. There is a great tendency for cooperation between owners and the labor that operates the land. There is a universal sentiment that a basis of cooperation ought to be established. There are two plans that we are considering with a great deal of favor. The plan Colonel Brigham spoke of yesterday, of dividing crops, is one; and that, perhaps, is the one more generally in use. But there is another plan that is largely in use in our State and a great many Western States that I visited, and that is to fix an agreed value upon the property, and a tenant goes on it upon a fixed basis of rental. They agree upon a low rental and a low per cent. That has a good effect upon the tenant's mind, because if a tenant says "If you give me a share of the crop I don't know whether you are getting too much or too little." He is not satisfied; but if you have agreed upon a basis on which he is perfectly willing to give you 3 or 4 per cent for the use of the land he goes on and operates the farm, and you have cooperation of labor and capital; after the payment of rental and wages agreed the balance of the proceeds is equally divided. That system has been very successful where applied, and a great satisfaction has come from it, as you have agreed upon two important factors; one as to the per cent to charge for use of the money invested in land and what a man's labor is worth, both of which come out before you divide profits, and the man feels a little better. He feels a little more important. He is upon an equal footing with the proprietor of the land. Of course, if you get profits, that makes a larger percentage on your land, and the laborer gets more for his labor.

Q. Has the question of usury very frequently come before the Grangers?—A. Yes; the Grange has grown wonderfully on that line. The Grange has lifted people up, and the members believe that money is like other property—the rate of interest is fixed by the supply and demand. In our State we have a good deal of foreign labor. The question is as to the literacy and illiteracy of those people as compared with ours. The majority of foreigners that come in our country are well educated—fully as well as the same number of Americans.

Q. (By Mr. A. L. HARRIS.) What are their nationalities?—A. They are Swedes and Germans. They have a tendency to colonize, and wherever a German settlement or a Swedish settlement takes hold you will find an advance in the price of property.

Q. (By Mr. CONGER.) Do they usually become desirable citizens?—A. Invariably.

Q. (By Mr. FARQUHAR.) Do the Hollanders along the western shore of Lake Michigan stick together?—A. Yes; they take possession of the low lands, that others do not regard as valuable, and are making the best kind of farms.

Q. (By Mr. CONGER.) Are foreign languages and customs usually retained among the Hollanders in western Michigan?—A. Yes; to a large degree.

Q. Do they retain the language in the second generation; fail to become proficient in English?—A. Yes; usually.

Q. Do they educate their children in their own language or in English?—A. In English. We find it is impossible to compete with the Polish people in the markets. They are good farmers, and very industrious. These Polanders will have all their children employed at something. They keep up parochial schools. Very few send their children to the public schools. I suppose there are 750 Polish children in St. Joseph County.

Q. (By Mr. RATCHFORD.) Do you speak of a parochial school as a school for a particular religious training, or for teaching their own language?—A. It is a school for both. The elementary principles of an ordinary education are taught in all those parochial schools; the Catholic religion is insisted upon. We are becoming intensely interested on the question of taxation. We believe that we are paying more than our just share of the taxes. When the schedules were fixed years and years ago in our State and other States, the great bulk of personal property belonged to farmers. Then they fixed a schedule of a number of questions, which practically made an inventory of all his property. The other industries of

our country do not have to do that. They ask the merchant the amount of merchandise he has on hand in one line, and he states a given amount. The assessor has no possible way of verifying that statement, except in a general way; and it is true also of manufacturers. We believe that the farmers are just as honest as those engaged in other business, and we would like to see an effort made in every State to have tax laws uniform, making every man who owns property give substantially an inventory of his property, stating valuations. We believe there should be a change upon that basis. Either all should inventory their property or none. We find that the State boards of equalization in almost every instance have personal knowledge of the valuation of land, but no personal knowledge as to values of the different properties in cities of the country. Because of that I think great injustice is done the farmer, because upon a State board of review or equalization the farmers are often without representation and the boards are usually composed of a majority of men engaged in other pursuits. There is another injustice that comes to the farmer. I believe in our State we have \$1,200,000,000 worth of assessable property. Of this amount there is about \$539,000,000 of farm property, land, and improvements in the State, and the balance is composed of all other property. Of personal property there is about \$125,000,000. The railroad property and corporations have a little over \$154,000,000. So that, as compared with the other class of property, and disregarding railroad property, we have a higher valuation than all in the balance of the State. As a matter of fact we are of the opinion that the other property is worth at least 50 per cent more than ours if put upon the market to sell. Colonel Brigham stated yesterday that he knew from his personal knowledge that property based upon a rental value was assessed about the same rate as it would be in the country with half the rental value. That is nearly true in our State; I think it is pretty generally true in most of the States. I believe it ought to be the law.

Q. (By Mr. CONGER.) Would the higher rate of municipal tax for street improvements, etc., as compared with the township tax, in a measure equalize the difference in the general taxes?—A. If there is not a compensating advantage for municipal tax, there is no justification in making it. You can not tax people for a sewer or pavement unless there is a compensation coming directly to them.

Q. How are the railroads taxed in your State?—A. They are taxed upon valuation of the property as other property is taxed, except that the valuation is fixed by the State board of review and not by local assessors.

Q. How is the rate determined?—A. That is not done by the assessor, but by the State board of equalization. That is done to make it general. The rate is fixed as are all other rates. The State makes the rate for each county; then the State auditor sends to each county the number of miles of road or track in said county.

Q. How long has the present system existed in Indiana?—A. This system of taxation has always been in vogue. The system of finding valuations has been in vogue about 10 years, but the system of taxation has never been changed.

Q. Did you about 10 years ago evolve a new system of fixing the value?—A. Yes.

Q. Did the inauguration of that system increase the tax of railroads?—A. Yes; from \$66,206,000 to \$161,039,000. The matter was carried into the Supreme Court, and the decision was rendered about a year ago compelling the roads to pay upon the higher valuation. The present valuation is not regarded as at a higher ratio than other property is assessed.

Q. (By Mr. A. L. HARRIS.) In reaching that valuation, does your board take into consideration the visible property?—A. Yes; they don't consider the stock. There is no corporation in our State that is assessed by the stock; it is the visible property.

Q. If one road is profitable and another is not profitable, does that make any difference?—A. Yes. It is the value of the road; what it will sell for.

Q. (By Mr. CONGER.) Does the board of assessors have authority to take into consideration the value of the stock and the capitalization of the road in fixing the value per mile?—A. Yes.

Q. Do they take into consideration the market value of the stock?—A. Yes. That is one of the means used in finding the value of the road per mile.

Q. Do they take into consideration the earnings of the railroad?—A. Yes.

Q. (By Mr. FARQUHAR.) In Indiana is everything the railroad owns scheduled for taxation, even if it be to the value of \$5?—A. Yes. Even the tools that the track men have are all listed and put down; that is right. There is no injustice between these classes if the railroad property is assessed at as high a rate as farm property.

Q. (By Mr. A. L. HARRIS.) What do you do in your State with the class of property the Pullman Palace Car Company uses?—A. We have various rates on

cars, according to value and the line they run over, and then we charge them the same rates pro rata. That is the only equitable basis we could devise and I think it is a fair one. We took the telephone and the telegraph lines. Under the new law their assessments were largely increased.

Q. Do you tax every pole they put up?—A. The number and quality of the poles and the number and quality of the wire are taken into account in fixing the amount of assessment per mile.

Q. Would you take into consideration the length of time the poles had been standing?—A. Yes. We consider the life of the pole to be a certain number of years, and that the value of the pole would decrease as the years go by, and we take into account the various kinds of wire that they use, and that is a very material thing.

Q. Do you consider your system of taxing this kind of property such that you would recommend it to other States?—A. So far as those two classes are concerned, it operates well in our State.

Q. (By Mr. FARQUHAR.) What is the general opinion among the railroads that are taxed, with respect to this system of taxation?—A. I do not think they are very much in love with it. They are getting to like it better than they did. My opinion is that if you make a fair valuation of property, you will unearth a great deal of property that is now hidden. There is no question about that. When a man has property and sees inequalities of taxation, he feels himself justified in making some little secretions of property. That is one of the causes. The prejudice that prompts the idea that a man who has a \$10,000 note shall be assessed for \$10,000, but that the very moment that he trades it for a house it shall be assessed at \$5,000, or if he should buy \$10,000 worth of paid-up life insurance that has a fixed surrender value at all times, it is not assessed at all, does not meet a responsive acquiescence in by the man who owns that \$10,000 note. I believe that if all property would be equally assessed or fairly assessed there would be much less property hidden and much more property would be listed for taxation. The laws as we have them now are not always carried out.

Q. Would a fair assessment lower the taxes of the farmer?—A. Taxes would be lowered one-third if all property was fairly assessed—if all property were compelled to pay its just proportion of taxes.

Q. (By Mr. CONGER.) What suggestions have you to offer for the unification of tax methods?—A. In the first place, I should make the suggestion that the assessment law should be uniform—either all shall furnish an itemized inventory of property or none. It matters not in what kind of property one's possessions should be, it should all be on a uniform basis. The law now requires property to be assessed at its actual cash value. The interpretation of the law in different States differs as it does in different parts of the same State. The interpretation of the law in the State of Indiana means about 66 per cent; the interpretation in Ohio is about 40 to 50 per cent. I recollect very well a case at Toledo. One of the national banks was assessed 100 per cent. They carried the case up and got a decision that they should not be assessed over 40 per cent. I think it might be provided in the law that all classes of property shall be upon the same ratio. I think that should be in the law. For instance, in Chicago property is assessed at a much lower rate than the farm property of Illinois.

Q. (By Mr. RATCHFORD.) Do you favor the single tax on land?—A. I am in favor of assessing values upon every kind of property, improvements as well as land. I do not believe in the single tax at all.

Q. Do you believe that railway property should be taxed according to its value per mile, or on its gross or net earnings?—A. I think it should be assessed upon its value per mile.

Q. Its value determined by its business?—A. Determined by what it will sell for—determined as you would any other value.

Q. Is it a fact that the selling price is determined by the business of the road?—A. That may be, but the buyer reaches that point. I do not believe in making two standards of value. I am decidedly opposed to making one standard of the earning value and another of the selling value, because there is a liability of much inequality and dissatisfaction growing out of it. A man wants to sell a piece of property that does not return as much income as another piece of property; that makes the property less valuable; it sells for less money, and hence should be appraised for less. He can own any kind of property, but let every dollar of the property, whether it be in the corporate limits of a city or town or in the country, one kind of property or another, bear an equal and just share of the public burden, because it is protected by the laws of the State the same as any other property. I do not mean that country property should bear any part of municipal taxes.

Q. Do you believe property should be valued for taxation exactly at the price it will sell for?—A. I don't say it should be valued at the price it would sell for, but it should be on a basis of equity with other property, whether the valuation is at its full selling price or based upon percentage, a percentage of that price. The fact of it is, it would make no difference. As the interpretation of the assessors has been upon the selling value, it has never been enforced anywhere.

Q. Do you believe in taxing the incomes of men who have no visible property but who have large incomes?—A. Yes; I would favor an income tax.

Q. (By Mr. CONGER.) What kind of income tax do you favor?—A. A graded one.

Q. (By Mr. FARQUHAR.) Do you think it would be possible to make an equitable income tax in the United States?—A. Possibly not; but it might be made as equitable as any other tax.

Q. (By Mr. RATCHFORD.) What are your views on the subject of taxation of inheritances?—A. I am opposed to that. I do not believe an inheritance tax is the proper thing. If a man has paid his taxes fairly to the time of his death, there is no reason why we should take from his children a proportion of the property he leaves.

Q. (By Mr. CONGER.) Are you of the opinion that a majority of the men worth from \$50,000 to greater amounts usually pay their full share of the taxes?—A. They may or they may not. They may have paid a good deal more. I believe I can name a number of farmers who are worth \$50,000, and if they had their just deserts the State would pay them the unjust amounts collected from them, instead of taking money from their children. Therefore, it would be an injustice to that class of men.

Q. (By Mr. FARQUHAR.) When you come to the concrete of the whole question, do all taxes come from wages?—A. Yes; labor pays everything.

Q. Is that the general law that governs all civilized mankind?—A. It comes back to that.

Q. Are not the millionaires and multimillionaires taxed equally with the workingman and the farmer in the ramifications where their wealth and capital are invested?—A. I think not. National securities are not taxable, as are the municipal securities of our country, which are very large. I am of the opinion that a large proportion of these municipal securities are not taxed because you can not find them. As a rule that kind of property is not found by the assessor, and the men who own the bonds do not pay their just proportion of the taxes.

Q. Is capital, whether of savings banks or not, that is loaned on first and second mortgages in Indiana taxed?—A. It should be.

Q. Are the savings banks chartered by the State?—A. Yes.

Q. (By Mr. KENNEDY.) When you say you favor a uniform income tax, do you mean that the income of all people should be taxed?—A. I can see no reason why one man's income should not be taxed equally with that of another, except small incomes, which should be exempt.

Q. Would some men's incomes bear any taxation?—A. No; those with very small incomes need it all to support their families. Some men's incomes arise entirely from rents of property, which property is already taxed, while another man's income arises entirely from his profession. In that case the one really has to pay two taxes, one on the property and one on an income.

Q. Do you think that the cost of an average living should be eliminated before a man's income is taxed, if we are to have an income tax?—A. Yes.

Q. Could a track man working on a railroad at \$3 a day afford to pay an income tax?—A. No.

Q. Is your national organization on record in favor of a graduated income tax?—A. Yes.

Q. (By Mr. A. L. HARRIS.) We will proceed to No. 31 of the syllabus: "The decline in money value of agricultural lands in the older States—causes and extent of."—A. There are two causes for the decline. One is the decline in absolute intrinsic value, because the fertility has gone out of the land through bad management. Another cause is the unnatural development of this country. There is an unfair competition upon the agricultural worker in the unnatural development of our Western frontier. The pushing through of the Northern Pacific Railroad, the giving away of this land, the discriminating charges that have been made by the railroads, carrying the products of those cheap lands to the East for less money than they were carried from the older Central and Eastern States, has caused a serious and depressing effect. In the eighties it was no uncommon thing to carry wheat from Dakota to New York for from 10 to 15 cents a hundred less than it was carried from the Central States. That had a serious and depressing effect on our land, and accounts for much of the shrinkage of values in the older States. The development of the cheap land and labor countries, and the shipping abroad and

the use of our fine agricultural machinery in those cheap land and labor countries is another cause that has depressed agriculture in the United States. I regard bonanza farming as having some effect—the same effect, upon ordinary farming that the large manufacturing establishments are having upon the smaller factories of the country: Especially is this true in stock raising. If that same land now used for bonanza farming were handled by small farmers it would make a competition still more difficult for us to meet.

Q. (By Mr. RATCHFORD.) Why would the competition be greater if the bonanza farms were divided?—A. Simply from the fact that the same number of acres in smaller tracts, managed by the owner, will produce more than any of the bonanza managers are able to do, and hence we would have a larger quantity.

Q. Would the methods of production be the same as they are now if those farms were split up?—A. I presume not.

Q. Would that not tend to counteract the present difficulty?—A. The tendency of that would be to relieve one particular crop, perhaps, but while you relieve that you make a pressure upon the others which would equalize it and amount to the same thing.

Q. If those farms were divided into ordinary sizes and farmed by as many farmers, could the steam plows and other improved devices of agriculture be used as at present?—A. Not to that extent, but when the bonanza farm is divided into 80-acre tracts each is worked by the farmer himself. The bonanza farmer has to hire men to do his work. Many a man runs a farm and says he can not hire a man to do the work, but that he can do it himself, because he must make a living. And that makes a competition that is harder to meet. If you have all hired men, your theory of reasoning would be correct; the small farmer does his own work.

Q. Is it true that where manufacturing is carried on upon a large scale the expense has always been lessened?—A. That is true of manufacturing, because you can bring that to a system, but there are factors in farming that make it more difficult to bring under the rules that apply to manufacturing industries. On the small farm you get the advantage of intense application and personal interest. I will say further that if one-quarter of the tillable soil of this country could be converted into forest, that the remaining three-fourths would produce more than the whole at present. I do not think we have developed to-day over 50 per cent of the productive qualities of our soil.

Q. (By Mr. KENNEDY.) Do you think the farmers in Ohio and Pennsylvania have any right to complain of the competition that comes to them from the farmers, with 160 acres of land, in the Dakotas or Kansas?—A. He has no right to complain of the farmers, but he has a right to complain of the system by which it was brought about. I will admit that I was one of those in favor of that; I thought at the time it was a good thing to do. I was in favor of the appropriation to push forward the Northern Pacific Railroad, and I favored the homestead law, but I now see we made a mistake. It brought upon us a competition that is ruinous to us in the Central States. The same argument applies to the great irrigation system proposed to be taken up by our Government. Three or 4 years ago I was in New Hampshire, and while we were sitting in the hotel a gentleman introduced that subject. He said he would favor that sort of thing and that it was a great thing because it would relieve and develop that country and make it a garden spot; it would relieve the plethora in our cities; relieve the manufacturing districts of the surplus labor and so on, and they could grow crops there continuously, rain or no rain. "Well," I said to him, "I do not want to get into this discussion, but you have a printing establishment across there?" "Yes." "You employ a good many men?" "Yes." "Suppose the Government sets up one right beside you, and puts it in there and pays the expense. Do you think that is a fair competition between you and them?" He said, "No, it would ruin me." "That is just what you propose to do in the West. Is that a fair competition? You propose to let them raise crops, rain or no rain. That is the principle underlying this Government irrigation scheme, and so far as my influence can extend I shall try and do everything in my power to prevent this Government building up an unhealthy competition to help somebody else and increase the value of their private property at the expense of the farmers.

Q. (By Mr. FARQUHAR.) Do you prefer a more natural development?—A. We like a natural development.

Q. (By Mr. KENNEDY.) Did the Senators from the East who opposed Governmental aid in irrigating the arid tracts of the West have any sympathy from organizations of farmers in defeating the efforts of the Western Senators to secure such aid?—A. Yes; they had our sympathy. The lines would be drawn on men who propose to put in that unhealthy competition, whether we are Democrats or Republicans. Referring to No. 39 of the syllabus, "Diversification of agricul-

tural industries," we favor that to the largest and fullest extent. We favor it on the ground of the markets and on the ground of maintaining the fertility of the soil.

Q. What is the attitude of the farmers of the United States toward the question of national expansion?—A. The attitude of the farmers on this proposition is one of investigation and study. The farmers do not like to take a position until fully informed. They are a little slow in reaching a conclusion, and they want to know all the facts and conditions, advantages and disadvantages, that grow out of the matter before they make up their minds. The case is in the hands of the jury, and they are not yet ready to make a report. That would be my judgment. The question of good roads is of great importance to-day. If you build good roads all over the country, every dollar that could be wisely and judiciously expended for that purpose would return to the owners of the farms and the people of this country 200 per cent, at the lowest. It is the most important thing I know of; it would aid in giving us free rural mail delivery; it would promote sociability in the country; it would give us the facilities by which we could reach the markets at any time, so there would be none of those fluctuations and variations because of the stoppage of transit from the farms to the markets. It will prevent and largely stop the storage of the farmer's product in the elevators. Storing their product in these elevators and warehouses is a very unwise thing for farmers to do, and it largely comes from the fact that when they want to sell they can not get to the markets. If the farmers of this country would build their own storage houses and keep their products on their own ground, it would disarm the gamblers in the markets of New York and Chicago and all over this country. Good roads would help us along that line.

Q. (By Mr. FARQUHAR.) Do you think the farmer ought to have an opportunity of putting his product into the market 10 months instead of 2 or 3?—A. Yes, 12 months in a year. A good manufacturer always furnishes storage for the product of his factory until consumptive demand requires it. The good business man furnishes storage capacity for his goods until consumptive demand requires it. There was in 1895 123,000,000 to 128,000,000 of bushels of wheat stored in public elevators for sale to Europe. This had the effect of depressing prices. The same amount of wheat in farmers' granaries on their farms would not have had so great an effect. This would relieve us of the large expense for insurance and storage, which the farmer has to pay. A man buys grain to carry until August and May. There is a storage account and insurance account that must be paid, and it is taken out of the price of the product. It does not cost half so much to insure property on the farm as in the city.

Q. (By Mr. KENNEDY.) Do you favor the collection of tolls on roads?—A. No; make them free as air. We believe that all combinations to arbitrarily control prices should be put down by law. We believe they are wrong. We believe they are injurious and against public policy. Cornering the market, which is done frequently, is injurious to the entire public, and very injurious to the farmers, and it gives rise to gambling in grain. We believe there ought to be a law to prevent gambling in grain. We have a system of public elevators in this country. The controllers and lessees of those elevators claim the right of buying and storing their own grain in elevators controlled by themselves. It has been charged they mix higher with lower grades. This is another injury to the value of all better grades of grain. We believe there ought to be a law to prevent this practice. I believe there is a case in the Supreme Court from Chicago on this point.

Referring to No. 49 of the syllabus: I insist that pure food is absolutely essential for our markets. When I was in Wisconsin last fall one traveling salesman informed me he had sold 10,000 barrels of so-called maple sirup, and that the factory where it was made had no connection with maple trees, thus displacing the sale of 10,000 or more barrels of pure maple sirup, and also destroying the demand on account of these adulterated compounds. It shuts off the market for our maple sirups, and thereby lessens the income of our farms. And the same thing is true in regard to vinegar. The value of our orchard products is materially lessened by acid vinegars. So all along the line, the market for the pure article of the farmer's products is materially reduced by the sale of these adulterated articles, and we ought to have protection for our markets. In 1890, when we shipped our cheese to England, we sold it for as much as Canadians could sell theirs, but after the introduction of the filled cheese in this country and the want of proper inspection here and the close inspection that was had in Canada, Canadians could sell cheese for 2 or 3 cents a pound more in the English market than we could, simply on account of adulterations of cheese in this country. Hog lard, being adulterated with the oil of cotton seed, very materially injures the product in that line. This is the point we want to make. We are entitled especially for

that kind of protection that will protect the markets that we have got. We build up a demand for our product only to be destroyed by adulterated articles put in place of them. It is a fraud that the laws of this country should punish severely. The health of the people is seriously imperiled by the poisonous substances that often enter into these adulterations. The consumer is entitled to get what he buys and pays for.

Q. (By Mr. A. L. HARRIS.) What national pure-food legislation do you favor?—A. We favor the bill that was before Congress last year—the Faulkner bill. We think that covers the ground so far as national legislation is concerned. It should be supplemented by State legislation.

Q. What State has the best law on the subject of pure food?—A. I have not examined the laws of all the States and therefore could not say which has the best laws. But in the interest of honesty, in the interest of the health of the people, the demand for effective legislation is imperative, and we will look to this commission to recommend such laws, Federal and State, as will effectually prevent the sale of adulterated foods as pure foods.

WASHINGTON, D. C., March 14, 1899.

TESTIMONY OF MR. N. J. BACHELDER,

Master of the State Grange, Patrons of Husbandry, of New Hampshire.

The commission met at 10 a. m., March 14, 1899, Mr. Farquhar presiding. Mr. N. J. Bachelder, Concord, N. H., master of the State Grange, Patrons of Husbandry, of New Hampshire, testified at 2 p. m. The topical plan of inquiry relating to agriculture was followed during the examination.

Q. (By Mr. FARQUHAR.) Please state your official position in the order you represent, your general experience, and whether you are a practical farmer.—A. I have been master of the State Grange for 7 years; secretary of the State board of agriculture for 12 years, and a member of the executive committee of the National Grange for 8 years. I am a practical farmer.

It seems rather unnecessary for me, coming from a section that is not specially known for its agriculture, to take any active part in this discussion. I am connected with an organization, as has been previously stated, where there is no sectionalism—no North, no South, no East, no West—and although some things that have been asked for by my associates on the committee, and some of the conditions they have described are not applicable directly to New England, I am sure I am just as earnest as they in making the requests they make. This is one of the leading principles that is taught in the organization which we represent.

Q. (By Mr. A. L. HARRIS.) Were you a member of the legislative committee of the National Grange?—A. I am a member of the legislative committee of the National Grange, and appear here in that capacity.

Q. Please take up the plan of inquiry and reply to such questions as you desire to answer.—A. The farmers of New England are dependent upon local markets for the sale of their products, and any legislation or any action that would tend to develop those markets would tend to the prosperity of the New England farmer. The farm products that we send outside of New England for sale are very limited, and consist principally of fruit and potatoes and something in the dairy line. In order to have an intelligent understanding of the conditions there, perhaps it might not be out of place for me to refer to the subject of the abandoned farms, that has attracted considerable attention throughout the country. There has existed a very indefinite idea in the minds of many people as to the conditions which we are trying to change. The letters that we have received have indicated that many people suppose there are large tracts of land that are offered by the State; that the people had abandoned them, and the titles had reverted to the States. Such is not the fact. The abandoned farms about which this discussion has arisen are farms that are owned by individuals. They have been abandoned in the sense that they have ceased to be occupied, and the causes that have led to that have been several. Chief among them is the development of the West, and the taking of our young men from these farms to aid in the development of the Western country. Then there has been a desire for more social enjoyment than has been available on the farms, and young people have left the farms to go to the cities and villages where they could have better social facilities. The farms which we have advertised and to which we have called attention are farms upon

which are buildings fairly suitable for occupancy, but which have become vacant. I can speak quite accurately upon this matter, for it was my privilege to draft the first bill which became a law in New Hampshire 10 years ago, in the beginning of this movement, and which was afterwards adopted in modified form in four of the other five New England States. A canvass of the State of New Hampshire, and I think about the same proportion exists in the other New England States, revealed the fact that we had about 1,000 farms upon which were buildings suitable for occupancy, but without occupants. This is in a State of 32,000 farms. I think the same relative condition existed in other New England States. This does not include lands which have been more completely abandoned, upon which no buildings exist. We have certain sections upon the tops of hills and on the sides of mountains, remote from railroads and not workable by farm machinery, where there were farms, once occupied by thrifty, successful, contented farmers. Many of those places have not only become abandoned, but the buildings have decayed. They are growing up to wood and timber, and no use is made of them except for pasturage. That class of land is not included in the 1,000 farms which I named as having suitable buildings. The causes which have brought about the abandonment of those lands I believe to be the changed condition of the times, and under the present circumstances they could no longer be made profitable for cultivation. When the land was new, although the soil was thin, it possessed considerable fertility and afforded a satisfactory living to the people who occupied these farms, but in later days we are not satisfied with the living that satisfied people 50 years ago. The demand from the West took the energetic, active, intelligent boys and girls away, and when the old people died the farms were left, and buildings went to decay; they had served their purpose in their time, but could no longer be made valuable for agriculture. They were not adapted to the use of agricultural machinery, and consequently could be of no use except for growing wood and timber. I presume this has no bearing upon the work of your commission, but being a subject about which so much newspaper comment has been made, I have been induced to make this statement.

Q. (By Mr. CONGER.) Are the 1,000 farms you refer to being utilized for the cultivation of crops, for grazing, or other purposes?—A. They are utilized for grazing; the fruit growing on them is gathered, and in some instances grass is cut for hay. During the past 10 years 75 per cent of those farms in New Hampshire have been taken up and are now occupied. This movement was inaugurated by the State, believing it to be for the interest of the State to have the farms occupied, because if a farm is unoccupied it decreases in value each year; if occupied, it would probably hold its own in value, and the crops it would produce would not materially affect the local market, upon which we depend. These farms have been taken up by two classes of people; one class that came there for farming, and the other that has purchased them for summer homes. The latter class is composed of people from cities and villages in various sections of the country. I can name a single township, a township without a village, with nothing but farming land, that during the last 10 years has doubled its assessed value from the sale of farms for this purpose. When these farms are taken up to be used as summer homes the owners will frequently spend \$3,000, \$4,000, or \$5,000, in addition to the purchase price, in improvements, and, instead of coming in competition with the farmers in the production of crops, they make a market for their products. Not very long ago I made an investigation of the result in 10 townships where this movement was the most noticeable, and I found that every one of those townships in the past 10 years had increased in the assessed valuation of its real estate. Ten townships, of about the same agricultural facilities naturally but with no summer business, had decreased in assessed valuation during that time, showing that this movement had materially advanced the valuation of the property in those sections.

Q. (By Mr. A. L. HARRIS.) How do you maintain the fertility of the farms you are occupying and using for agricultural purposes?—A. The fertility of some of our farms has been exhausted by the selling of crops, but the intelligent, progressive farmers of the State practice a system of farming that maintains the fertility. The farms located near the cities and large villages are more productive to-day than they ever were in the past, but that is not true of farms in general. They are not generally so productive as they were 40 or 50 years ago.

Q. Do you use barnyard or commercial fertilizer, or both?—A. We recommend both. Farmers are buying chemical manures, and mixing the nitrogen, phosphoric acid, and potash themselves.

Q. Do you experiment upon your soil to know what it needs?—A. That is the principle upon which we work and is what we advocate.

Q. Are the rudiments of chemistry sufficient for that purpose?—A. It would

require a skilled chemist to make an analysis of the soil, but the process which we recommend, and which is practiced, is experimentation by growing crops upon the soil with different elements of fertility applied, and if the nitrogen gives better results than phosphoric acid, or potash better than nitrogen, it is an indication what element of fertility that soil requires.

Q. What are your hopes of the future for the production of your soil under skilled treatment?—A. We think the better class of farms will improve. The farms that are best located, nearest the markets and that have the most summer-boarding business, will increase in productiveness. Any legislation that will give us an increased and more active local market will benefit our farmers. We have sought to supplement the market we have in cities and villages by developing the summer-boarding business and by encouraging wealthy people to buy our farms.

Q. Have you any truck farming?—A. To some extent, but the market for it is confined mainly to the cities within New Hampshire.

Q. What prices do your local products bring in your local market?—A. The price of those articles that are not produced in sufficient quantities to supply the demand is regulated by the price of the portion brought in to complete the supply. The price of those articles of which there is a surplus is less than the price in the market where the surplus is sold.

Q. Is it the native American who has redeemed these abandoned farms, or is it the foreign immigrant that is helping you to redeem them?—A. I think it is generally the native American, although some foreign element has come in.

Q. (By Mr. CONGER.) What is the nationality of those who have taken up these farms for purely agricultural purposes?—A. Generally, Americans.

Q. Where do they come from?—A. They come from all sections of New England, and, to some extent, from different sections of the country. They frequently are people who were formerly residents of New England, who have been to the West and returned to their homes among the New England hills, where they were born and for which they never lost their regard. In some instances people come from cities to take up these farms, who have not previously been engaged in farming.

Q. (By Mr. A. L. HARRIS.) Have you anything to say in regard to the condition of farm labor in New England?—A. I think the condition of farm labor is better than at any previous time.

Q. What is the money value of farm labor?—A. The most of the farm labor is employed by the year. It is not practicable to depend upon transient labor, and the farmers have made their operation such that they can employ labor by the year; in winter time, in cutting wood and timber, taking care of the stock, and of the dairy. The price is about \$25 a month.

Q. (By Mr. KENNEDY.) Who holds the title to the abandoned farms?—A. Usually people in New Hampshire.

Q. Do they keep the taxes up?—A. They keep the taxes up.

Q. What are the prices of those lands?—A. They vary according to their distance from a railroad and their scenery; many of those places are located on the hillsides where they are very desirable by city people for summer homes, and in these instances, the fertility of the soil has very little to do with fixing the price.

Q. Are the houses on these farms habitable, as a rule?—A. Yes.

Q. Are the farms sold at a low rate?—A. At a low rate.

Q. As cheap as Government lands in the West, \$1.25 an acre?—A. Land which is not tillable, probably could be bought at that price, but tillable land would command a greater price than that.

Q. Is an abandoned farm considered tillable at present?—A. Some portions of these farms are tillable. These farms differ from the farms in the West, inasmuch as a farm of 120 acres might contain 40 acres of tillable land and the balance pasture and wood land, so that when we speak of a farm by its acreage it is no indication of its value for agricultural purposes.

Q. (By Mr. A. L. HARRIS.) Are these abandoned farms purchased by the persons who build the cottages, or are the cottages built by the original owners of the land, and rented?—A. The cottages and houses are built by parties who purchase the farms.

Q. Does the man who owns the lands and builds the cottage generally occupy it?—A. The man who purchases the land and builds the cottage generally occupies it himself. We have summer hotels in the State that will in the aggregate accommodate 80,000 people. Those people who do not purchase farms usually stop at those places.

Q. (By Mr. FARQUHAR.) So that these farms are occupied without much advance of agriculture in your State?—A. Not much advance in agricultural productions.

Q. Can you state the reasons that caused your New England farms to be abandoned?—A. I think the principal cause was the opportunity that was opened up

in the development of the West for our young, energetic men to go there and better themselves by the opportunity that was given for extensive farming, and better promise of large financial success than upon the farms in New England.

Q. Did you, in New England, have a good fighting chance in the markets before the great agricultural development west of the Mississippi and Missouri?—A. I think we had a better chance in staple agricultural products than now.

Q. Did you have a large market in Boston and at the same time an export market there for a time?—A. Yes.

Q. About what time did the abandonment of the New England farms begin?—A. I should say it began about 50 years ago. There is no abandonment of farms going on now; it has been checked; the tendency is the other way. People are coming back into these country towns, and are better contented and better satisfied with what they are doing than they have ever been before. I do not mean by that they are making any more money, but they are getting a better living—they have better horses, better carriages, wear better clothes, go to the city oftener. This is largely the result of the work of the grange. There is no territory of equal area in the world that has a more thorough farmers' organization than we have in New Hampshire, and the educational and social work that organization is doing there is accomplishing wonderful results in increasing the intelligence of the farmer, and causing him to appreciate advantages around him that he did not see before.

Q. What is the relative taxation of farm property in New England compared with other kinds of property?—A. I have not the exact figures to give the commission, but my opinion is that it is higher than the taxation upon city and village property. I believe that many of our farms remain upon the tax list at the rate fixed years ago, before the deterioration in fertility and before they were reduced in value, and they are paying tax on a larger assessment than they would sell for.

Q. (By Mr. A. L. HARRIS.) How often do you fix valuations?—A. Our valuation is fixed by a board of assessors in the town. They go around annually, on the 1st of April, and make the assessments. We have a State board of equalization, which regulates the rates of assessment between towns and cities, but does not regulate rate of assessment between individuals. That has to be fixed in the local board that makes the first assessment.

Q. (By Mr. FARQUHAR.) Are the owners of these abandoned farms living in New Hampshire now?—A. They are generally living in New Hampshire.

Q. Are they usually well off?—A. Some have retired with a competency.

Q. Is there much nonresident ownership of farm lands there?—A. Not very much. The farms upon which there are no buildings have usually been sold to some farmer owning adjoining land and used to help out pasturage.

Q. How about mortgages in your State?—A. We have some.

Q. On farm property?—A. Yes.

Q. By whom are they held?—A. They are held by individuals and savings banks.

Q. (By Mr. A. L. HARRIS.) What is the school age of children in New Hampshire?—A. They are required to attend school at least 12 weeks a year, from 5 to 14 years of age.

Q. How long may they attend school?—A. I think there is no limit. They may attend as long as they desire; usually till 16 or 18 years of age.

Q. What have you to say in regard to the sufficiency of your public-school facilities, as to houses, teachers, and the size of your districts?—A. They are not what they should be.

Q. What are the public-school facilities in New Hampshire?—A. I think our school facilities in the country towns are not what they should be in the matter of schoolhouses or in the efficiency of schools, but we are gaining in this respect; we are improving, and we point with pride to the schoolhouses in some of the towns, and believe that through a movement that has just been inaugurated our organization will aid the rural sections of the State in educational facilities more than in any other way. We believe in teaching the principles of agriculture in the country schools. Not that we believe in showing a boy how to plow and hoe and plant and cultivate, but that we believe the principles of agriculture can be used for mind development in the country schools to a reasonable extent.

Q. Is your public-school course sufficient for the needs of your people?—A. It is not in all instances.

Q. In what ways do you consider it deficient?—A. It is deficient in the matter of proper supervision, and also deficient in the length of school year.

Q. Should the technical education of the farmer be pursued beyond what he can ordinarily get in the common school, or do you think a sufficient education

can be obtained in the public school?—A. Oh, no. He should go beyond what can be had in a country school. He should go to the agricultural college.

Q. Have you an agricultural college?—A. We have an agricultural college in each of the New England States.

Q. Are those colleges devoted wholly to the teaching of agriculture and mechanic arts?—A. In the State of New Hampshire it is devoted to teaching agriculture and mechanic arts. I think it is devoted to that in all the New England States. The suggestion that I would make is, that agriculture is not made prominent enough in those institutions compared with the mechanic arts department. I believe that when a boy goes to one of those colleges and studies agriculture he should be made to feel that he is taking the leading course in the institution, and the influence in those institutions should be stronger toward the agricultural departments than it was intended when the colleges were established.

Q. To what extent are the mechanic arts taught, to qualify one for mechanical or factory work?—A. I understand that the mechanic arts department does qualify people for that kind of work.

Q. Have you any special chairs in your agricultural college for the different mechanic arts, such as the making of textile fabrics, the production of good dairy products, or things along that line?—A. Our institution is not classified to that extent. We have different courses in engineering, and we have agricultural courses. But what I would like to see in our New England agricultural colleges is an influence that would attract boys to study agriculture and return to the farms, and exert an influence in rural towns that in a few years would elevate the whole business of agriculture to a higher plane.

Q. What becomes of your farmer boys after they go through the course in your agricultural college?—A. Some of them return to the farm, but generally they do not.

Q. Why is that?—A. These agricultural colleges, so called, were established at a time when there was very little interest among the people in agricultural education, and when there were not many people qualified to instruct in agriculture. There were not many text-books in agriculture, and under those circumstances they drifted into the mechanic arts line more than into the agricultural line. Having been developed in that direction it is difficult to develop great enthusiasm in agricultural instruction in these institutions.

Q. Does your agricultural college teach the classics as well as agriculture?—A. I think not.

Q. Then it does not go to the extent of the university?—A. It does not.

Q. Where is your college located?—A. Our college is located at Durham. I would not like to have it understood that I am making these recommendations based upon our college in particular, but upon our agricultural colleges in New England as I know them.

Q. What is the attendance at your agricultural college?—A. About 100.

Q. What facilities has that college in a financial way and for taking care of the students?—A. Our college has an income of about \$50,000 a year.

Q. Is a part of that raised from State taxation?—A. About \$10,000 from the State.

Q. Was the money raised from an original land grant?—A. And from subsequent appropriations made by Congress and the State legislature.

Q. Is that money devoted to agriculture and mechanic arts?—A. Yes.

Q. Have you given the subject of trusts any consideration?—A. I have not given it sufficient consideration to be able to add anything of interest to what has been said by Mr. Jones and Colonel Brigham. I indorse what they have said about trusts.

Q. Did you ever, previous to the passage of the interstate-commerce law, have to pay more for a short haul than you paid for a long haul?—A. Yes; we had some trouble in that respect, and desire to have the law amended and the commission given power to remedy evils, which they are not able to do now.

Q. Have you any suggestions to make as to the oleomargarine law?—A. I desire to request the enactment of the bill that was introduced into Congress at the last session, imposing a tax of 10 cents a pound on oleomargarine that is colored in imitation of butter, and I desire to indorse that principle and ask for its enactment.

Q. (By Mr. FARQUHAR.) Is that intended to tax it out of existence?—A. It might have that effect.

Q. Is it a fact that in the manufacture of oleomargarine the farmer has added to his producing power by the fact that the bull can also make butter?—A. We are willing that oleomargarine shall be made and used, if it can be used for what it is.

Q. Are you aware that it goes all over the world and brings millions into this country?—A. Yes; but I do not understand that it increases its real value as an article of food, however, when it is colored to imitate butter.

Q. Do the creameries of this country use oleomargarine in their mixtures now?—A. I suppose there is some creamery butter in nearly all oleomargarine.

Q. Does your organization see a way to prevent these creameries from mixing oleomargarine with their butter and in that way avoiding the coloring?—A. I would be in favor of legislation that would require anything that is not made from pure, unadulterated milk and cream to be marked so that whoever buys and uses it will know what he is using.

Q. (By Mr. RATCHFORD.) Would the contention of your organization be satisfied by labeling this adulterated food, showing what it is, rather than by fixing the price of it by law?—A. We are not satisfied, because the person who eats it has no idea what label may have been upon it. The person that buys it and serves it in a hotel to 300 or 400 guests may know what he is buying, but he imposes upon his guests and practically says, "This is butter."

Q. Is the contention of the farmer for fixing prices by law for any given article—butter, for instance—more justifiable than the contention of the miner would be in endeavoring to fix a price for gas, oil, electricity, and other substitutes for coal?—A. We do not want to fix the price by law. My position is that any legislation that will require this oleomargarine to be sold and used with the knowledge that it is oleomargarine and is not butter is all right, but any law that does not accomplish that would not be right. I do not wish to be understood as stating the position of the National Grange, for I do not think it has taken action on this particular point; but I am speaking for myself and for the Grange and farmers of New Hampshire. I say we are not satisfied simply in having it marked, because it does not prevent it being served and used as pure butter. We have a law in our State, and this law is also in force in several other States, that any hotel or boarding house that serves oleomargarine, colored to imitate butter to its guests shall notify the guests of the fact that oleomargarine is served.

Q. (By Mr. CONGER.) Is that law effective?—A. Within a month I have made thirty-two prosecutions under that law and got an indictment in every case.

Q. How many convictions?—A. All of them. They all paid their fine.

Q. (By Mr. FARQUHAR.) What is the penalty?—A. The fine is \$25.

Q. (By Mr. A. L. HARRIS.) If you had that color law you desire would it save you from all prosecutions, because the instant the oleomargarine is put on the table the guests would know it?—A. They would see it was oleomargarine, and the person who bought it would buy it for a good deal less money than he pays now.

Q. (By Mr. CONGER.) Do you think it would be fair to prohibit the manufacturer of oleomargarine from coloring it yellow and not prohibit the manufacturer of butter from coloring his product yellow during the winter time when it frequently is not that color?—A. Yellow is the natural color of butter.

Q. At all times of the year?—A. At all times of the year, with the exception that in some instances the shade of yellow is not so deep as in others. Yellow is the natural color of butter, and it is not the natural color of oleomargarine.

Q. Is it the custom of butter makers in the winter time to color their butter, and should not that also be prohibited?—A. I will answer in the words which have just been used. The coloring of butter is to intensify the color of yellow in the butter, but not to add yellow. In oleomargarine the coloring does not intensify any color that previously existed, but it is for the purpose of having it appear something which it is not and to deceive the public.

Q. When oleomargarine or butterine is displayed for what it is, would you contend that the coloring is for the purpose of a fraud?—A. Not in the matter of the sale.

Q. What is the coloring for, when it is sold for just what it is?—A. It is done to conceal, to deceive the person who eats it; it is to make it take the place of something else; if it was not so it would not be done.

WASHINGTON, D. C., June 19, 1899.

TESTIMONY OF MR. JAMES BARRETT,

Farmer, Augusta, Ga.

The commission met at 11.55 a. m., Vice-Chairman Phillips presiding. Mr. James Barrett, vice-president Georgia State Agricultural Society, being duly sworn, testified. The topical plan of inquiry on agriculture was followed.

Q. (By Representative LIVINGSTON.) Will you please tell the commission the general condition of agriculture in your section?—A. So far as the condition of agriculture in the section of the State where I live is concerned, it is decidedly worse than it has ever been.

Q. Is the agricultural labor, or persons employed, increasing or decreasing in Georgia and the South?—A. Increasing.

Q. From what source does this increase come—class of people?—A. From the increase of births; very little immigration.

Q. Natural increase in population?—A. Natural increase in population.

Q. Please take the syllabus, step by step, and make your own statement in regard to it.

The WITNESS. The natural increase in the population in what we call the cotton States is about all we have, I think. I do not think the immigration to the South amounts to anything. The cause of that nonimmigration to the South is the cheapness of labor. The comparative condition of those engaged in agriculture I think is much worse than it has ever been. The chief product of the soil has been produced at a loss for 2 years, at unremunerative prices; that is, cotton.

"Transient labor in busy seasons"—the labor is becoming more transient; in other words, they shift from plantation to plantation.

"Hours of labor in different agricultural pursuits"—the hours of wage labor are about 9 hours to 9 hours and 20 minutes on the average through the year, taking winter and summer. The average number of days employed in the year for wage labor—all are workdays, except when the weather does not permit or sickness. Now, for day labor it is very irregular; I do not suppose it averages one-half of the year. The white labor of the State is drifting to the cities and seeking other employment; the negro labor, from necessity, is confined locally to the farm, as there is a disposition all over the South, I think a great deal, to exclude the negro from mechanical pursuits, just as I found in the State of Ohio when I was out there.

We pay daily, weekly, and monthly wages, but generally when we hire labor by the month on the farm, we pay only half, and the other at the termination of the period for which they are hired. We do not hire labor by the year; we hire it about 7 months, up to cotton-picking time, and then the cotton is picked by the pound, so much per hundred; it ranges from 30 to 40 cents, some as low as 25 cents; the average figure is about 50 to 60 cents per day. We pay for labor by the month; for the best, \$6 and what we call rations, which cost about 35 cents a week. In that we include his house and his garden or the privilege of keeping pigs, chickens, if he is a thrifty negro, or whatever he surrounds himself with. I have had no experience in white labor; in farming pursuits it has all been with colored labor.

Q. Do you mean to say the laborer does not have house, land, or anything of that kind?—A. Nothing of that kind. The wage laborer has a plot of land, therefore he can cultivate acres of land for himself, doing that on his holiday—I mean Saturday; he has generally half of every Saturday—and work it together with his wife and children. He pays nothing for his rent, his household, or the rations for himself, individually; he buys rations for his family. His wife and children do the preliminary picking of the cotton crop. The maximum wages, as I said, are \$6 per month and the minimum about \$2. Some farmers pay by orders on the store, dividing the profit with the storekeeper in some cases. I always pay the money.

Tenement houses are furnished with the rent of the land. Land in my section rents from \$1.25 to as high as \$5 an acre. It depends upon the location and quality of the land.

Q. Having said nothing at all about that class of labor, you would better explain that. What is the tenant?—A. The tenant is the one who runs the land for you, and is commonly called a cropper, owning his own mule, renting him on credit or out of his own pocket, usually—credit in the country store.

Q. What are the terms?—A. If he pays in cotton (I always think it fair to make it a money valuation myself), it runs from about 500 pounds for a one-mule farm to 1,000 pounds for a two-mule farm, and from 500 pounds to 1,000.

Q. That is rent?—A. That is rent. And the landlord has first lien on that rent.
Q. What privileges has that tenant?—A. House free, garden patches, and wood. And we have another system where they work on shares.

Q. Explain that.—A. The farmer furnishes the land, mule, and the feed of the mule, and the tenant's house; the tenant furnishes the labor, feeds himself, then divides the expenses of the blacksmith, or the repairs, and half the guano, and they divide the crop equally between them, share and share alike. The farmer puts his mule, the feed of the mule, and land against the labor and feed of the labor. Those are the systems pursued in our section of the country.

Q. (By Senator MALLORY.) You said that the rent of the land was from \$1.25 to \$5 an acre. Is that where you rent land without taking any of the product at all in compensation?—A. I take the money; it is money valuation, just like you rent a house for money.

Q. You value the land rented for \$1.25?—A. Yes; and he has nothing more to do with it. The land I get \$5 an acre for is worth \$100 an acre; about 5 per cent without the tax. The land we get \$1.25 for, which is located right close to the village, is worth about \$8 or \$10 an acre. That is the open land. Now the wooded land and the waste land, which is included in that valuation of \$10 in the aggregate, does not rent at all, except the tenant has the right to fuel off from it.

Q. The tenant, or cropper, as you call him, pays no rent at all?—A. The cropper pays no rent at all.

Q. (By Representative LIVINGSTON.) In making a statement please give the custom of the State and the country rather than a particular locality.—A. You are well aware of the Wild Grass section in Georgia. It is nearly all white labor, and they do their own work and own their own land. In north Georgia, in the mountains, the principal tenants are white labor; and that is the custom all over the State with the cropper—equal division. The tenant is a renter; but the cropper system is pursued in the mountains of Georgia, as well as in the Black Belt in Cherokee County; they pay the same way; divide the crop.

Q. "Loans to tenants, liens on growing or prospective crops; extent of; effect of."—A. That is the worst part of it. If you go into a country store, asking them to help you, the profit charged is not less than 50 per cent, and sometimes 100. To illustrate, they buy a bushel of corn for 50 cents, and they sell it on time for \$1; they pay 5 cents a pound for meat, and sell it at 10 cents a pound; and that average time is only 4 months, not 12. If you go to a cotton factor in Augusta or Savannah, or anywhere else, that is the system of loaning. The tenant, or one-horse farmer, goes to the cotton factor and says he wants \$100, and the cotton factor says, "Yes; you can get it at 8 per cent." But that does not tell the tale. He takes an obligation from that one-horse farmer that he will send him 10 bales of cotton and pay him a commission of \$1.50 a bale. Well, if the acts of the King's enemy or the acts of God should prevent him from making that 10 bales of cotton he has got to pay that \$15. He pays that whether he makes it or not. I do not believe it is legal payment, but if he does not pay it he does not get any more advances. When you count that up, it is about 23 per cent; that does not include insurance or transportation, or anything else. In the town where I live the rate on a bale of cotton is 15 cents a hundred, and 75 cents a bale for 30 miles, a pretty stiff rate.

Q. (By Senator MALLORY.) What town is that?—A. Waynesboro, near Augusta. To be accurate, it is just 32 miles, and it is 75 cents.

Q. How are these merchants who advance to croppers and farmers protected?—A. Generally by taking the landlord with them—a lien on the crop. Generally he sizes up what the crop will be.

Q. Suppose it is the landlord himself, do they not then make him give a lien?—A. When they make the landlord waive his lien, that is the same as the landlord giving the lien, because the tenant himself may make enough to pay it. The law in Georgia gives the landlord the first lien on all crops, and gives the second lien to the man who advances the supplies. Now, to make it doubly secure, he gets the landlord to waive his lien notes; then he has a lien for the supplies, and he has the whole thing.

Q. Do the landholders ever waive that lien without accepting rents?—A. Yes, very often without accepting rents, in our section.

Q. (By Representative LIVINGSTON.) You mean to say get nothing?—A. That they get nothing if the merchant sizes up what the negro can make, and he generally does. Now, I will give you another illustration of that. We will take the renter who rents right square out for the money. The landlord takes that note to one of our local county banks and asks that bank to discount it; he indorses the tenant's note. It is largely now the landowner who wants a little money. He goes into the bank: "Yes, we will do it for you, but we will take off 10 per cent." If it is \$100 they give you \$90 back, and the note is due the 1st of October,

which is 8 months, and if you multiply that by four you get the percentage that they charge there. I will tell you what is the cause of all this, in my humble opinion. It is the national-bank act outlawing real estate as a security. When the war ended we had nothing in the world left for security but land, and we had nothing to put up; and we were then plundered and pilfered as much as they pleased, to get something to support this large population thrown on us without a thing in the world, and it has been so ever since, and the remedy is to give land the dignity of security.

Q. You mean to say that you want the national banks to loan money on real estate as collateral?—A. Yes.

Q. And that the farmers have nothing but that?—A. Nothing but that.

Q. They are shut up to this system to get advances?—A. Yes.

Q. And otherwise they give loans on something they have not got?—A. I understand that. We are shut up to the lien system. It is a wrong system.

Q. And the man who furnishes guano or corn or flour must be secured in some way, so you have a system in Georgia of securing for advances by giving what they call crop liens?—A. Yes; crop liens.

Q. And those crop liens are made in what season of the year?—A. Those crop liens commence about the 1st of January and end about the 1st of September, when the cotton begins to be picked.

Q. You mean to say farmers are shut up to that system because robbed of the credit land ought to give them?—A. Yes; I do say that, positively; the land ought to be their credit.

Q. Is that the cause of the State banks in Georgia decreasing?—A. No; the State banks, before the war, increased; the land was the highest security we had, as it is in Europe to-day; lands are the highest security known there, but we are smarter financiers than the Europeans.

Q. (By Mr. PHILLIPS.) If lands had been put up as security in that early date, when there was comparatively no money—A. (Interrupting.) We had plenty of bank capital then; my town had three more at that time than now.

Q. The question is, would these lands have been private? Would they not have been sold for security, perhaps, and the condition have been worse?—A. No; I do not think so. In my county, Burke, the largest agricultural county in Georgia, we have scarcely a man there—I have lived there 29 years—who has a large farm who has not been taken up on an interest account and sold out and absorbed by the merchant. You can not legislate to protect fools. The more you let fools alone the better off you will be. Just let the farmer to-day be untrammelled. He wants no protection whatever, but wants no legislation against his interests. That is his idea about it. Give him reasonable transportation for his goods to the market, and reasonable rates of interest, and the cotton farmer can take care of himself.

Q. (By Representative LIVINGSTON.) If the farmer of the South could use his land as a credit, would it lower the rate of interest?—A. Yes.

Q. About how much?—A. I think it would be about the legal rate of interest in Georgia.

Q. About 7 per cent?—A. About 7 per cent. We were speaking of the rates of interest Wednesday. I have covered entirely this land association, the result of that Corbin Banking Company, and others; I do not specify them any more than any other. The rule is, if a man wanted \$10,000, he apparently got it at 8 per cent interest, but here comes in a big commission—20 per cent commission for indorsing that loan—and when he got the money actually in his hands he got \$7,000; so he paid 8 per cent on \$10,000 for 5 years, or as long as the loan lasted, and got \$7,000 in the beginning. The result was he was sold out.

Q. Did that system of loaning and borrowing money prevail for a long time in the South or not?—A. Almost universally.

Q. It does not now much?—A. Largely now. The store-keeping business is more dominant than it ever was.

Q. Explain why it was, instead of going to Augusta and Atlanta to borrow money on his real estate, a farmer had to go to the Boston Company, Corbin Banking Company, or some other company to get money.—A. Because the national-bank act outlawed his security.

Q. Is the landed property of the South the only property outlawed by the national-bank act?—A. I do not know of anything else, especially at this time. I think mules, or something of that sort—they would not take personalty.

Q. How about railroad bonds, State bonds, and county bonds?—A. Yes; mighty glad to get them; railroad stock, factory stock, or any other kind of stock that I know of. I think some of our national banks in Georgia have a very good recollection of the Central Railroad stocks.

Q. (By Senator MALLORY.) Does not real estate really hold substantial, stable value, better than many things accepted by national banks?—A. Yes, decidedly. Real estate really fluctuates less than anything I know of. I will give you an illustration: I have known of one factory stock that sold for \$10; to-day you can secure that factory stock at 65.

Q. (By Representative LIVINGSTON.) Do I understand you to say that the misfortunes of the planters of the South, and the laborers therefore connected with them, largely come out of this banking system?—A. I do think so; yes. I do not see any difference between a national bank and a State bank, except the difference in currency. I think that national banks have done more to injure agricultural interests of the South than any legislation ever enacted by the Federal Government.

Q. How about grading and classing the cotton; who has that to do?—A. The merchant classifies it, if the seller is ignorant, to suit himself. If the seller is intelligent, he generally classifies it correctly.

Q. You mean to say, then, in the first place, the farmer, the landlord, the tenant, the cropper, or the laborer, if they have any advances made to them, are all in the hands of the money lender?—A. Almost invariably, with a few exceptions. There are some men who are not.

Q. We are talking about the general rule.—A. Yes.

Q. To begin with, they are all in the hands of the money lender?—A. Yes.

Q. When the crops are raised they are all mortgaged?—A. Nine-tenths of them.

Q. It is delivered to the factor, or to the merchant, or whoever holds that lien, under that mortgage at a given date, as he gets it out?—A. They are all due, but he pays along when he gets it out.

Q. Due on the 1st of October?—A. Yes; 1st or 15th.

Q. Does not that have a tendency to depress the price of cotton?—A. No question, if you rush into a new market more than it can consume. If you run a crop of watermelons to New York it will depress the price. It is the same thing in cotton.

Q. You say, then, that the employer of labor is at a disadvantage in that all cotton of the South is due on the market at a given time?—A. Yes.

Q. And Liverpool has nothing to do with it, but seems to do it?—A. That is true; it has a tendency to depress prices.

Q. There is the whole crop of cotton of the entire South—six, eight, or ten millions of bales—put on the market in 10 or 15 days?—A. Yes.

Q. What is the usual answer when the merchant is asked to advance the price of cotton along about that time? Does he say he has plenty of money but no money to buy cotton?—A. They generally say they have plenty or, very often, no. I know one thing of my own knowledge; they did not have any money to pay for cotton, but they bought it, nevertheless, about the time it came along.

Q. Is cotton cheapest the 10th or 15th of October?—A. Generally lower than almost any time. I think last year or this year—crop of 1898 or 1899—averaged the farmer in our section a fraction over 4 cents on the farm.

Q. What, in your opinion, does cotton cost the farmer to raise it?—A. You can raise cotton at the present price at \$3 labor, but at \$6 labor it is a loss. It costs over 6 cents a pound to make it.

Q. You mean \$6 a month?—A. Six dollars a month; it takes to run a mule on a cotton plantation two and a half hands to the plow; in other words, five hands to two plows. You can not cut them in two, but that is the average. In other words, it would take two good hands and a half-grown child to make a crop for one mule.

Q. The mule does the plowing.—A. The mule does the plowing, the negro does the hoeing and picking; together their work will make a cotton crop in my section. That labor costs us \$6 a month, and rations \$2.50 for one plow, and it is a very good farmer, white or black, that will make 10 bales of cotton to the plow and gather it. At a fraction over 4 cents—a standard bale of cotton is 500 pounds—10 bales of cotton at \$20 a bale is \$200, and you have given \$250 on that for labor without anything else. That is the condition that we are in to-day. We do not count his interest account, nor the wear and tear of his mule. The general estimate of the wear and tear of a mule on a cotton farm is about \$25 a year; it may be a little exorbitant, but we will even put it at \$15. Generally, when he goes four years through the hands of the negro, it is pretty near to \$100 he costs.

Q. (By Mr. KENNEDY.) If that condition now confronts you will it not force you to raise other crops or try to make money in another way?—A. I have tried on cotton; I have diversified, and I have not made any money by diversification.

Q. (By Mr. FARQUHAR.) What is the character of your market?—A. I run a truck farm. I grow green peas and everything I know of. I have raised horses,

cows, and hogs, and I have diversified it for the last 3 years, and have not been able to make a dollar; but I have been able to keep my land from being mortgaged—that is, 1,500 acres.

Q. Is the Augusta price regulated at all by the prices of New York or elsewhere?—A. Liverpool controls the prices.

Q. I mean diversified products of the farm?—A. No; New York does not control that. It is generally the people at home. My experience is confined to cotton. The nearer you sell anything at home the better off you are. The closer you sell a bale of cotton to your gin house the better off you are. Then there is another thing that comes up that we farmers have to pay that we do not get anything for, and that is the bagging and ties; it is absolute loss. The average cost of bagging and ties in our section with merchants is about 85 cents; the absolute cost is about 60. The absolute tare of a cotton bale is 24½ pounds, according to the test of the mills in Augusta, and Mr. Alexander says he hopes to get it down to 24 pounds. The tare in Liverpool is 30 pounds, which is 6 pounds taken from us. Any process that will get rid of bagging and ties will be another great benefit to the farmer.

Q. (By Senator MALLORY.) Have you had any experience at all with this new method?—A. Round bale?

Q. Round bale, and also the small bale?—A. 24 by 54? That is the biggest humbug of all; that does not remedy the evil at all. Let us take that 24 by 54. You do not get rid of bagging, you do not get rid of tie, and you do not get rid of compressing. The ordinary bale of cotton has only a density of 12½ pounds, and the 24 by 54 has 22½ pounds.

Q. I think it is 12 by 36. I am not accurate on the size, but the density of the bale is 47 pounds. The tare on the Lowry bale is only 1 per cent.—A. The tare of the square bale—it is hullabaloo, this square bale of cotton—that, too, is compressed. Then another thing that farmers have to pay for is what is called country damage. God knows there is no country damage on a bale of cotton when it leaves the country ginhouse.

Q. How much is deducted for that?—A. We estimate, in Liverpool, \$500,000 for the entire crop.

Q. How about the round bales?—A. I am greatly in favor of the round bales, after investigating them, with one exception—it is dry, with everything tight. In other words, a man does not own his press; he only pays rent to use it, and guarantees, whether he uses it or not, to pay a royalty on it for 17 years, and for the patent arrangement \$100 for 17 years.

Q. (By Representative LIVINGSTON.) Will you explain what a round bale is?—A. There are two systems of round bales. One we call the batting system; it takes cotton as it comes out of the ginhouse from the condenser, comes up the batting form, and passes through two presses, iron rolls, and rolls the bale in that way. That is the American bale. The Lowry bale is fed into a hopper on top of slots that revolve around it, and passes over little slots and spokes, the spiral system, just like a screw. The packing is done by hydraulic press underneath, and as it passes through this spiral winding it straightens the fiber. The other bale injures the fiber.

Q. What is the standard weight?—A. The round bale is 250 pounds, and two of them make a standard bale; and they are covered.

Q. And by that you get rid of the ties?—A. That is bound by four wires. In this spiral-packed bale there is a hole, and you run a wire through the hole and around on the outside, and when you cut those wires it just opens like a screw—exactly like an old-fashioned wooden screw. There is no unwinding at all. The American bale has to be unwound to get out. The Lowry bale, in my humble judgment, is the best.

Q. What is the present cost of a bale, as ready for market?—A. The absolute cost is about 62 cents—the bagging and ties; ginning is \$1, and packing would come to \$1.

Q. (By Mr. FARQUHAR.) How is it with the Lowry and the other one?—A. The ginning and packing of the old Lowry bale is \$2; about \$2.20.

Q. (By Senator MALLORY.) Is there a saving in that over the other?—A. Oh, yes.

Q. The Lowry is half the size of the standard bale?—A. I am basing everything on the 500-pound standard bale. Two bales together cost 40 cents, which would be \$2.40, including bagging and ties. There is 50 cents each on the round bales, royalty; then the ginner gets his dollar; then the bagging and ties are 20 cents less than the gunny-bagging bale. It is 41 cents to compress a square bale, and the round bale is already compressed; that is the only saving. You do not lose

24 pounds tare at 6 cents, which would be \$1.44 a bale, and the amount charged for tare would end there. Then they can not pilfer the bale either. There is no 15-pound pilferage, as Mr. Hester puts it.

Q. Why, can they not steal it?—A. No; they can not do it. That is another advantage of the Lowry bale. You can not false pack or mix pack; the farmer can not play the rascal there.

Q. (By Mr. FARQUHAR.) That is, introduce foreign substances?—A. You can not do it. It will show at the inspection.

Q. You can do that with the American bale?—A. You can false pack the American square bale. The round bale—Lowry bale—saves 45 cents a hundred—0.0044 per cent.

Q. (By Senator MALLORY.) Is the Lowry an English patent?—A. It is by a Boston man—American; I think he is a naturalized Irishman.

Q. They rent the machine?—A. It costs \$1,000 to build the presses. They sell them to the farmer or ginner for \$500, and every bale has a tax on it of 50 cents or \$1 for a 500-pound bale. If that ginner does not use that press afterwards he is bound to pay \$100 royalty, whether he uses it or not, for 17 years, and there is the wrong part of it. The other one is worse still; I have not had time to read on it—the American bale; I have just hastily looked over it. There is one danger in the cotton baling, and that is another trust; another trust in Texas has had a great deal of trouble with the American bale. The Texas legislature has been legislating against it.

Q. (By Mr. FARQUHAR.) Is that trust created by patent?—A. Yes.

Q. That is the father of it?—A. The railroads are the "mammy and daddy" of trusts. They are like the hen that lays the egg without the rooster.

Q. (By Mr. KENNEDY.) One would gather from your testimony that the farmers through Georgia are in a pitiable condition, and yet it is generally considered that Georgia is a prosperous State.—A. Well, our tax returns last year show a decrease.

Q. According to your testimony you lose money making cotton. Do you make it up in any other way?—A. I told you how I settled in Burke County.

Q. What is it that makes Georgia a prosperous State?—A. Georgia is not a prosperous State. The tax returns have decreased in the last year or two, and the tax has increased, unfortunately.

Q. Do you make up for this loss in cotton with your peaches and watermelons?—A. The watermelon industry in Georgia has been absolutely destroyed by freights. No man can raise watermelons profitably in Georgia to-day. My county used to be one of the largest watermelon-growing counties.

Q. (By Senator MALLORY.) Does that apply to other products?—A. We can not ship products to New York from where I live. The railroads beat us out.

Q. (By Mr. FARQUHAR.) How many miles are you from Augusta?—A. About 32 miles.

Q. Is freight on that 32 miles equal to water transportation from Augusta to New York?—A. I do not think it is. I am not positive about it. It is 90 cents a bale on 500-pound bales of cotton.

Q. (By Senator MALLORY.) Thirty-two miles?—A. Yes. Now I will give you an illustration: On the Southern road, or South Carolina road, running from Augusta to Charleston, the freight on a bale of cotton to Langley Cotton Mills, 7 miles was 25 cents. Since the Southern road absorbed the South Carolina road they charge 9 cents per 100, 45 cents per bale, as against 25. There is one of your trusts; you say there are no trusts in railroads. While I am on this railroad question: I was talking with Mr. Scott of the Georgia Railroad in regard to the round bale. I said; "What are you going to do? What is the tonnage of the round bale?" "Well," he says, "I would be perfectly willing to reduce rates from competing points, but from noncompeting points I can not reduce rates. I can put in, with this round bale, 60,000 pounds of cotton, and, with the square bale, 20,000 pounds.

Q. (By Representative LIVINGSTON.) Into what?—A. Into a box car. That is Mr. Scott's own statement, no longer than Thursday afternoon.

Q. (By Mr. FARQUHAR.) Do you think the road you are speaking of now has enough tonnage to reduce rates? Do you know anything about the dividends of the road?—A. That is the question. The Louisville and Nashville road pays a rental of \$800,000, and it pays dividend earnings of 11 per cent to its owners. I think they could reduce it on that. To be just to the road, I want to state nothing but the truth. I do not want to do any concern an injustice. The road does not earn all the rental, but they have to pay nearly the equivalent to it in improvements and the rental.

Q. (By Senator MALLORY.) Since they bought it?—A. Since they leased it.

Q. Put on improvements, you say?—A. I think it is capitalized at something like \$7,000,000.

Q. You say improvements, do you mean by that, distinct from repairs?—A. Improved shops, improved depots, improved everything, improved rails.

Q. Do you know actually what that particular road is making now on the capitalization?—A. Well, they consider it in Augusta a good 7 per cent investment outside of the bank, and the bank makes a little over 1 per cent, making it a 7 per cent investment. They guarantee that stock when they lease it; they guarantee it at 11 per cent, 10 per cent, the bank making a little over 1 per cent.

Q. The railroad pays stockholders now 10 per cent?—A. Well, they do not make it; I think their deficit is about \$80,000 to \$100,000 a year.

Q. (By Representative LIVINGSTON.) Mr. Farquhar asked you if you thought they would lose if they reduced rates.—A. On the capitalization?

Q. You think the road loses \$100,000 to \$150,000 a year? If so, they are not in good shape to reduce rates?—A. If they can reduce from competing points they can reduce it from local points.

Q. That is not the question.—A. If they do it on the one hand, they ought to do it on the other. It is a 7 per cent road anyhow. The Louisville and Nashville road is using it simply to break down competition and it makes up what it loses in that competition.

Q. (By Mr. KENNEDY.) Can you state what is the cost of shipping a bale of cotton to Liverpool, and then the cost of getting a bale to the seaboard from your place?—A. I think from Augusta to Savannah it is \$1.30 a bale, or a little over.

Q. And then 3,000 miles to Liverpool, how much?—A. I think it is about one quarter of a penny a pound. It may be more than that. I would not be positive. It may be about \$2 or \$2.50 a bale, or one-quarter of a penny.

Q. Double the cost of getting it to Savannah?—A. Yes; but when you add my freight on to that, and then freight to Savannah, it is about equal to 90 cents, which, added to \$1.50, makes it about equal, laying 10 cents off.

Q. (By Representative LIVINGSTON.) Take up the question of immigration as it affects the farm. Is there anything of that down South?—A. We will never have immigration as long as the negro is there; in the Black Belt I mean.

Q. (By Senator MALLORY.) You stated that the cause for the absence of immigration is the cheapness of labor. Is that the only cause?—A. I think that is the real cause. Nobody but the negro and the Chinaman can live on what we pay the negro.

Q. Is there nothing in the social status of the field labor there; would the white man work alongside of the negro in the field?—A. That would not be necessary for white labor.

Q. I am speaking of black people?—A. Well, almost all labor is negro. The way we do in my country we work separately from the negro.

Q. (By Representative LIVINGSTON.) What inducement has the European labor to go South and work where the black negro is?—A. None whatever, for the simple fact that he can not live as cheaply, unless it is the Chinaman. You must recollect that the Italian or Chinaman can not do that work for less than the negro. Then they have not social relations.

Q. (By Senator MALLORY.) That is what I wanted to get at.—A. If they came in colonies they would have social relations, but if they come individually they do not.

Q. (By Mr. RATCHFORD.) Has the establishment of mills in Georgia brought any immigration there?—A. I think, without exception, a very few. The exception would absolutely prove the rule. It is all white Southern labor in our cotton mills; I know it is so around Augusta; we have no Canadian labor. I know they started a mill recently to make fine goods. All our labor was very awkward at it; they had to be taught; they are running them now; they are a great deal better. At one time it was agitated to bring Canadian labor and put it in that mill; they had to abandon it; they did not bring it; I do not know why.

Q. (By Mr. FARQUHAR.) Are they getting along without any new labor?—A. Yes.

Q. Have they had success down there in making fine fabrics?—A. No.

Q. It is an experiment?—A. Yes. It has been a failure so far; but the mill people are learning. They make no money and lose no money. They are swapping one dollar for a new one. I was talking with the president the other day; he said he saw his way clear to make money on the finer class of goods. Oh, there is no doubt about the people learning it here. If the Anglo-Saxon can learn it in England he can learn it in America. I do not see any distinction in the Anglo-Saxon.

Q. (By Mr. KENNEDY.) Is it not a rule, generally, that they are not Anglo-Saxons who work in these mills?—A. In Georgia they are all natives. We are getting rid of Northern superintendents very rapidly.

Q. (By Representative LIVINGSTON.) Are cotton factories making money down South?—A. Yes; they do, but they reduce wages.

Q. What advantage did the low price of cotton give the Southern manufacturer—difference between freights?—A. You see in a bale of cotton there is 75 pounds loss in the manufacture. They save that 75 pounds loss and the difference in freight, too. In other words, you take a bale of cotton and there is only 425 pounds of cotton in it, the 75 pounds is in the by-product, bagging, tare, seed, sand, and dirt. I think our labor is somewhat cheaper than theirs, and we work our labor in the mills in Georgia 11 hours and in New England they work 10.

Q. You have the additional advantage of light and longer hours?—A. Light and longer hours—4 per cent, you might say.

Q. Do they have any advantage in the waste; for instance, a bale of cotton of the same class of cotton spun in Augusta—do you know what the difference in loss is on account of the climate, and so on, outside of what you have already stated?—A. No; I think generally about 15 per cent on what they call 3-yard goods. On finer goods the loss is greater. In muslins they require more care in getting out the fiber. The whole secret in cotton manufacture is in the carding room, and all starts to be carded in the carding room first.

Q. What is the State of Georgia or the South doing to educate the agricultural labor—anything?—A. We have no textile school. We have a technical school. They are starting to build one in Augusta now.

Q. I asked you what you were doing to educate the agricultural labor?—A. They all have the same advantages, white and black, with the common-school system; and we spend several millions of dollars a year equally between the races. I do not think there is any distinction in the money question between the white and the black, except there is no mixture of schools like you said you had in Ohio, Mr. Harris.

Q. The schools are kept separate?—A. Yes.

Q. But the teachers and support are all paid from the common fund?—A. I think that the teachers and the expenses are all paid from the common fund. The negroes can have white teachers or they can have negro teachers; that is left to their predilections—their own choice.

Q. (By Mr. FARQUHAR.) Within the last 10 years, what has been the proportion of increase of your appropriations for schools and school facilities in the State of Georgia?—A. I think it has been nearly double.

Q. Are there complaints made of lack of facilities in your State?—A. No; I do not hear of any. Sometimes there is some little complaint that the school term is not long enough, but that arises largely from the poverty of the people being unable to stand any more taxation. I think the State of Georgia is bearing all the taxation on that line that it is possible for it to bear with the depressed condition of agriculture.

Q. Are the schools provided for by other than the general tax in your State?—A. General taxation.

Q. Are there special license fees or anything else that enters into the support of your schools?—A. The county tax and the State tax and the railroad appropriations; and there are some schools that have donations from outsiders, both negro and white schools. For instance, Atlanta College, and Lucy Haney Institute in my town. In Augusta they have, of course, that donation more than the white. Then we have another school that has been given a donation—Payne Institute. I think Mr. Payne, who founded that school, was from Missouri. That is a high school.

Q. What is the school age of children in Georgia?—A. I think they take them into the public schools at about 6; require them to be 6.

Q. Six to 18, is it?—A. Yes.

Q. What per cent of from 6 to 18 are enrolled? Do they go to school generally, or not?—A. I think in the cities they generally go; I think in the country they do not. I think the percentage—take the statistics of 1890—of illiteracy in Georgia was 16 per cent among the whites and 67 per cent among the negroes. Strange to say—I am ashamed to admit it before this commission—the census of 1890 showed my own city was the most illiterate in the United States.

Q. (By Senator MALLORY.) That includes the whites as well as the blacks?—A. That includes all. I have my opinion of the cause of it. I do not know as it is well for me to say.

Q. (By Mr. FARQUHAR.) What is your opinion as to the cause of it?—A. Well, I think it is too much politics in the schools.

Q. What is your town?—A. Augusta. I think politics is about as bad a thing for education as railroads are for fostering the trusts.

Q. (By Representative LIVINGSTON.) What remedies would you suggest to the commission to be incorporated into law by the States or by the General Government to better the condition of the farmers and laborers of the South?—A. The first is to abolish the outlawing of realty. Let realty be a good collateral security. The second is Governmental ownership of railroads.

Q. Anything else?—A. Have the Government let national banks run their own affairs instead of protecting them by taxing other people for issuing notes and circulation. Let the national banks hew to the line and take care of themselves.

Q. (By Mr. FARQUHAR.) Do you not think that there is another large question that concerns the whole agricultural world—taxation?—A. Yes.

Q. Do you not think that enters in more than some of these questions you have mentioned?—A. How are you going to help taxation with a deficit? Taxation is government in its last analysis.

Q. Has it not been the complaint of the Georgia farmer that he is taxed more than the manufacturer and owner of personal property?—A. Yes.

Q. Will you give the commission your views on this taxation that rests on the farmer, on his agricultural lands, and his personal property?—A. On the first proposition, how are you going to reduce taxation—the first proposition our Supreme Court sat down upon; thought they were wiser than Moses. Moses put on an income tax. An income tax is the fairest and most just and equitable tax that can be levied. If one has an income he is able to pay it, and if he has not an income he does not have to pay it. Under Moses's law, if he did not make 10 bushels of corn he need not pay 1 bushel.

Q. You do not seem to catch my meaning. Does the Georgia farmer bear a disproportionate rate of taxation, compared to other classes in Georgia?—A. Yes, and Ohio the same way, if you want that down. Mr. Chase said that it had been puzzling statesmen for thousands of years how to tax capital, and you have no solution of it yet, and he did not, either.

Q. Providing it came to this commission to find a remedy and introduce the remedy into the State of Georgia, in respect to the taxation of agricultural lands, what in your opinion ought it to be?—A. An income tax in the State.

Q. (By Representative LIVINGSTON.) Mr. Farquhar asked you this plain question, If the real estate of Georgia is not made to bear the great burden of taxation?—A. Yes, it is.

Q. Your idea is that notes and accounts pay no taxes?—A. Nor gold watches.

Q. And that bonds and stocks are hid out more or less, and all those things are hid out. Does the money that handles the entire cotton trade of Georgia pay any taxes?—A. No, it does not.

Q. Do you know what the number of tons is?—A. I think it is nearly a million; I am not positive, but I have some recollection that that is about the amount.

Q. Can you give the commission any information as to how that comes into Georgia and then gets out?—A. The notes do not pay. They take the notes in Georgia and sell them out into another State. That is the way they hide it out. The notes are taken after the tax return; that is the way.

Q. And they are disposed of before the collection day comes along?—A. Taken after the 1st of April.

Q. Come in between?—A. Come in along after the tax returns and tax collections.

Q. Is there not a great deal of other business done there the same way?—A. Lots of it. The solution of that is, that if a note or an account has not the stamp of the tax collector on it that the tax has been paid on it, that it can not be sued on in a court of justice.

Q. The money that handles the cotton in Georgia begins to come in and move it out at what time?—A. About the 1st of September; if it is an early crop, about the last of August.

Q. When is the cotton all sold and gone?—A. They commence collecting their notes in November, as a general thing, and get through then. The tax collector comes in the 1st of March.

Q. The 1st of March all the money and notes have gone out?—A. I do not think the State of Georgia gets a single cent of tax on cotton notes.

Q. (By Mr. FARQUHAR.) Or cotton money?—A. Or cotton money, either, and I do not think it gets any money on any other kind of notes scarcely, or very little.

Q. (By Mr. RATCHFORD.) The witness has stated that the farmer of Ohio and Georgia in particular bears the burden of taxation.—A. Yes, I do.

Q. Do you know whether there is any other State in which that is not equally true, or nearly so?—A. That is true. If you take the broad proposition, I will quote your statesman, Mr. Chase, that labor pays all the taxes.

Q. Labor pays all the taxes, but the question at issue now is whether the farmer pays more.—A. The source of wealth is land and soil, and if Adam Smith is right in his political economy, all wealth is what is taken out of the country in one year.

Q. Is the farmer paying more taxes, in proportion to his ownership of this wealth, than the mechanic, the miner who owns a little home?—A. No, I do not think they pay any more than the mechanic or the miner.

Q. You do not believe they pay more in proportion?—A. But they pay a great deal more than the capitalist.

Q. That, perhaps, is generally true in all the States.—A. All the States. They do not pay any more than the miner or anything more than the cotton planter or anybody else that owns a home.

Q. (By Representative LIVINGSTON.) Then, to better the condition of the Southern people, the farmer and the laborer, you would recommend that this commission suggest to the legislatures the equalization of taxation?—A. The equalization of taxation.

Q. On all values?—A. On full values and outlawed notes that have not paid the taxes.

Q. And then you recommend that the national banking act be so amended that a man can borrow money on his real property as well as his factory stock?—A. Let the owners of property be capable of creating a debt on it, and break up all this collection of debts; take all the trammels off the property possible.

Q. Any other recommendations that you have to make that would better the condition of things down there?—A. I have no prejudice against railroads, none in the world—railroads with legitimate competition; I would like to see more of them; but combinations that prevent legitimate competition I am opposed to.

Q. Does not the State of Georgia tax railroads, every line, every wire, and every pole?—A. You never had a tax on railroads until you had the Toombs constitution. They are taxed now, but not at their value.

Q. Are they not taxable in any county in which they go?—A. Yes, that is the Glenn law.

Q. The Georgia Railroad pays no taxes to the State.—A. That was their charter. They are paying their chartered rates, but under the constitution we can not tax them.

Q. But outside of that all railroads are taxed.—A. Up to that, none of them paid. General Toombs made that so they had to pay. I have not any prejudice against legitimate competition, but I must say I have very considerable prejudice against any combine that means to take advantage of the people.

Q. You make a distinction between a corporation and a combine, do you?—A. Yes; a corporation is different.

Q. What is the difference?—A. A corporation operated singly is not so objectionable, but when they combine together to operate together they are very objectionable.

Q. When you speak of railroad combinations, you mean corporations coming together to destroy competition?—A. Those two parallel lines, the South Carolina and Georgia and the Charlotte and Columbia, I think.

Q. Can that be done in Georgia under our constitution?—A. It is like Mr. Lockwood said about the Pennsylvania Central—they do it. Did not the Central Railroad lease the Georgia Railroad, paralleling lines?

Q. The constitution of Georgia prohibits it.—A. The executive officers of the State did not enforce the law, and you know who the executive officers were. The Georgia road is controlled by a noncompeting line; gone out of the hands of the Central.

Q. (By Mr. FARQUHAR.) Have you any suggestions to make of a remedy in the matter of these store and crop liens? Does any other way seem to promise a better outcome both for the owner of the land and for the crop owner?—A. I never did believe you could give a mortgage on something you did not have, and that is the rottenness of crop liens. That is why I am anxious and hope to live to see the day that the national banking law will be repealed—outlawing real estate as a security. Then we will not have any liens. The abolishment of the State crop liens that we had several years ago—one in South Carolina—also greatly benefited the farmers. Then they took the lien from the very beginning; now the law says they can take it if the crop is planted. There ought not to be any lien at all; it ought to be wiped out.

Q. Does the lien down there keep the land owner and the cropper in debt continuously?—A. If he waives his right, it does continuously.

Q. Is it a cause of poverty down there?—A. Yes; it is very dangerous. Thirty years ago, when I moved to Burke County, I served as deputy clerk of the court of that county. That was immediately after the war; there were hardly any mortgages, but considerable crop liens; and it went on until the State instituted

this present system. Then there were a good many prosperous negro farmers and a good many prosperous white farmers, but this system of high percentage and mortgaging their crops has absolutely wiped them all out in Burke County—almost without exception.

Q. (By Senator MALLORY.) Can you state the relative area of land devoted to the cultivation of cotton and that devoted to the cultivation of corn and other grain?—A. I know what it is in the South—all the Southern States—about the cotton area, but I do not know whether I could specify accurately for Georgia without looking at the year book. The general rule is to plant about 20 acres of cotton in our county, and 15 of corn, and 5 of other crops. That is about the proportion.

Q. Are the conditions you speak of with reference to cotton also the same with reference to corn and other grains?—A. Corn on the farm in our State is hardly a commercial article.

Q. It is used at home?—A. It is used at home. If you go to a man to borrow any money on that corn, he will say, "Get out of here; I do not want any."

Q. I mean with reference to the sharing of the crop?—A. In working on shares, we take half the grain and half the corn—share and share alike. We generally do not divide the potatoes; we generally let the share cropper have his potatoes; do not bother with them; some take them, but I never did—sweet potatoes.

Q. (By Representative LIVINGSTON.) Have the prices of land gone up or down in the last year?—A. I think it has gone down. Values have decreased.

Q. Is not the standard of the price of land the standard of the price of cotton? Is not that the old rule?—A. I think that is the rule; yes.

Q. As cotton advances land advances?—A. As cotton goes down land goes down. There has been a gradual decline; that has been about the difference; it is gradually going down, down, down. To give you an illustration, I know a plantation for which, 30 years ago, I would have been willing to give \$10 an acre I can buy it to-day for \$3.

Q. That is not owing to their decrease in production?—A. It is owing to the decrease in price. It is just like a stock that does not pay any profit; it is not worth anything; the land does not pay any profit; it does not amount to anything. Take Mr. Harris's State; that land, I think, when I investigated it—this was in 1880—was worth \$47.50 an acre; that year our lands in Georgia were only worth \$2.50 per acre.

Q. (By Mr. A. L. HARRIS.) As a rule, is not the value of the land measured by the production of the farms?—A. That is true; the price of land is regulated just the same as the price of factory stock.

Q. You can raise stock in Georgia?—A. Yes; I can raise a horse there as cheaply as I can raise a cow.

Q. You can raise a mule in Georgia?—A. Yes; just as cheaply as I can raise a cow; and I do it, and have been doing it for 30 years.

Q. You can raise hogs?—A. Just as well as you can in Ohio.

Q. You can raise wheat?—A. No. I think wheat is a very poor crop.

Q. How much is a horse worth?—A. The lowest one I sold was \$60 and the highest one I ever sold was \$200.

Q. I see the average value of your Georgia horses is higher than in Ohio.—A. Maybe they are better.

Q. How much is a mule worth?—A. An average mule will bring from \$100 to \$125.

Q. Is there a profit on a mule?—A. I think a mule can be raised cheaper than a horse, and they stand more rough usage.

Q. You can raise cattle?—A. Yes.

Q. You can raise some sheep?—A. I do not know whether my people could be converted to it. They can raise cattle cheaper than you can in the West. We have a by-product that we used to throw away that is a great deal more valuable for feed; that is cotton-seed meal from the cotton seed hulls.

Q. Can you not raise stock cheaper, really, there than you could in Ohio on account of our long winters?—A. Yes.

Q. (By Mr. FARQUHAR.) That makes a saving in the winter feed?—A. Yes.

Q. (By Mr. A. L. HARRIS.) You do raise a large amount of stock in Georgia?—A. Yes, we do in some sections, a very large amount, and we raise a good many hogs.

Q. Now, the query in my mind was in regard to your agricultural condition, when the very crops and stock that we grow in Ohio are valued higher, really, in Georgia than in Ohio, and we are in a prosperous condition, and why you are in this unprosperous condition? That is something that I can not understand.—A. I think the great cause is this outlawing of our land by the banks, and leaving us absolutely stripped of any collateral security at the end of the war, which did

not leave you stripped of any; and again, we have not the four millions of pensions poured into our State every year—that is another reason; and I do not think that the South will ever be prosperous under black labor.

Q. Does all of your paper go through the banks?—A. Oh, no; it goes to the curbstone broker, mostly.

Q. Can you not under your law establish local banks? Does your law forbid it?—A. No.

Q. I am speaking of banks of deposit.—A. Deposit and exchange; we can establish those.

Q. Do you have those in your county?—A. Yes; we have two, and they are the ones that charge about 40 per cent interest.

Q. Does the law forbid organizing more?—A. No; you can have as many as you please.

Q. If it is oppressive will they not organize more?—A. Before they put this other one there, the interest was really 50 per cent, but they have reduced it down now to about 40.

Q. What I was trying to get at was how the national-banking system was such a heavy load on you when you can organize banks of deposit and exchange that will do all the business that the national banks will do, except issue?—A. Very often these little State banks exhaust their capital and they have to go to the North to their correspondents, which are generally national banks in New York, to borrow money, and they have to put up this collateral security, and when they put the land in there, they do not want it. That is the matter. They can not rediscount such paper as that at the North, even with the indorsements.

Q. Do you not think that diversification of agricultural industry would be a great relief to your State?—A. Yes.

Q. How long have you been at it?—A. I have been at it 5 years now, in that diversified industry.

Q. You are beginning to sell the crops you have raised?—A. I sell horses, cows, hogs, Irish potatoes, sweet potatoes, cabbages, carrots, turnips, beets, and everything else, and raise rice, too.

Q. Can Georgia to-day raise cotton as cheaply as Texas?—A. Yes; with hired labor she can raise it just as cheaply as Texas, but she can not compete with the white labor of Texas with her labor.

Q. Is her soil as productive as Texas's soil?—A. No.

Q. Is it raised with white labor?—A. No; I was in Texas. I went out to look after that. I went right to the Brazos River, where the soil is as deep as this room, and I asked a cousin of mine what that land could make, and he said: "I have made as high as 3 bales to the acre on it." "How much corn?" He said: "75 bushels." I said to him, "Cousin Jim, that is not what I want to get at. How much do you average in 5 years? That is the way to test crops. One experiment does not always prove the experiment." And he said: "I average about three-quarters of a bale, and I average about 25 bushels of corn to the acre." Now, I said: "Jim, what do you pay your labor?" We were paying then, in Georgia, \$10. He said: "We pay \$18 dollars a month for labor." I said: "What do you pay for picking?" "We pay \$1 a hundred." We paid 50 cents. I say that with hired labor I do not believe Texas can raise cotton any cheaper than we can in Georgia; and no one can make money at the higher labor.

Q. (By Representative LIVINGSTON.) In addition to that, they do not use guano in Texas and we do. Now, what does that fertilizer cost in Georgia to the acre?—A. About \$2.25, but does not the difference in the price of labor make up for that? Is not their labor higher than ours, and does not that make a difference? We were getting about 12 cents a pound at that time, and then the difference in the labor of Texas and Georgia. Then here is another condition: we do not have the disasters in Georgia as generally as they do in Texas. Our crops are more certain. This last year and the year before that Texas had a good many disasters. The bulk of the cotton of Texas is made by white labor.

Q. (By Mr. A. L. HARRIS.) Does supply and demand have any effect upon the price of cotton?—A. I am one of the fools who do not believe in the law of supply and demand. I know some people who believe in it, but I say I am one of the fools who do not. I do not believe that God Almighty ever made a mistake, and he never made too much for any people if they were all employed.

Q. What is the production of cotton in the United States?—A. We do not know what this year's is going to be; last year's crop was eleven million two hundred and some thousand bales.

Q. What is the production of the world?—A. Now, that is a question. There is a great deal of doubt about what is the production in China. I have heard that the Chinese crop was estimated as high as 12,000,000 bales.

Q. What is the demand in bales per year?—A. I never paid much attention to

this eastern crop, because the American crop is gradually putting that out in the European market, and even sweeping the Chinese cotton out of its own market. Mr. Alexander's statement on that is simply that the fiber of the Chinese cotton is not strong enough to stand the spinning machinery; it would stand the old spinning wheel and the old loom, but it will not stand the modern spinning machinery.

Q. What is the consumption of cotton in the United States?—A. Something over 3,000,000 bales. The South consumed about 1,200,000 bales, I think.

Q. What is the consumption of cotton in the world?—A. I do not know exactly. We never could get at China with her 400,000,000 people.

Q. In other words, what has become of the difference between the 11,000,000 bales and the amount of the whole production? Where does that go to?—A. It goes into the equilibrium of the difference in production. A short crop this year and a long crop next year fills in the hole, just like your wheat crop. It goes abroad and here too.

Q. Do you not think now when we raise wheat at the North and you raise cotton at the South that we are raising too much?—A. No; I do not. I do not think you ever raised a bushel too much or we a pound too much. Do you think the Almighty ever made a mistake?

Q. (By Mr. FARQUHAR.) The Almighty is not before the commission?—A. Oh, I know that.

Q. (By Mr. A. L. HARRIS.) As long as there is a large crop do you not expect to take a smaller price for it?—A. No; I will quote Mr. Chase again, "It is the money that fluctuates, especially the paper money."

Q. When there is a failure of the crop in some other part of the world, then do you not expect a higher price?—A. The biggest crop we ever had, the crop of 1890, brought us the most money. That was the largest crop and it brought us more money than we ever did make.

Q. I am speaking of the production of the world.—A. I must be candid with you, I am not familiar with the production of the world because we can not get at it, and nobody else knows what China makes. If China did not make any cotton we would not begin to make enough cotton to do China, because the people of China wear cotton goods almost entirely.

Q. What effect, in your opinion, has gambling in cotton upon the prices of cotton?—A. I do not think it amounts to a hill of beans.

Q. And operating in stocks?—A. The only thing that can put up prices and put them down is the combine. I think this war on the bucket shops is all nonsense.

Q. (By Representative LIVINGSTON.) The State of Georgia makes a little over 1,000,000 bales of cotton; she sells that at 5 cents; that is a certain amount of money that comes to the credit of the farmers of Georgia for that cotton crop?—A. Yes.

Q. Now, if that cotton were put through the cotton press and manufactured inside the limits of Georgia, if you take that 1,000,000 bales and put it in Savannah manufactured, what would it sell for manufactured? I am not talking about labor and freights, or anything.—A. I think it would bring at least 50 per cent more.

Q. A bale of cotton weighing 500 pounds sold in its raw condition in Savannah at 4 cents would bring \$20; now suppose you stop that in Augusta and put it into cloth, and then sell the cloth; what would it bring?—A. It would bring about \$15 a bale more, at a rough calculation; nearly double.

Q. Now is not that one of the great losses of the South?—A. Oh, yes; where we can convert our raw material the profit is a very great thing.

Q. Is it not true that the man who sells raw material in this country or anywhere, that the profits are made from the manufacture instead of out of that raw material?—A. Yes.

Q. Now, if we should manufacture our cotton, would that help us?—A. It would help us enormously if we could convert the cotton into manufactured goods. That is self-evident.

Q. Can you take the labor of the South and diversify successfully? Can they use the improved implements and can they attend to the shipping, and are they adapted for that kind of general work that would be necessary in diversified agriculture—the negroes?—A. No; they can not use them except to break them up. We have tried the sulky plows. I have seen all kinds of farming all over the State and I am quite an amateur trucker, and I have never seen a good negro farmer nor a good negro farm in my life, if he is left alone entirely to himself, and I would travel to see one; I would like to travel to see him, like I did once to see Elliott when he presided over the South Carolina legislature. I heard

that he was a smart man, and I went to see if he was. I never knew of a good negro farmer.

Q. You do not mean to say that the negro is not a good cotton laborer?—A. I say left to himself he is not.

Q. He is a good cotton laborer?—A. He is a good cotton laborer under the direction of a white man.

Q. Would not that man be a good stock raiser or a good truck raiser?—A. No; I do not believe he would.

Q. Why not?—A. In the first place he is naturally brutal, and in the second place he will not water stock unless you keep right after him, and water is as necessary to stock as corn, and I believe in Georgia to-day there are more cattle that die from want of water than from want of corn and fodder.

Q. (By Mr. A. L. HARRIS.) I want to get back to this mule question.—A. I do not believe you can beat us on mule raising. We have good pasturage, and Mr. Wing, who is from your State, and by the by a very competent man, I think the most competent they have at the experiment station, contends that we have better milk and butter South than Ohio.

Q. Do you raise all the mules in Georgia that you use?—A. No. I am raising mules and also hogs. The hog and the negro go together.

Q. Where do your mules come from?—A. Mostly from Kentucky and Tennessee; some from Indiana and some from Missouri.

Q. Ohio sends a good many down South; I do not know where they go to?—A. We buy nearly all of our stock in Georgia from the St. Louis market.

Q. Is not your country well adapted to the promotion of dairy industries?—A. Quoting Mr. Wing—as I said, I do not know anybody more competent than I have ever come in contact with, more thorough and more reliable; I am glad to pay tribute to him—he says that there is no country he has ever been in that is superior to Georgia for cows, milk, and butter. He says that 9 months in the year we have pasturage, and that this Bermuda grass is equal to any grass he has ever seen in Ohio or anywhere else for dairy purposes.

WASHINGTON, D. C., June 20, 1899.

TESTIMONY OF MR. J. POPE BROWN,

President of the Georgia State Agricultural Society.

The commission met at 11 a. m., Vice-Chairman Phillips presiding. Mr. Phillips introduced Mr. J. Pope Brown, president of the Georgia State Agricultural Society, Hawkinsville, Ga., who, being first duly sworn, testified as follows (the topical plan of inquiry on agriculture being followed):

Q. (By Representative LIVINGSTON.) I will say that Mr. Brown is president of the Georgia State Agricultural Society. His home is in Hawkinsville, Ga., which is in the southwestern part of the State. Mr. Brown is a planter and nothing but a planter and has no other interests.

The WITNESS: None other, sir.

Q. What is the condition of agriculture in the South, especially in Georgia, where you are better acquainted?—A. Well, I do not think it is prosperous.

Q. Has there been an increase or decrease in number employed in agricultural labor in the South during the past 35 years?—A. I think there is more labor employed now in agriculture than there was then.

Q. You mean to say there is a regular, constant increase in agricultural labor in the South?—A. It seems to be so.

Q. What source does that come from?—A. That comes from the increased population. Some people are of the opinion that negroes—our main labor, especially in our section of the South—are not increasing, but I think that is a very great mistake.

Q. Statistics of the State show the contrary.—A. Show that they are increasing; but I do not think statistics get them all. I think there are more than statistics show.

Q. There has been no increase to amount to anything from outside sources in the way of immigration—Italians, or Chinese, or Japanese, or Irish, or any other source, has there?—A. No.

Q. They do not go South?—A. No; they do not come South; they do not come in our section.

Q. What is the condition of the labor?—A. A few days ago, while I was in the city of Atlanta, I was talking with a newspaper man, and I remarked that there were more people to-day in Georgia barefooted, hungry, and begging than I had seen since the war.

Q. You mean to say that they have not so many of the comforts and less of the luxuries of life and absolute necessities of life?—A. That is my observation.

Q. Will you state the condition of the landholders, those who employ labor?—A. I think the landholders have lost ground very materially in the last few years, and I think we are in a more precarious condition than the public generally understands, from the fact that now and then a certain individual that we have all thought was doing well and out of debt, getting along smoothly, has almost been compelled to succumb to the depression of the last two or three years. I heard no longer than a day or two ago of a gentleman who farms on an extensive scale; everybody thought he was doing well; he made the remark that he was doing well to pay the interest on what he owed.

Q. Which class of farmers are doing better, the extensive or the small farmers?—A. The small farmer is doing better, especially the small farmer who does his own work, and makes something to eat at home and stays at home and eats it. They are the only people that are able to stand the pressure, and they do not have many luxuries. They have the necessities which they can raise at home, which is their only salvation, but when it comes to carpets on the floor, organs, pianos, and carriages for the people to ride in, they do not have them.

Q. You think the financial salvation of those small farmers by this time is largely dependent upon the simple fact that they have cultivated the soil with their own hands; that is, the husband, wife, and children have done the farming?—A. Yes.

Q. And steered clear of hired labor of any kind?—A. Yes. I have right in my neighborhood an old negro who bought a piece of land 15 years ago, and he paid for it very promptly; he bought 250 acres. He told me just the other day that he was afraid he was going to lose it. I know a good many cases like that. He bought and paid for it with his own labor.

Q. Recognizing the fact that the South was once the most prosperous agricultural section in the world, what has led up to this condition, both of the landholder and the labor?—A. That has been a question that has given a great deal of concern to the best thought of the country, and I have given it a great deal of thought myself, but I have never been able to answer it to my own mind satisfactorily.

Q. There may be a varied lot of causes. You can cover them all.—A. If you will allow me just a little latitude, I may say that away back 15 years ago, during Mr. Grady's lifetime, the question was discussed by the editor of the Atlanta Constitution. He asked General Gordon to call an interstate convention of the farmers of the Southern States. General Gordon called that convention to inquire into the depression of agriculture, and the cause for it and the remedy for it; and I recall that Mr. Grady made a speech on that occasion in which he stated that it was not the soil nor the climate. Well, that gave something to think about; and right on that line there was a gentleman from Mississippi that made a speech. The tariff then was considered a great "bugaboo," and he made a great speech on the tariff. We had had a great deal to say about the tariff; that was the cause of a great many of our ills. He went on to say there was not any tariff on Western bacon; was not any tariff on Western tools, no tariff on hoe handles nor plow stocks, and that we were buying away from home, and ought to be making at home. There was no tariff on what we bought from the West, and we ought to be making that at home; nor on the corn, and a great many things he mentioned that we were buying. When he got through I thought maybe the tariff was not such a great big trouble for the farmer; that it was not in the soil or climate, as Mr. Grady said, and then if it was not in the soil and climate, and this old gentleman had kind of knocked the tariff "bugaboo" in the head—what was it? While the tariff might be too high, I do not think that alone, or in itself, has cut any great figure in the depression of agriculture in our country. One of the greatest troubles has been in the methods which we have pursued as farmers, and in the plan which we adopted in the beginning, of all cotton. That was by necessity, almost. You can not go into all of that. We were poor, had nothing to go on, had no collateral, and we just had to plant the crop that would bring money right away. We did not have time to wait.

Q. And one that the banks and everybody else would take?—A. Yes. For instance, if a man went into a supply store and wanted to buy mules, fertilizer, and provisions, the merchant said to him right away, "How much cotton are you going to plant?" and he got a mortgage on the cotton crop. They do not con-

sider a mortgage on the mules, and they do not consider a mortgage on the land worth anything; nothing was worth anything except cotton. Therefore they were forced in the beginning to plant cotton, and it was a long time before they could get out of it. They thought it was an easy way to make a good living. When the fellow would come up at the end of the year with 6 short bales of cotton and a mule, the cotton farmer would say to him, "Why did you not make more cotton? Here is a man that got 10 bales." He went back home and put in to make 10 bales, and at the end of the year he had 10 bales, and when he came up to the farmer the latter said, "Why did you not make more? Here is a man that made 12 bales, and here is another fellow who made 15 bales." He went back and tried to beat that, and then "the most unkindest cut of all" was when they told him, "You fool, you have made too much; you have overdone the thing." And he was doing what they told him to do all the time. We got in that fix and we did not know what to do. I was one of those fellows. I made as much cotton to the mule, I reckon, as any man in Georgia, and I went on the idea if a man could make two bales of cotton where one grew before he was a benefactor—changed cotton to grass. I discovered after a while it did not seem to be working that way; it seemed we made too much of it. The trouble about it was we started out making it at 20 cents, and then it went to 15, and then to 10, and when we learned how to make it at 10 it went to 8, and when we thought we had learned to make it at 8 it went to 6, and when we had learned how to make it at 6 it went to 4. The people of Georgia would not be planting it except they hope to get a better price for it than the now prevailing market. I will say right on that line that you can not buy a cotton crop to-day from the farmers of Georgia for 7 cents a pound, although they see quotations here on the market. They have a lingering hope that it may be 8 cents, and some of them think it may be 10. No, sir; you can not buy it for 7 cents a pound. They have that idea; they hope that it will be better; that they will get a better price it. Having gotten in that rut of planting cotton, and depending upon the cotton for money, it is very hard on all of us.

Q. If a man diversified from cotton into any other agricultural product or products, must he have 12 months' absolute cash to start it?—A. Yes; he must; independent of this advance to him. A few years ago, when cotton went down pretty low, we had a few instances of men stating, "Now we will quit cotton." Well, at the end of the year they were probably fixed for it. They had corn, potatoes, and everything to eat that they wanted at home and a good many of these things to sell, but there was no market, no market.

Q. And they would not take them on debts?—A. No; we can not sell corn and wheat and oats and pork in competition with the West. Our country is not particularly adapted to wheat nor to stock raising nor the production of food crops, and, in my opinion, it is a place only where diversified agriculture will succeed; you have got to diversify it. We must make something of all these things. I was one of those who run a good deal on cotton. I have been trying to get out of it for several years, and this year I have not bought a pound of meat for my whole plantation; I have not bought a bushel of corn; in other words, I have sold corn myself, and sirup and potatoes and hay, and I just thrashed out enough of wheat to last us a year; I think we will have flour enough. A great many other people are trying to get on that same line; people are trying to do it, trying to get there, but it is a hard matter for them to get rid of cotton to a great extent.

Q. If they go out of cotton, must they have something to live on during the year, while the experiment is being made?—A. Yes.

Q. Will the merchants or banks, or anybody else, advance them equipment for 12 months, to make that experiment?—A. I should not think so.

Q. Can they put the land in?—A. Land is not negotiable.

Q. Land is not negotiable under the national-bank act?—A. They can not use land to borrow money to make that experiment with. There is one way they can use it—go to one of the land associations; they will loan money at 7 or 8 per cent.

Q. That puts them in for 5 years, does it not?—A. Yes.

Q. And the interest amounts to 15 or 20 per cent?—A. Something in that neighborhood.

Q. How about the labor? Is it all drilled and skilled in the line of cotton?—A. I was going to say, right on that line, I think another cause of trouble with us is the fact that our system of education in the South has been radically wrong for a number of years.

Q. You mean common-school education?—A. Common-school and college education. The whole thing has been that a white boy was given an education upon the idea that when educated he would not have to work. We ought to have had

that education which would teach him to work after he got his education, and we have not had it.

Q. You think our common schools and colleges and high schools ought to teach industrial education?—A. Industrial education. We ought to have had industrial training in our common schools and in our colleges.

Q. Is there any other education practicable to that laboring class we have there except industrial education?—A. I do not think there is, there, that will amount to much.

Q. Is there anything open to them?—A. Nothing at all.

Q. Mercantile interests, railroading, nothing at all?—A. No. I think one of the causes of the depression in agriculture in the South is the presence of the negro. The negro does not know how to use improved implements, and does not want to know how, and it is almost impossible to teach him. If a man farming cotton on an extensive scale puts an improved implement in use, every dinky says it is impossible to use it, and they do not. They enter very largely into the agricultural conditions of the South; the people rent to them, and work on shares with them. They are averse to making anything in the world except cotton. They do not want to make corn. They love watermelons better than any people or any nation on earth, and they do not know how to make watermelons. They do not care anything about knowing how, but they do love them. There is no man in the State that lives under pleasanter relations with the negro than I do, and I work a good many of them. A few years ago I had 6 or 7 white men employed, and I cut down to 3, and this last year I cut down every one I had, because I could not pay them. At the present time I have a negro foreman, and I expect everything to be all right when I go back there. I have never had any burnings and I do not have any stealing, and the negro and I get along just as well as we possibly can. The negroes on my plantation were born and raised there, some of them before the war, and they do not think about leaving there any more than I do. Mr. Lovejoy spoke about the darky and watermelon to-day. I said to a neighbor of mine the other day, who had some watermelons stolen by some negroes, that, if I was a justice of the peace and you brought them before me, I would not fine them. You have no right to put such a temptation before the darky. I was of the opinion that the man ought to be fined for doing it. I believe the presence of the negro in the South will retard its progress, its industrial and moral development, and its advantageous development, and its social development, agricultural development, and all other kinds of development; and the question is now, What are you going to do about it? Bishop Turner advocates a separation of the races. I am with him on it. I think it is the best solution of it. He wants Congress to appropriate \$100,000,000 to colonize them, and I am in favor of that. If I were a member of Congress, I would vote for it, or any other bill, to relieve the situation. I think it a good investment for the people of this country, because the relations are strained now. It will pay us to get rid of them at any cost. That is the way I feel about it. There is no question but that if the negroes were removed from our country their places would be filled in the future by more intelligent labor.

Q. Do you know about the Fitzgerald settlement?—A. Yes.

Q. Does that illustrate the statements just made to a very great extent? What are these Fitzgerald people doing?—A. I went over to Fitzgerald when it was first started. It is only about 50 miles below us. I went there a few days ago as a guest of these people. They were celebrating the erection of their gas and water works. They started out with the idea that they would have their own people in there, and that they would not have any darkies.

Q. Are these people all from the West and North?—A. Yes. They have a certain territory there within which they sell only to people congenial to them.

Q. They do not sell to colored people?—A. No; not at all.

Q. They do not let them in the city either?—A. Not to buy property.

Q. They own no property in the city?—A. That is my idea.

Q. They are prospering very well, are they not?—A. They seem to be very well satisfied. I stayed there during the afternoon before they had the banquet that night, and all the next day, and they seemed very much pleased with the town. They are putting up fine buildings all the time.

Q. (By Mr. PHILLIPS.) In what States, Territory, or country would you establish these colonies of which you speak?—A. I have no choice about that. I think that ought to be left very much to the negro. If he wants to go, let him pick out his country.

Q. Would you colonize them in this country or some foreign country?—A. That is a matter for future consideration. If I had my choice about it, I would put him in a foreign country; but I do not know as we ought to put on a foreign people something we do not want ourselves.

Q. (By Mr. KENNEDY.) Is it practicable to get rid of the negro by colonization, and would they give the suggestion of Bishop Turner, or anybody else, consideration?—A. That is a question—whether it is practicable. It is a question I do not discuss with many of them, because it is one that they are not prepared to handle; but now and then I do ask one about the question, and I do not believe they want to go. They do not want to leave that country because they feel it is their home. The other day I told a story to a negro. He has been around about my farm house for a number of years. He wanted to say something about trade; he wanted to make the next year with me. Says I, "Next year? I thought you were all going home next year." He says, "What home?" "Well," says I, "Bishop Turner wants them all to go home. He has a home for them." He says, "What home talking about?" I said, "Africa." He said, "I never been to Africa; I no' got no home there. I will not; if he want to go there he can go; I can get a home here. I kill nobody, and I don't reckon they will kill me, unless something to be killed for. I no scared of their killing me; and Bishop Turner can go if he wants to; I no go." Well, that is what that ducky said, and all the other negroes are pretty cunning. While they have not the sharp intelligence of a great many people, they are pretty cunning. That might not have been just exactly like he felt about it, but that is the way he talked.

I want to say something else about the negro, as long as we are on that line. A few years ago I asked a certain gentleman, who lives in the negro belt in our country, how long it would be before a certain territory in our section would be given over entirely to the negro. He smiled, and leading me a little farther on he says, "It won't be long before it is given over entirely to the negroes, and you will live to see the day when it will be given over to deer, wild cats, etc. The negro can not subsist by himself." I have lived to see it. It is within 20 miles of where I live. You put an object lesson before them, and they are great people for imitation. It kind of buoys them up, and they do more work, especially when there is somebody to stir them up every day. If you put them off to themselves, they are not self-supporting. You can not put them off. Give them territory and a year's rations, and in 5 years' time they will not own anything in the world. They will not make enough to support them for 12 months. The only way I farm with them is by having to see them every day myself, or have somebody else see them.

Q. Are not the people of the South so greatly dependent upon negro labor in agriculture that they would not be apt to look with favor upon that suggestion of colonization?—A. I do not know whether they would or not. They might not know it was for their interests. I hope I will not appear to be too egotistical. I was riding with a man 15 years ago, and we were talking on that line. I said to him, "The best thing for the South would be for every negro to leave by the 10th day of January." He said, "All I have I made out of negroes; wherever they go I am going to follow them." That man to-day is without a home. He finally got to the place where he had to rent out his lands and move to town, or did do it, and borrowed money from the loan association. It sold his land when the note came due, and he is to-day with a family of children without a house and home. There are a number of other instances that way, and a great many other people feel, perhaps, just like he does.

Q. Have you labor in Georgia to supplant the negro labor?—A. No; but it would be better, in my opinion, to let lands lie out 1, 2, 3, or 5 years, if necessary. I do not think it would be better for them in the beginning, but I do not know of anything that would be better for the people of the South and better for the people of this country than to get rid of the negro.

Q. Would you prefer to get rid of the negro and have white immigration come from other countries?—A. Yes.

Q. (By Representative LIVINGSTON.) Does the cotton producer of the South have anything to do with the price of his product?—A. Nothing in the world.

Q. Who prices cotton?—A. The price is made in Liverpool and New York City.

Q. Is there an unreasonable amount of tare on the cotton?—A. I do not know that there is; 24 pounds is what I understand it is.

Q. Is it true that you do not get anything for the bagging of cotton?—A. Yes, that is true.

Q. Do you get anything for the wrapping?—A. No, we have to furnish that.

Q. If your cotton was priced in this country and controlled in this country, do you think you would have more sympathy from New Yorkers and Bostonians and Baltimoreans than you get from Liverpool?—A. I really do not know. I hardly think we would. I think the Bostonians and New Yorkers would price it to their own interest.

Q. Is it true that the Liverpool cotton man sells his cotton to the manufacturers of Europe?—A. It is supposed he does.

Q. Do they manufacture and sell cotton to the world, a great deal of which comes back to this country?—A. Yes.

Q. Are these European manufacturers about upon a level with American manufacturers?—A. No; I think there is considerable tariff on their stuff.

Q. Are they not likely to make the cotton planter of the South pay it?—A. That is reasonable; that all comes out of the planter. Of course there is no question about that, just like the farmer pays all freights and all tariffs and all other expenses; no getting around that.

Q. And whatever advantage the manufacturer of this country has it comes out of the producers of the cotton?—A. Yes, of course.

Q. Does not that help to keep our people poor?—A. Yes, perhaps to that extent.

Q. Please explain the utter helplessness of the Southern landholder, financially, as to credit, improvement by borrowing money, and anything of that kind.—A. He has not much chance to borrow money unless he goes to the loan association and borrows at a tremendous rate of interest. Mr. Witham is president of 25 banks in Georgia. He has banks all over Georgia, run on an independent scale; every bank is independent of every other, but he happens to be president of the 25. He was advocating the other day before the bankers' association the loan of money to farmers. I was so much impressed with his talk that I wrote him to come before the State Agricultural Association—that he was the man we were looking for—and make a talk along the same line. He said there that he had never lost a dollar on a farm and had been at it several years.

Q. Would the cotton producers of the South be vastly benefited if they could manufacture within their own limits the cotton that they raise?—A. Yes, I think diversified agriculture is the first step, and then I think almost equally important is diversified manufacture. We want to manufacture everything that we need and can make in this country, and we ought to manufacture right in my home town and your home town and everybody else's home town, so we would not have to pay any freight on it.

Q. That can not be done without money.—A. No.

Q. And the entire landed property is entirely worthless as collateral to borrow money?—A. Yes. Then the great benefit of that idea is that if people in the country would make enough at home for themselves and enough to feed the people in these towns, it would give them a market at home for the whole product they make, and I think we in the South would then have an ideal country. We ought to diversify our products at home, but the lack of money has been the great drawback, and the lack of a proper system of education. If we want to start a manufacturing enterprise in Georgia, in any part of the State, we must import, getting men from somewhere to run it. I think, when Senator Morrill introduced his bill in Congress to establish these colleges, to maintain agricultural and mechanical schools, it was one of the grandest measures ever introduced, and wherever advantage has been taken of it they have done a great deal of good; and and I am sorry, blush, to think that our State money is not properly applied. The instructors of the youth in our State have gone on the idea that the boys must be filled with Greek and Latin, and be prepared to go out and teach school, perhaps, or something of that kind. It never has occurred to them that his hand needed training. We have proven this kind of education, in my opinion, necessary. They sent their sons to school with the idea that the school people knew what to teach.

Q. Georgia has a colored industrial school and a white industrial school fostered by State aid?—A. Yes.

Q. The Savannah school?—A. Yes.

Q. They are making a beginning in that way?—A. Yes. I think we are doing a great work. I have my son, a boy 17 years old, at the technical school at Atlanta. I went to the president of that college and told him that I wanted the boy to know how to set a tire, set a plow, and shoe a horse. He said he taught nearly everything else but that.

Q. (By Mr. RATCHFORD.) Have you, in the State of Georgia, an industrial school for girls also?—A. Yes; at Milledgeville.

Q. (By Mr. KENNEDY.) You must appreciate the work that is being done by Booker Washington, at Tuskegee, Ala.?—A. Yes; I do. I may state that I have a negro tenant that lives with me that has a son at the industrial school at Savannah.

Q. (By Representative LIVINGSTON.) Then you have an industrial school, colored, at Savannah, and a school for white girls at Milledgeville?—A. Yes.

Q. And white boys at Atlanta, all receiving State aid?—A. There is another school, supported by Northern philanthropy—Clark University.

Q. That is also on the industrial line?—A. I am not really prepared to say what the nature of that school is.

Q. It has been charged down there that the railroads, banks, wholesale merchants, and everybody are bleeding the farmer. Would you care to make any statements about these things?—A. I may say this, that so far as the merchants are concerned, the prices they have charged in many instances have been exorbitant.

Q. Is it owing to the fact that the men have to buy on time?—A. Yes; that gives them leverage; and then the merchant justifies himself on this line: That he did not want to do anybody injustice; that he did not know what he was going to get, and he was running a great risk, and in running a great risk he had to have a big margin. This system of doing business has not always inured to the enrichment of the merchant who charged the fabulous prices, because it proved that he was taking a big risk, and he did not collect; he did not get the money. I think some of them do not pay him. The banks have put a stiff rate of interest on the farmer. I speak from experience. I have paid all the way from 10 to 22 per cent per year for money.

Q. (By Mr. KENNEDY.) Is there any difference between national and private banks in regard to the rates they charge the farmers?—A. I do not think there is any at all.

Q. There is no favoritism shown by the private banks over the national?—A. No; not that I know of. I want to be perfectly fair on that line. As far as I am concerned, the biggest trouble I have had was to pay them back and not in getting the money. As far as the railroads are concerned, the relations between them and our people are very cordial and have been for a number of years. I will state, as an instance of that fact, that the railroads have cooperated with our State Agricultural Society and extended us many courtesies, just upon the asking. They run their roads, of course, to make money, and it is possible that some of their freights are too high; I am not prepared to say; I am not a railroad man, and I do not know how much money they ought to make, and I do not know how much money they do make; but there is no real difficulty between the farmers and the railroads in my State.

Q. Are they regulated by the State?—A. Yes; we have a railroad commission.

Q. That regulates them?—A. Yes.

Q. And they control the rates of freight and depot buildings and everything?—A. Yes.

Q. Are the railroad properties taxed by the commission?—A. Yes; they tax them, but I do not know whether they get the taxes on the full value of their property or not.

Q. What interest in the South bears the burden of taxation largely?—A. I should say the land.

Q. What per cent do you suppose the land bears of the total taxation in the South?—A. I should say perhaps 90 per cent.

Q. (By Mr. PHILLIPS.) You have stated that the negro would not be self-sustaining even if the land were donated to him.—A. Yes.

Q. What would be the condition if he were educated along technical and industrial lines? Has it been sufficiently tried to say whether he would be self-sustaining?—A. That is a question. But I really believe that if the negro were to be left entirely alone for a while, at least, he would retrograde, no matter what educational inducements might be offered him; that he would retrograde for a while. Perhaps he might get back after a while.

Q. Are there not quite a large number of noted examples of negroes who have been educated proving successful both in the professions and in the industries, sufficient to warrant the conclusion that if proper care were taken they might all succeed, or a large number of them?—A. It strikes me that those are only the exceptions to the rule. I notice, for instance, in dealing with them—we have white farmers without any education whatever, who make a little start and improve from year to year. For instance, here is a white farmer who comes from ignorant people; his people do not know how to read nor write, and he does not know how to read nor write. After a while he gets on his feet and accumulates a little property. The negro, say, is raised amongst intelligent people, and after a while he starts out, and by a little persuasion and coaxing and general direction accumulates a little property. In a few years it is all gone. They get to a certain place and they go back. There are instances all over the State of Georgia that way. I have studied the question for a good while, and I have studied it closely. I started out on the idea, a few years ago, that I would make a permanent tenantry of these people, and I cut my land all up into one-horse farms, two-horse farms, three-horse farms, and four-horse farms, and I gave them a comfortable house and stock, and I said to them that I was not after making any

money on goods. "If you want to get a little money, we will go down to the bank and sign a note together, and you just feel at home here just as long as you pay me the rent." He would go along and probably get the mule paid for, maybe two, and go, maybe 2, 3, or 4 years, and the first thing you knew he was all gone to pieces.

Q. Do not white people fail in the manner you have described?—A. Yes; but the negro fails almost universally. We have just exceptions enough to prove the rule.

Q. Is it not a fact that in this city and a great many places in the North negroes have accumulated a great deal of property and made successes?—A. Yes; when you put it in the aggregate, that is true.

Q. You have then but a very small per cent of what you would call thrifty, industrious negroes, who have accumulated anything in your part of the South or in the South generally?—A. No, we have not. If you give him a good price for cotton, the darky will do pretty well, because he will make cotton and he will make more out of it than anything else; but when it comes to growing other things, he is not in it. He may get there after awhile. But this I will say for them: They are the best-natured race of people on the face of the earth; they are accommodating; they are naturally polite and all that, but they are careless, they are indigent, and they are improvident. Generations may be able to instill these other qualities into them, but they are not there now, as a race.

Q. As they have only had their liberty 33 years, do you not think that there are indications of sufficient progress to warrant the conclusion that they will improve?—A. I used to think so, but I have my doubts about it now.

Q. There are very few races that have come out of slavery as the negro has, that have made very eminent progress in that time, even the whites.—A. Yes; that is true.

Q. (By Representative LIVINGSTON.) What per cent of these colored people become landholders in Georgia?—A. The per cent is very small; I do not know the per cent. There are a good many of them that became landowners that do not own their land now.

Q. Are these colored people prone to use intoxicating drinks?—A. Yes; they are very much inclined to drink whisky, and they have very little regard for their morals.

Q. Is it true that the white people have forced prohibition in almost all the counties in Georgia, largely to keep these people away from the doggeries and low drinking places?—A. That is true.

Q. How many counties in Georgia now are prohibition counties?—A. About 111.

Q. One hundred and eleven out of 137?—A. Yes.

Q. Has the great moving cause been the presence of this race?—A. Yes; to get the whisky away from them. When a negro is polite and pleasant and agreeable, if you load him up on whisky he will be a very different negro and a dangerous negro, and we do not want whisky kept in the country.

Q. Let me ask you if these terrible outrages—arson, murder, and rape—are not usually committed by a class of those people that are all the while drinking and all the while drunk?—A. I think it is true. Two years ago, within 8 miles of where I lived, there was an old gentleman murdered. He was sitting in the house with his wife, and a couple of negroes went in with an ax that they picked up near the woodpile and knocked him in the head, just as we would a hog. When I got there the next morning, he was still sitting in the chair, just as he was killed, and his wife was on the floor. Fortunately she was not killed. They thought they had killed her. They robbed him of his money. I said right then and there: "There is one thing you can set down" (we saw none but negro tracks around there), "this crime was not committed by a negro that owned a mule or a foot of land or any other piece of property." I have always been an advocate of bringing them up on that line. I say whenever any man is a property owner, he is a better citizen than he was before, if he does not own anything but a cow. Sure enough, we traced this thing to a couple of negro tramps that followed up and down the railroads and gambled and drank whisky with the negroes after they had been paid off. They are the classes that commit the crimes.

Q. As a race generally, they are kind and docile and good laborers?—A. Yes; that is true; but they are careless in their methods and seem naturally averse to improved implements.

Q. (By Representative BELL.) Is it a fact that almost every avocation now is completely organized outside of the farmers?—A. Yes; that is true.

Q. Do you know of any organization to raise the price of the labor of farm hands?—A. I do not. I do not know of any to raise the price of farm products either.

Q. Is there any real organization to raise the price of farm products?—A. No.

Q. Now the price of practically everything that grows is fixed by the syndicate, is it not?—A. Yes.

Q. In your speaking of a remedy, it is undoubtedly a good idea that you have manufactures all through the country.—A. Yes.

Q. I want to ask you if that is possible under the inclination of the transportation companies and manufacturing companies to manufacture at great centers like Chicago, for instance, and other great terminal points of railroads?—A. My impression was that these railroad commissions were organized for the purpose of protecting the smaller towns against the larger ones on that very idea. Not being a manufacturer, I am not prepared to say what the rates are and what the discrimination is between these smaller towns and the larger ones. I have never investigated that.

Q. Do you know, from the investigations of the Interstate Commerce Commission of the cases before it, that the general custom of transportation companies is to favor great manufacturing centers, for instance, through a system that they call common points?—A. Yes.

Q. For instance, they will say that the city of Denver, in Colorado, is a common point, and in shipping sugar from San Francisco they will charge you more to stop than to go on 300 or 400 miles before they reach the common point?—A. Yes.

Q. Do they not do the same thing generally in manufacturing—take a great city and say that ought to be a great manufacturing city or a great distributing point, and give it a rate?—A. We hear of those things. I am not prepared to state on that, because I have never investigated it at all, and I have never had any interest in any manufacturing; but it seems to be the idea that that is done.

Q. (By Representative LIVINGSTON.) Do you know of your own knowledge whether these cotton factories and others which are scattered through the little towns in the South are making money?—A. I hear in a general way that they are.

Q. That is the general opinion?—A. Yes.

Q. Those that are in the South?—A. Yes; for instance, Griffin, Macon, Columbus, Augusta, Jackson, etc.

Q. At these intermediate points they are making money?—A. That is the information that comes to me in a general way.

Q. Do you know whether the smaller towns get a proportionate rate with the larger cities?—A. I do not know. Ours is not a manufacturing town, I am very sorry to say. We have a barrel factory and an oil mill. I believe that is all we have.

Q. Was it not rather a rare thing to have banks in the small towns of the South, until the last 15 or 16 years?—A. I do not think it was, really, but I think we have a great many more now than we did then.

Q. Was there a great multiplication of banks 15 or 16 years ago, becoming nearly as numerous as blacksmith shops?—A. We have a great many more banks, and this same man, Mr. Witham, is president of 25. He has organized them within the last 15 years.

Q. Probably running them all on the same capital?—A. No; he goes and gets people interested; he says: "I will take so many dollars' worth of stock, and you get your people here in town to take so many." Then a man will say, "I have no money," and he says, "I will tell you what you do; you pay \$200 in stock and I will loan you \$800," and he has some man up here, I do not know where, that loans him the money. He loans it to him at a cheap rate, 5 or 6 per cent, on his stock, and he has made considerable money. I think Mr. Witham is doing considerable service at that.

Q. You think if a farmer can borrow money at 7 or 8 per cent, it is a godsend to him?—A. I think it is a great deal better to borrow money at 7 or 12 per cent than to be cursed with a mortgage of from 50 to 100 per cent.

Q. Is it not leading to absolute and unmistakable destruction when a man goes to farming on money at 8 per cent or 7 per cent or 6 per cent?—A. I do not think so.

Q. Do you know of any general farm in the South that is paying a net profit of 6 per cent?—A. Yes; I think I could mention some.

Q. Do you think it is a general thing?—A. I do not.

Q. It would be quite exceptional, would it not, if an ordinary farm should pay a net profit of 6 per cent on the investment?—A. I do not see why, right at this time. There is no question but what in the last 2 years our farms have been operated at a loss, because I think it takes about 6 cents to pay the cost of the production of cotton. But we do not propose to stick to that line, and I believe we can switch off on other things that will make our farms a paying investment.

Take into consideration, too, that our lands can be bought all the way from \$3 to \$8 and \$10 an acre.

Q. Do not the statistics of 1890 show that the general farmer in the South was not only making no money, but was eating up his capital?—A. I do not recollect what they show; I am not posted on that. That talk has been going on for 20 years.

Q. (By Mr. FARQUHAR.) In the matter of cotton, does the crop raiser sell to the storekeeper?—A. Not necessarily.

Q. Where is the immediate local market; in whose hands is it?—A. They carry it to the commission merchants, who sell it to the export buyers.

Q. That is, the local commission buyers?—A. Yes.

Q. They are really buyers upon commission?—A. They have their agents in all interior points.

Q. Where are their headquarters?—A. They are located at Savannah.

Q. Do they ship immediately there from the local market?—A. Yes.

Q. First of all it is taken from the farm and placed in the hands of this commission merchant?—A. Yes; the commission merchant simply sells it for the farmer to the buyer. He is the representative of the exporter, and he charges the planter a commission.

Q. There is a profit from the producer to this merchant?—A. To the commission merchant.

Q. There is a profit between him and the man who ultimately ships?—A. Yes.

Q. There is a profit from the shipper to the Liverpool market?—A. Yes.

Q. And there is a profit in the brokerage on the Liverpool merchant?—A. Yes; the exchange.

Q. None of those parties can have any claim on the profits of either the preceding ones or the ones after him?—A. No.

Q. Your idea would be that, instead of spending all these profits in Liverpool, if we were paying that profit in Augusta or Savannah, that profit should be taken out in the manufactured goods of your own State?—A. That is right; that is my idea.

Q. So that the whole total of the worth of the article as a raw material and the profit that comes to it in the manufactured state would remain in the State of Georgia?—A. Yes.

Q. And you think that is the commercial remedy for the cotton question in the South?—A. I think so. The cotton crop from all over our State is 1,000,000 bales. When it is manufactured into the coarsest kind of cloth, for instance, it is worth \$5,000,000; when it is manufactured into better cloth it is \$40,000,000. There is \$40,000,000 for Georgia instead of \$25,000,000.

Q. What are the inducements for people to go into Georgia to manufacture cotton?—A. I am a reader of the Manufacturers' Record, which frequently speaks of workers for the South. I am not capable of doing much in that line. I would be glad to be numbered amongst those people, but it seems they are continually striking at the idea that there is some inimical legislation in some of the Southern States that frightens capital out. If there is any in Georgia, I do not know of it. If there is any disposition on the part of any people in Georgia to fight capital, I do not know it. We want to get our money as cheap as we can, but we certainly have no objection to cotton factories coming there. We want them to come there. There is not a town in the State of Georgia that I know of or that I have heard of that would not offer them inducements to come, and I do not see any reason why there should be this fear. These loan associations have loaned their money there, and they generally get out of it their 7 or 8 per cent, and they pay their agent so much. Now and then they have to foreclose, but I do not hear of anybody pleading usury or anything of that kind. I think they hate to give up the land, of course, but when they can not get the money somewhere, where will they go? I do not see that there is any great conflict between us on that line.

Q. (By Representative LIVINGSTON.) What advantages have capitalists there, to entice them to go South and manufacture cotton? Will you say we have a good climate to manufacture in, or not?—A. I think so.

Q. Have we cheaper labor than they have in Massachusetts or anywhere else?—A. I reckon our labor is as cheap as it ought to be anywhere in the world.

Q. We have no State laws there to force them to 8 hours or 9 hours or any other hours?—A. No; nothing of the kind.

Q. They can work 10 hours or 12 hours or 15 hours if they want to?—A. I suppose that is entirely governed by the agreement. They should not work them, I think, longer than the endurance of the worker would justify.

Q. They work in wood houses, and they are not compelled to build of brick and stone?—A. Yes.

Q. You can spend all winter in a frame house?—A. Yes.

Q. (By Mr. KENNEDY.) If you had these laborers in the cotton mills, do you not think it would be but a short time before they would be organized and getting as good hours and wages as in Massachusetts?—A. I should think so.

Q. Would you not like to see them do it?—A. If they did, that money would still be in Georgia?

Q. Yes.—A. That is what we want.

Q. (By Mr. FARQUHAR.) It is for the salvation of your State, as you are cotton raisers and determined to raise cotton, to have this capital come in, have it on the ground, to retain the money for your raw product and your manufactured product?—A. Yes; that is the way it always ought to be.

Q. How do the lands of Georgia compare in fertility with those of Virginia and Maryland? Is yours as good a State in that respect as those States?—A. I really think so. I am partial to my own State, and I might not be a competent witness when it came to answering that question. I really believe, though, that if a man will go to Georgia and start right there is no better country for a farm. I think it is the ideal home of the farmer. A farmer who stays at home and raises what he wants at home—there is a difference between him and the speculative farmer. Where a man can be at home with his own family and raise everything that he can eat at home, it is the ideal place for him. I have some negro tenants who are living a great deal better to-day than a great many people in cities. Just take one instance: I have a boy who started last year, and he is not at all above the average. According to my instruction, he planted certain crops. At the end of the year he had a plenty of corn and fodder, plenty of bread, vegetables, and potatoes; he had plenty of sirup all this year, and he had plenty of meat. He has not wanted for one thing in the way of anything to eat. He had his milk, butter, chickens, and eggs. What more did he want? And he has had his melons and his fruit.

Q. (By Mr. KENNEDY.) You spoke of the difficulty which the Georgia farmer had in getting out of cotton raising. You have been diversifying over your whole plantation. Have you made or lost money as the result of this new departure of yours?—A. If I had not made a departure I would not be farming now. I do not know that I have made any money; I have managed to keep from breaking; and if I had not done that I would not be farming.

Q. You took the advice of the gentleman from Mississippi, who, you said, spoke about 15 years ago?—A. Yes.

Q. Have you not solved the difficulty for your farmers in the South?—A. I do not claim I have solved it more than anybody else. I have been preaching it everywhere I could—diversifying agriculture and diversifying manufactures. It is a hard thing to get out of cotton raising; we need a leverage that must come in the way of some money.

Q. You had that leverage?—A. No. Some people have a knack of borrowing the other fellow's help, you know, a little better than other folks. I have seen that, for instance, in buying fertilizer. A man may appear to be a pretty good farmer, but he does not think; he has no financial ability. He may go along and give \$4 or \$5 more a ton for his fertilizer than I will, or he may wait until he needs some and go down and get the money and buy it. If he would buy a stock of it when it is low it might be done, if he knows how to do it. He may have gone to a bank, but he does not know how to do it. The banks have held out the idea that they do not want to loan money to farmers; and whenever they go the idea is always that they may be able to accommodate them, but money is mighty tight, though they may strain a point and let you have it. That is the cry that the farmer has always heard, and when the bank man wants to know how much money he needs and he tells him about a hundred, he will want to know if he can not get along with fifty, and maybe he gets seventy-five; and that is the way they generally run; and he would rather go and pay a little more in a great many instances. For instance, a man in Macon, 50 miles above my town, said, "What is the matter with the farmers?" I said, "What do you mean?" He said, "They do not seem to come to town and want any money." I said, "You people say you do not have any money." And this man, who was president of a bank, said, "I guess that is the idea; they stay away for that cause."

Q. You have said you are looking for a way out, and the colored people are looking for a way out. It seems to me from your testimony that you have found a way out, and that this colored man you speak of, who is a tenant of yours, following your advice, has found the way out of his difficulties.—A. Yes. Well,

farmers, as a rule, do not think about their business, do not study their business, and do not work at their business with the business methods that other people use; and the very fact that they will not, and that a wrong method will prevail among them, as a rule operates against every other man who wants to do it properly. In a community where the majority of the banks pursue a wrong method, those who want to do it right can not succeed. The same way with a railroad; those who want to run them wrong, on their basis, do so, and those who want to run them in the right way can not succeed. And it is a fact that when the majority of the farmers go the wrong way, they bring the rest down with them.

Q. (By Representative BELL.) Does not that come out of the fact that the farmers have never been organized?—A. I am a great advocate of organization among the farmers, not to oppress other people, but to keep other people from oppressing them.

Q. Do you not think that the wage-worker gains from what he learns in his organization, and so with the banker and the merchant, and that the farmer is weak on that one point?—A. I think so.

Q. That he is not organized, and therefore he is not educated?—A. I think so.

Q. (By Representative LIVINGSTON.) Do you not think that they ought to go into a combine like the sugar trust?—A. We ought to organize. I am an advocate of it.

Q. You ought to organize and become equal with other communities in these great methods.—A. Yes, we ought to organize by all means in the world.

Q. (By Mr. RATCHFORD.) Your testimony is not exactly clear when we compare it with testimony of other witnesses from your State and from the South. You stated, I believe, that your State was not adapted to stock and cattle raising?—A. I said it was not peculiarly adapted to that. We have not a country that is peculiarly a wheat country nor a corn country, nor a stock country; but it is a country, in my opinion, peculiarly adapted to diversified agriculture. The West can beat us making corn and wheat and oats, but when you take into consideration that we can make sirup, potatoes, rice, wheat, corn, rye, milk, and butter; that we can raise plenty of colts for our own home use, and horses, and a good article of beef, too, then I say that all these things together bring up the average and make it a desirable place. But to produce any one crop—I do not believe it is peculiarly adapted to cattle raising nor horse raising nor wheat raising nor corn raising. I would not advocate the entire stopping of cotton planting. I think we ought to have it as one of our crops, but I think we ought to have these other crops to back it up and have it to back up the others.

Q. (By Representative BELL.) You have a good climate and good land and short winter seasons. Will you explain why it is not adapted to cattle raising?—A. I will not say it is not adapted to cattle raising, but I do not think it is superior to some of the other countries, because our lands are not as fertile. Our lands are thin. The grass does not do as well in our long summers. It gets dry and dies. I have gone into cattle raising a little myself. A field that was cultivated last year will make a better pasture than the field that was not cultivated last year, and the field upon which the cattle graze this year will make better corn and cotton next year by reason of the cattle having been upon it, or by reason of its rest from the plow. I think in our country we need all these different agencies to work together for the common upbuilding of the lands. It takes a good deal of thought and time and attention to do it. I do not believe that one can take any one line exclusively and succeed on it.

Q. You do not believe then that you have the advantage of the Western country in the raising of cattle?—A. I do not?

Q. You say that the banking interests and the merchants of the South will not take your corn crops and wheat crops as collateral to as great an extent as they will take the cotton crop. Will you explain why that is a fact?—A. The cause involved is that when the corn matures the merchant is in a mighty tight fix. The farmer depends on the retail merchant, and we are in the hands of agents and subagents, and New York is holding on to secure the whole thing.

Q. (By Representative LIVINGSTON.) He must have the money and you have to furnish it?—A. He must have the money, and the farmer goes to the retailer, and the retailer to the wholesaler, and he goes to the bank, and that bank goes to New York and gets the money, and in the fall of the year everybody must be paid. The Macon banker, for instance, goes to the New York bank, and the New York banker says: "I am afraid of the whole thing." That thing was pretty well demonstrated by a sawmill man in our county. He is a kind of a wag and philosopher. He said he noticed how things ran. Every Saturday night the darkies he had working for him would come up and take off their hats and ask for their little money, and he said he would step over to a certain man's house and get it

for them. He would go to the man and take off his hat and ask for a little money, and he said he thought to himself if he got in that man's place he would not have to do that. A few days after he happened to be up in Macon and he saw that fellow up in Macon bowing and scraping and asking for money, and he said "I heard them say that the Macon fellow went up to New York and just beat everybody bowing and scraping."

Q. Have corn and wheat as staple a value as cotton?—A. No. When corn matures, say in my town, everybody then has corn enough to do him until Christmas. Nobody there wants to buy corn. The merchant can not take that corn and use it; he can not pay the bank with it; and if he gets a carload of it he must ship it in competition with the West, and whenever he does that there is nothing in it for him.

Q. Is the statement that you make as to the people in your country being in the hands of agents and subagents generally true of the farmers?—A. I think that is true.

Q. (By Mr. RATCHFORD.) You have stated very plainly that the farmers of your State were going back, or, if not going back, that they are not progressing. Do you attribute that fact very largely to the employment of colored labor?—A. Yes; I think that is true to a very great extent.

Q. What wages are usually paid to colored farm hands?—A. We pay them from \$6 to \$8 a month. We give them in addition to their wages 4 pounds of meat and a peck of meal, and we give them a good house to live in, and we give them an outside patch of 2 acres to work on Saturday evenings, upon which they can make generally about a bale of cotton.

Q. How do those wages compare with the wages paid to white labor where they are employed in your State upon farms?—A. I think we give them about the same thing.

Q. Do you know of any other section in the country that pays its farm labor at as low a rate as is paid in Georgia?—A. I do not. It is not in the amount of wages; it is the efficiency of the labor. I have always argued that, and my father before me argued that question.

Q. The amount of the wages does not determine the efficiency of the labor?—A. And it does not determine the need of the people. It is the efficiency of the labor. A great many negroes I would not hire at any price. The more you pay a negro the less efficient he becomes as a laborer.

Q. You believe he is worthless at any price?—A. No; I say the more you pay the negro the less efficient he is. I will demonstrate that. The more you pay him the less efficient he is as a laborer. Now that is the whole plan. For instance, about a year ago I was talking with a sawmill man in Dodge County, and we got to talking about the negro problem and the labor problem, and he said he started them to work in the sawmill. He paid them 75 cents a day. It is hard work, and for a while they wanted a little better work and a little better wages, and he gave them \$1 a day. They had been working 5 days and they commenced to work 4 days. He said they gambled. They commenced working 3 days in a week and gambled and drank the balance of the time. And a few days ago I had a man put in a wire fence for me. I was in a hurry with my crops and I could not fence them in in the spring. He was to be there Monday morning, but he did not get there until Tuesday. I said, "Why didn't you come yesterday?" "I could not get my hands." I said, "Well, what are you paying your hands?" And come to find out I knew what the trouble was. They could make enough in 3 days to live on a week, and he worked then from Tuesday morning until Friday night, and the last time they quit Friday at dinner, and he could not keep them there. That is the truth about the negro. Now, I have an old foreman living at my house, he was born there before the war, and one day I was in the field and I said, "I could give you twice as much wages as I do if you would appreciate it and try to work up, but, if I paid you twice as much as I do, you would not be worth as much as you are now." He says, "No, that is a fact." And I will tell you why, because he would have more money to gamble with and spend for whisky.

Q. What influence does colored labor have in the South to keep the wages of the white men down; does it keep the wages down below what they would be otherwise?—A. I do not know. With the presence of the negro there, it gets into the white man's heart that the farm work is menial; that it is degrading for a white man to do; and I will say this, that you can not employ on farms the best white men, because they will go to town and live on air and water before they will go out and go to plowing for a pretty good salary.

Q. I infer that the reckless and improvident habits of the colored man have much to do with cutting down his wages?—A. Yes; I think that.

Q. That being the case, will wages set by them in these improvident habits have this influence on all other classes of farm labor?—A. Yes.

Q. You stated that you need a farmers' organization, not for the purpose of crushing anybody, but for the purpose of preventing others from crushing them.—A. For their own protection.

Q. Do you believe the labor employed on the farms should also organize for that same purpose?—A. I would not state about that. I do not think there is any necessity for the farmers to organize to protect themselves against the labor. We never have any trouble with them. I will tell you what I said last fall: The question came up, What shall we pay the labor? and I made this remark: "Gentlemen, we are paying them little enough now, and whenever it comes to a place where we can not pay them as much as we are paying now, we had better quit. I do not want anybody to work for me for less than good victuals and good clothes, and when it comes to that, I will quit the business."

Q. Taking the matter as a broad proposition, you believe in the farmer organizing to protect himself from whatever influence seeks to destroy him?—A. Yes.

Q. Would you accord to the laborer the same right?—A. Yes. I think if we had the farmers thoroughly organized all over the country that we could manufacture all the cotton we make in this whole country right in this country. Here comes up the great question of the uniform bale, the square bale, etc. They want the farmers to indorse this and that. But I do not think that cuts much figure one way or the other. The great thing for us to do is to manufacture it right at home; and if we had them organized, we could run our factories and farms and never would be out a dollar, and run them in connection with the merchant.

Q. (By Representative BELL.) Who gets the better part of the product of the farm in the South—the hired man or the owner?—A. The hired man, for the last few years. The negro laborer on the farm is better paid than a great many people in town. To demonstrate that I will say that I had a boy that had been living with me a number of years; quite an intelligent negro; could read and write quite well. He asked me one day if I would not be willing to pay him what draymen got in town. I had a little farm near Hawkinsville. I said, "Yes; I will be willing to pay you what they get. What do they get?" He says, "They get \$15 a month." "You want to work like they do?" "Yes; I would like to work as they do." "I will pay you what they get and settle with you every Saturday night. I want you to understand one thing: He pays so much house rent; he pays for his 4 pounds of meat and peck of meal." "Yes; I understand." "He works from Monday morning until Saturday night. He does not have any Saturday off nor any outside patch. And I want you to understand another thing: Whenever you want a load of wood I will haul it to you and charge you \$1 for it." He says, "Boss, let's go back to the way we are now."

Q. His \$6 a month is his profit?—A. We just give him his 4 pounds of meat. Now, if he wants any sirup, he buys it. He has this little piece that he calls his garden, and he will say he is going to have the finest garden of anybody, and he will get another dorky to help him, or maybe his wife will, in planting the seed all around the house. He is getting 2 acres of land, and he will plant his cotton outside, away from the house. He works his cotton very well. He does not work his garden, and that is all he makes. He has his cotton.

Q. It is charged here, and I have heard it stated as a fact a great many times, that the elevator combination that buys up the corn and wheat of Minnesota and Nebraska will ship it from there to New York cheaper than the farmer in Pennsylvania can ship his to New York. These charges have been made for years publicly and stated here. Do you know whether such discriminations extend to your country?—A. I really do not know; but I know this, that the freight on corn from our place to Chicago is about 15 cents a bushel. I sold a little corn at Hawkinsville and I had to send it out at about 43 cents a bushel. The reason I got 43 cents was because they gave me the Chicago price with the freight added. I suppose if I had had to ship that corn from Hawkinsville and compete with the man in Chicago my corn would have been reduced to about 25 cents a bushel; and when you talk about our raising corn in my country for 20 and 25 cents a bushel, that must mean that we are not in the business at all.

Q. (By Mr. A. L. HARRIS.) Do you raise a sufficient amount of corn to supply the demand in your State?—A. I think there is a good deal of corn imported into our State. I will say that to the discredit of our people. There is no excuse for it. They are able to make enough corn to do that in our own county. I do not know the reason why corn need be shipped in there. We ought to make enough corn.

Q. When you buy your subsistence you buy it from the Western farmer with the profits of the middleman added?—A. Yes.

Q. Corn, meat, and everything?—A. Yes.

Q. You can raise mules in your State?—A. Yes; my grandfather before me raised some as fine as anybody, on a limited scale. He did not go into it exclusively.

Q. Your State is fairly good for dairy products, is it not?—A. Yes.

Q. You can raise horses?—A. Yes, we can raise horses; but I will say right now that I would not advise a man to come to our State to raise horses in competition with Tennessee and Kentucky. They can raise a better grade of horses than we can.

Q. With diversification, what reason can you see for Georgia being a less productive State than Ohio, taking land, labor, and capital into consideration; outside, of course, of the dearth of capital you have now?—A. I really do not think our soil is as fertile, take it all the way through, but it is adapted to a great diversity of crops. I do not think we make as much per acre as you do in Ohio.

Q. You can raise crops that Ohio can not raise?—A. Yes.

Q. It requires more fertilizer?—A. Yes.

Q. About what is the average length of time that your pupils remain in school per year?—A. I think about 9 months.

Q. From what age?—A. They go from 6 years of age up.

Q. That, as I understand, is for both colored and white?—A. Yes. On my plantation we have a school for colored people, and the school fund now, I think, has been about exhausted, and the teacher is carrying on the school still by private subscription amongst my own people. The schoolhouse is right on my own plantation. I furnished them the land and bought the lumber and all the material for them to put it up, and they put up a brick schoolhouse and a church.

Q. Are you obliged to keep white overseers to look after your colored men?—A. I just say that was an expense that I could probably do without, and I was going to do it if I possibly could.

Q. Have you made money by the change?—A. I am trying to save what I was paying them. I talked to my people very plainly. I just told them, "I can not afford to hire a man during the year to be idle. I am going to start on this line and I am going to try to do the work, and if you will go on and do what I tell you, we will get out without any white boss, but if necessity comes, I will hire somebody to drive it out of you." We have got along very well so far.

Q. Please state in as few words as possible, if you have anything in your mind, what your remedy is for the conditions in the South.—A. My remedy, in a nut shell, is diversified agriculture in the country, and let the people in this country make everything they want at home and enough to feed the towns and cities—corn in the country, wheat in the country, meat in the country; and manufacture everything that we can in our own limits, in our towns and cities.

Q. What legislation would you suggest, that the nation could, under the United States Constitution, pass, to give you relief?—A. That is a great question. If there is any legislation that will bring about that state of affairs, I am in favor of it. When I was a member of the legislature of my State in 1894, and chairman of the committee on agriculture, that question was brought up, and I submitted a report to that committee, which was adopted and also adopted by the house, in which I made the very suggestions that I have just made here—that we favored any policy on the part of our State that would encourage the building up of manufacturing in the State of Georgia. It was a pretty broad proposition, but that was it. It was unanimously adopted by the agricultural committee of the house, and by that legislature.

Q. (By Representative LIVINGSTON.) You did have for a long time there an exemption from taxes?—A. Yes; some of the municipalities aid them now.

Q. (By Mr. A. L. HARRIS.) What is the prevailing rate of interest in your part of the State now?—A. I expect it is about 8 to 10 per cent.

Q. With the immense amount of capital we have in the North is there any reason why it does not go to the South when they can get such a high rate of interest?—A. I can not tell you. I have thought about that some and I can not tell you. I think there as a little apprehension on the part of some of the Northern people that perhaps their money would not be safe, but I do not see that experience should justify that apprehension. Not only that—I think they apprehend that the farmer can not pay this interest in the present condition of agriculture. It is not want of confidence in a man's integrity and his willingness, but it is a restoration of confidence in his ability to pay that we need. If one does not have confidence in another's ability to pay, he will not loan him any money, no matter how honest he knows him to be.

I simply want to state that my suggestion of what the remedy is for the condition of agriculture and the general conditions in our section of the State. I suggested that we wanted more diversified farming, more manufacturing; and I was

asked what national legislation I thought necessary to bring this about. It seems to me that I would first want this 10 per cent on State banks removed. I think that lands should not be outlawed as security by national banks; and I think probably it would be to the interest of the people to have a system inaugurated by which the land deeds could be offered as collateral, like stocks and bonds, and be more quickly transferable. Some, of course, would argue that would be against the interest of the landholder, but I do not think so. Then I do not think this gambling in farm products is a good thing for the people. We call it gambling; I think that is all it is. If there is any way to stop it by an enactment of Congress, I think it ought to be done. I do not think it is a good thing. From the agriculturist's standpoint, I would remove any legislation that operated against his interest in the interest of anybody else. The farmers, on the other hand, do not ask for any legislation for his special benefit. They have only asked for "equal rights to all and special privileges to none." Now, on the line of organization—I think we do not get enough for our products, especially for cotton. I see that Major J. F. Hanson, of the American Cotton Manufacturing Company, in an article recently published in the Macon Telegraph, and reproduced in the Manufacturers' Record, advocates the establishment of bonded warehouses in different centers, in order that the planter may carry his cotton there and get an advance upon it, take the money and pay the merchant, and let the merchant pay the bank in turn, so as not to be forced to sell it. You see this product is made in 12 months and sold in 3 months, and it is astonishing, under old conditions, that you could really hold out as well. Mr. Hanson is not a man that belongs to that class of people which thinks the Government ought to support the people, and I do not, either; in fact, he is a man of fine business qualities, and president of one or two manufacturing enterprises. I want to make myself clear on that point. While I think that this is the solution for all, there is something, perhaps, necessary to put us in a position, or to help us be in a position, to bring about that condition of affairs. I think that we have been talking too much on the line that the Government has been against us; and if you ever get an idea in a man's head that the Government is against him, there is no use trying to get him to do anything until he gets the right idea; he is in a bad fix. If we will all look on the inside, we are more than apt to find a remedy. I do not claim that our people have done all that they ought to do; I think that we could have done some things we have not done, and I think we could have left undone some things that we have done.

Q. I would like to have you give your reasons for your opinion that dealing in options and futures is injurious to the cotton raisers because the same thing affects the wheat raisers in the North.—A. I think it has a tendency to demoralize prices, whether it puts them up or down. I think if we are going to be governed by supply and demand that we ought to go on that idea, and let the real supply and demand govern it, and not the fictitious supply and demand manipulated in the book rooms of these exchanges, where there is forty, fifty, or one hundred times as much cotton sold in a week as we make in a year; and the same way about wheat. Mr. Leiter advanced the wheat market; the farmers got the benefit of it. I am not any more an advocate of that than I would be if he put it down to 25 cents a bushel. When the farmer gets the benefit of it the purchasers pay it. If the other side had been the strongest they would have carried wheat to 25 cents a bushel.

Q. You mean where there is really 1,000,000 bushels of spot wheat and 50,000,000 are sold, that injures the price of real wheat?—A. Yes; and it puts a fictitious value upon it.

Q. It destroys the law of supply and demand?—A. Yes, in my opinion. Now, why should a manufacturer to-day be able to go on the New York market and buy all the cotton he wants? He need not wait until I make any cotton.

Q. As I understand, the gambling goes further than the prospective supply; he might be able to sell the cotton planted, but you do not want him to go so far as to sell cotton you have not, never expect to have, and can not possibly get?—A. That is the idea.

Q. And therefore put on the market millions of bales of cotton which do not exist and never did exist?—A. That is the idea.

Q. (By Representative LIVINGSTON.) Do you know the amount of money tied up in deals with stocks—the current money?—A. I do not.

Q. (By Mr. A. L. HARRIS.) Have you any banks of exchange and deposits in your State?—A. Oh, yes; we have got two little banks in my town.

Q. Have they all of the facilities of the national banks, with the exception of issuing currency?—A. I suppose they have.

Q. They can loan money and take deposits and discount paper as well as the national banks?—A. I think they have all those privileges.

Q. Then a national bank has no advantage except the power to issue money?—A. That is all I know of.

Q. Do you prefer to have that condition of affairs to going back to the old State-bank plan?—A. I have always been opposed to the 10 per cent tax on State banks. If they want to prohibit State banks, let them come right out and say so, and not put a tax on them, because that is what it amounts to.

WASHINGTON, D. C., June 20, 1899.

TESTIMONY OF MR. P. H. LOVEJOY,

Merchant and planter, Hawkinsville, Ga.

The commission met at 2.25 p. m., Vice-Chairman Phillips, presiding. Mr. P. H. Lovejoy, being sworn, testified. The topical plan of inquiry on agriculture was followed in the examination of the witness.

Q. (By Representative LIVINGSTON.) What is your full name?—A. P. H. Lovejoy, Hawkinsville, Ga.

Q. (By Mr. PHILLIPS.) What business are you engaged in?—A. I am a merchant and a planter in Georgia.

Q. (By Representative LIVINGSTON.) What is the condition of the farmer and farm laborers of Georgia and the South?—A. I think the farmers are in worse condition than they have been. They are not prosperous in our section. They have been going back for the last 5 or 6 years. My experience in doing business with them, and then my experience with my own farm, shows that the conditions are not so good as they were years ago.

Q. Is the condition of the farm laborer improving?—A. The farm laborer can not prosper when the farmer can not prosper; it all comes under the same head. What the laborer gets he uses daily, and it leaves him without much to go on, and then the farmer is not able to help him much.

Q. What is the custom down there, hired help or crop sharing?—A. We rent, pay wages, and have crop work. We do all. We rent to some of them and share crops with some, and pay them wages; and I believe the man who gets \$6 or \$8 a month gets more than anybody else.

Q. The wage laborers fare better than the tenants and croppers?—A. I think so. In the last few years the products have been so cheap that it would hardly pay out. For instance, you go halves with the tenant; he furnishes the labor and you furnish the land, stock, and provisions to go with it; and his half would not pay his part of the expense.

Q. That being the case, how do the merchants South protect themselves in their advances?—A. Take mortgages on their land.

Q. And you hold the farm responsible for the crop developments?—A. Yes.

Q. Then when you let the cropper run it on his own hook; how do you protect yourself?—A. We take a mortgage on the cotton crop.

Q. At what profit on these goods do you sell to these people?—A. Size him up, and if he is pretty good, we sell him pretty cheap; and if he is a hard case, we just take what he makes and quit.

Q. What has led up to this depressed condition of labor and agriculture in the South?—A. It seems to me that it is the short prices and old cotton system we have been running in the South. When I bought cotton at 8 and 10 cents, it was all right; but when cotton goes below 7 cents there is nothing in it for the laborer, nor the planter, nor the merchant. The farmer figures his crop to get 10 cents for it. It has been this way now for the last 7 or 8 years; when the crop would sell it would bring 8 cents; and the next year he would figure for 8 and he would get 7; and the next year he would try to make it for 7 and he would get 6 cents; and the next year he would try to make it for 6 and would get 5 cents; so that just left him flat with the mules and land all mortgaged. Half of the planters in our country have mules and lands under mortgage, and they have been so for the last 8 or 4 years. These things seem to get worse every year, because the products they make will not pay expenses for making them, when they make cotton for less than 5½ cents. That is my experience.

Q. (By Mr. PHILLIPS.) Is it the superabundance of cheap labor that has so cheapened labor?—A. I think what did it was that the South started poor, and

there is nothing else made to bring ready money like cotton. Cotton is a product, you know, that will bring ready money every day in the week, and that has enabled the farmer to get hold of cash. They put forth every effort they could to make a cotton crop. I think 4-cent prices last year started them out on new lines. They are getting so they make provisions at home.

Q. If there had been only half of the laborers in the cotton States that there are there, or have been for some years past, would not cotton have been at a higher price?—A. Yes; I believe it would. I believe the labor that we have there must be worked some way, and cotton is about the only thing they know how to make. You may put them to work a farm; but my experience is they can not make anything but cotton, because cotton will wait for them. We can take a given day and tell him to work out the crop in 3 weeks, but corn, wheat, and other things would not wait; you have got to work them out at the right time. Cotton will wait, and you can work it out and it will make.

Q. Is there not considerable competition by cotton produced in other countries in the markets of the world that fixes prices?—A. There is some, I guess. I think where they do use our cotton competition is not so great.

Q. If there were grown only half of the cotton now produced in America, would it be a very much higher price in the markets of the world?—A. I think so.

Q. That would be so with anything.—A. Yes; it would, unless being produced in other countries to meet the markets of the world on these terms.

Q. (By Mr. FARQUHAR.) Suppose that the United States exported half of the cotton to the European markets that they do to-day, what effect would it have on the market price of the world?—A. I believe it would put it up.

Q. How much, do you think?—A. I do not know. I have not thought on that subject.

Q. Do you think it is the overproduction of cotton in the South thrown into the foreign markets that keeps the price of cotton down?—A. I do not think that is it altogether; I think that speculation has something to do with that.

Q. Did you ever notice the regular, even condition of the Liverpool market for nearly 12 months?—A. Yes; but they do the same thing over there, do they not?

Q. They sell futures over there and speculate in it the same as we do. You can take your judgment from the fact that they are dealing in cotton three or four times more than the product.—A. Yes.

Q. Would your general judgment be that out of 20 deals of that sort 19 men dealt with things they did not have?—A. Yes; no cotton in the warehouse to take out.

Q. Do you believe the Liverpool price of cotton makes the price for the world?—A. That was always my understanding.

Q. Do you know what countries are competing in cotton?—A. No.

Q. (By Representative LIVINGSTON.) If one-half of the cotton crop of America were cut off what effect would that have on the cotton fabric to be worn by the world; would it make it scarcer and higher?—A. Yes.

Q. Do you know whether there is a good demand for manufactured goods or not?—A. There is a good demand for them.

Q. Do you charge that to the overproduction of cotton?—A. It would not seem so. It would really work both ways. The raw material is going down and the manufactured has been going up for the last 6 months.

Q. Then you think there is something wrong about the prices made by that Liverpool operation?—A. It would seem to me that there was a "cat in the mill" somewhere, but I do not know where it is.

Q. Supposing the South manufactured itself one-half of the cotton it raises, would that be added to the wealth of the South and prosperity of the South?—A. Yes. Whenever we have to make a half a crop to get full prices we are not benefited.

Q. My question was this: if we manufacture in the South half of that we produce and export the other half, would not that add to the price of raw material?—A. I do not know as it would; it would add to the prosperity at home because that would leave money with us.

Q. Do you believe it would enhance the price of cotton in Liverpool if we shipped only one-half?—A. Yes; I do.

Q. (By Representative BELL.) You say it is remarkable fact that the price remains about the same throughout the year in Liverpool. Is not that the strongest indication that the same combination fixes the price and holds it?—A. It seems to me that is the cause or else it would fluctuate with other things.

Q. For instance, the combination that fixes the price of white lead—while the crude lead goes down in price, that will remain the same the year through,

because the combination itself fixes it?—A. That is right; cotton is nearly in the same fix.

Q. And then could the manufacturers of cotton goods uphold or fix the price?—A. It looks so to me. You take half the dry goods made—you will buy them just as the other fellow says.

Q. (By Mr. A. L. HARRIS.) Do you advance the goods to the cotton raisers on credit?—A. Yes.

Q. What margin do you charge for goods advanced?—A. We generally put a pretty good margin on cheap men because we have to take chances on them.

Q. About how much?—A. About 25 per cent.

Q. How do you charge what you call good men?—A. We sell good men at 10 per cent. We settle up what we call "papers" the 1st of September. We aim for 10 per cent clear, because you know there is a certain amount of leakage to business that no one ever found yet. You can not figure like you can when loaning money. When you loan money you know what you are doing. When you sell goods there is a leakage that has to be covered, and which you can not figure, and if you do not take care of it you will not last very long.

Q. Is that the reason why you demand such large margins from the cotton raiser?—A. Yes. You see; we take all the risk. You take the good per cent of them, we have nothing for collateral except the crop, and if they should fail and anything turns up that they do not make a crop, it is a clear loss, and so you see we have to figure for the whole crowd to pay it.

Q. Now, let me understand in regard to this 25 per cent. When you receive the invoice for the goods, is this price put on when marking the selling price of the goods?—A. We mark the cost price.

Q. And then do you have also a selling price?—A. Yes.

Q. Is this 25 per cent added to the selling price when selling on credit?—A. No, it is added to what the goods cost.

Q. You have various prices, then, in the same store for the same goods?—A. Yes. If a man comes in and we make a sale, we always let him know where he stands. We tell him we will risk his agreement. We can afford to take some risk. If he wants to do it, he has the privilege to take it or let it alone.

Q. Are the merchants prosperous in the South, as a rule?—A. No, not for the last few years. It has been all we could do to tote our customers with the money made in ten years. We are toting them with it now.

Q. You are not making any money.—A. If we keep things balanced up even we are doing pretty well.

Q. Do you keep a general store?—A. Yes.

Q. You sell dry goods, groceries, and general supplies.—A. Anything from a cambric needle up to a two-horse wagon.

Q. And this per cent of increase is upon all of the goods you sell?—A. That is, on time. We have had this system in the South for the last 30 years. It is bad for the merchant and bad for the planter. A good man has to pay for a bad man's account, which ought not to be. But you can not tell who is a good man; one may be good this year and bad next year.

Q. Where do you get your bacon and your corn and other supplies that you sell the cotton raiser?—A. We buy them from the West—buy it from brokers at home.

Q. And it is not raised in the South?—A. Now, this year we have been doing better. Our planters have made some supplies. We have handled a great deal of home-made supplies this year. We have bought about one car of corn this year. As a general thing we handle a great deal of corn.

Q. When you sell corn to the cotton raiser do you sell it at about the same price that you would sell it for if you had bought that corn in Chicago with freight on?—A. No; we are not in that business. We would not have any business long if we did that.

Q. Do you sell the corn you buy in Georgia at a less price than corn you buy from the West?—A. No, sir; we generally give the Georgia men the benefit of the freight in the price.

Q. (By Mr. PHILLIPS.) Is the corn equally as good?—A. Yes.

Q. (By Mr. A. L. HARRIS.) How much is corn worth down in your place now?—A. We pay 53 cents. We get 60 cents where we sell it for cash, and on time 75 cents a bushel, from which you can get an idea about the difference.

Q. How much is bacon worth?—A. Bacon costs us about \$5.40—I think the last we bought. We sell that at 6 cents for the money; on time we put it up anywhere from 7½ to 10 cents. You take the dinky and he just "blows" in what he gets to-day, and he does not figure for to-morrow at all; and we deal a great deal with the negro.

Q. (By Representative LIVINGSTON.) Do you want to say anything about bank facilities?—A. You can get plenty of money if you have the collateral. I think the ten per cent tax on State banks ought to be repealed.

Q. What collateral, personalty, generally?—A. Yes; that is about all you can use; personal security. Those national banks will not take mortgages on land, you know. It is too slow a process. You can not get your money out of it soon enough.

Q. (By Mr. A. L. HARRIS.) Do you refer to local banks as well as national banks?—A. Yes; all of them.

Q. (By Representative LIVINGSTON.) Farmers really do not borrow money, as a rule?—A. No.

Q. How do they get supplies?—A. Through merchants.

Q. And the merchants?—A. Through the banks.

Q. And where do the local banks get their money?—A. New York.

Q. And where does New York get it?—A. Usually it is from the Treasury here.

Q. A great deal of it United States money on deposit?—A. Yes.

Q. Have you any remedies to suggest about the condition of the farmer and laborer down South?—A. I can not see any chance for them, unless they change the process of farming or get easier money, because they pay too much per cent; the farmers are paying too big per cent for what they do. While I am one of the gang charging them, it works a hardship on the merchant; it puts the farmers in shape that they can not pay it, and wherever they are behind that leaves the merchant behind. If you strike a year when the product brings a good price, everything lies easy, but if you strike two or three years that it does not, we all feel it.

Q. Are the farmers in that section of the country able to switch right around and diversify?—A. No. You must take it by degrees. You can not jump right out of all cotton system and go into the other. They have not the means to do it with, and they must have help. The cotton crop is the only thing they can get ready money for in our section.

Q. Why do you not take corn and wheat and products of that kind?—A. We have no market there for it.

Q. (By Mr. A. L. HARRIS.) If you had a market, you would have no way of storing the wheat and corn, or anything like that?—A. No; and then they can not make enough corn and wheat there to the acre to make it interesting to go in it. Ten or 15 bushels of corn is a good crop in our country. That is the reason why we stick to cotton. Our average crop of corn is not over 10 bushels.

Q. (By Representative BELL.) What do you make in wheat?—A. Five to 10 bushels.

Q. (By Mr. FARQUHAR.) What is the reason of these small crops in your section?—A. You can not put as much on the land. I noticed on this trip that corn is all 2 or 3 feet apart. We have to put ours farther apart.

Q. (By Representative BELL.) What do you make of oats?—A. We make anywhere from 4 to 50 bushels, owing to how the land is manured and fertilized.

Q. (By Mr. FARQUHAR.) You are working that land now with fertilizers?—A. A small amount of fertilizer; that is all that it gets.

Q. (By Representative BELL.) How much hay?—A. We never gather much hay; but our land will make about 1 or 2 tons per acre.

Q. (By Representative LIVINGSTON.) You use grass down there?—A. Yes; the grass crop is worth more than the garden crop.

Q. (By Mr. FARQUHAR.) What kind of grass, Bermuda?—A. Yes, that is the best; but the grass that grows there mostly is crab grass and crow-foot grass.

Q. (By Mr. PHILLIPS.) Can you grow timothy and clover?—A. No; it will not grow.

Q. (By Mr. A. L. HARRIS.) What crop do you grow for fertilizers?—A. The pea crop, and then cotton seed, you know, is a great fertilizer.

Q. You can rotate the cowpea.—A. Yes, the cowpea is a fine fertilizer for our country.

Q. (By Representative LIVINGSTON.) You have to come to this country for goods?—A. Yes.

Q. (By Mr. FARQUHAR.) Is the cotton crop an exhaustive crop for that soil?—A. No.

Q. Does the cotton crop return anything to the soil at all?—A. Very little; but it does not take anything away from it. The seed is one of the best fertilizers we have.

Q. Is there a general impoverishment in your section of Georgia because of its having been cropped for a great many years?—A. It is owing to how it is cropped; if the crop is fertilized and rotated it builds it up every year.

Q. Have you much worn-out land down there?—A. A great deal of it.
 Q. Something like Virginia and Maryland?—A. Yes; been cropped to death.
 Q. Was not that one of the great reasons and the cause for putting in fertilizers—the impoverished soil?—A. Yes.

Q. And it ruins the soil; in fact, it takes everything from the soil and returns nothing to it?—A. That is it; and they use commercial fertilizer because it is easier to handle and to get better and quicker results; but I believe if the farmers would put the same amount of money into making a fertilizer that they put into the commercial fertilizer it would build the land up better and make better crops.

Q. (By Mr. A. L. HARRIS.) Are you a member of the board of education?—A. Yes.

Q. About what is your usual school term for the year?—A. Ten months.
 Q. What per cent of your school children attend your schools?—A. I reckon 75 per cent of them.

Q. Ten months is the term in the country or city?—A. In the city. In the country schools it is 5 months now. It was 6 up to this year.

Q. Are your school facilities good?—A. Yes.
 Q. You have good teachers?—A. Yes; we get the best teachers we can get.
 Q. The whites and blacks have equal advantages, except separate schools?—A. Yes; we try and give them good teachers.

Q. What degree of efficiency do they reach in education?—A. Well, on some lines the darky will go right along up with the white children, but in other lines he is off.

Q. Can you state the lines?—A. In writing and reading and memorizing he is all right, but on figures, or anything in that line, he is off.

Q. Have you a sufficient number of white children in the country to organize good schools?—A. Yes. We have very good schools over the country.

Q. What become of your white children when they grow up on the farm?—A. Most of them drift away from the farm. Some go to towns and hunt jobs, and things like that. We need them educated on different lines.

Q. Do the farm boys, after getting an education, remain on the farm, as a rule?—A. No; not if they can get off.

Q. Is there a good field for the intelligent farm boy to look after the farm?—A. There is not much room for them in the farming interests there. They can not see money enough in it; they want to drift out into something better. If a boy has any move in him he wants something better.

Q. Who does the work on the farm in your section of the State?—A. The darky and white man.

Q. What proportion of the whites work on the farm?—A. I reckon 25 per cent.

Q. How do the colored and white people compare in efficiency?—A. The white fellow that works for daily or monthly wages is no good. There is no more move in him than in the darky.

Q. He would not make a good farmer?—A. The majority of them would not. The negro feels like he wants to look up to somebody if he does much; if not, he is not going to do much. Take one of those fellows—the negro feels he is about as big a man as the white fellow.

Q. Twenty-five per cent, you say, of the work is done by the white man; is that about the proportion of the population?—A. I think not. There are more negroes, according to the population, that work on the farm than white people.

Q. Are the young white men able to manage improved farm machinery?—A. Some of them are. They are more apt to learn it.

Q. What class of labor-saving machinery do you use in your locality?—A. I do not use much of any kind.

Q. Do you sell farm machinery?—A. No; nothing more than wagons.

Q. You have drills for putting in your cotton?—A. Yes; we have what we call the cotton planter; we sell those.

Q. Do you have plows, and what kinds are they?—A. Well, all kinds of plows that we use.

Q. Do you have sulky plows for your cotton?—A. No; there are very few in our country.

Q. What kind of plows do you use?—A. Use the common Dixie and a common iron stock.

Q. And the single stock?—A. Single stock.

Q. You do not raise wheat enough to use binders, then?—A. Yes; they use some few.

Q. Are they satisfactory in their work?—A. I think so.

Mr. J. POPE BROWN (president of the Georgia State Agricultural Society). May I answer that question, Mr. Chairman?

The VICE-CHAIRMAN. Yes.

Mr. BROWN. We have some trouble with our white people. We have not been educated on that line. We are deficient in mechanical education. We have a few reapers and binders in our country, but when they get out of fix we do not know how to fix them. It was not very long ago that I heard a man speaking about a reaper and binder that was sent to his station, and there was not a man in the whole country that knew how to put it up. I saw a man that lost his oat crop last year because his reaper got out of fix, and while he was fixing it his oats fell down. We are very deficient in that kind of education. I used to have a lot of improved machinery, but I do not use much now. I cut all my oats with a cradle. I am deficient in it myself, and I have not anybody on my whole plantation that knows anything about it. If my machinery gets out of fix and I want it fixed, I must send away off to get a man to come and fix it, and he is very unreliable about getting there. We need that kind of education very greatly.

Representative BELL. Mr. Brown, is not labor at a cost of \$8 a month cheaper than machines?

Mr. BROWN. Well, I argue that, too. I say I can take my hands in the neighborhood there—for instance, I give my cradlers, as I figure it, \$1 a day and feed them. When I cut oats, if I have 100 acres of oats I want five or six men; if I have 200, I want to double up; and if I have 400, I double up, and keep doubling up.

Representative BELL. It is really cheaper, is it not, than the machinery?

Mr. BROWN. I am inclined to think it may be. After I count up the expense and the interest, the repairs, and wear and tear, I would just as soon have the negro cradlers. There is one thing about it—you can not cut it quite so clean, but I try to fix that this way: I let the hogs follow the cradlers, and they get what is left.

Representative BELL. It costs about \$1 an acre with a machine?

Mr. BROWN. I can cut it cheaper than that.

Q. (By Mr. A. L. HARRIS.) There is one crop, Mr. Lovejoy, that has not had much said about it, and that is the fruit crop.—A. (Mr. Lovejoy.) In some parts of Georgia they raise a great many peaches—a great deal of fruit. I think in our section we do not raise much fruit because our lands there, a great many of them, are not adapted to the fruit business.

Q. Do you raise enough for home consumption?—A. Yes.

Q. But not for export?—A. No.

Q. Many of our watermelons come from Georgia.—A. Well, they raise a great many watermelons down through there.

Q. Do you ship watermelons?—A. Oh, yes; but our experience in shipping watermelons is that we always have to pay the freight. They draw on us for the freight. We can not get anything out of it. The railroads knock us out, I think, and I can not understand why it is. It costs us twice as much to ship a barrel of Irish potatoes from our town to New York as it does to ship them from New York to our town. It costs us twice as much to ship them from our place as it does to ship them back.

Q. The railroads have a cheaper freight rate from New York?—A. I think it must be that way. If we could get the same freight rate out as we get in, we could make those industries pay.

Q. (By Representative BELL.) Is it your experience with railroads generally that discriminations are made in favor of great commercial centers?—A. Yes.

Q. Does that apply to manufacturing and everything else?—A. Yes.

Q. Do you believe that a country settlement can thrive while that system is in vogue?—A. I do not think so.

Q. Is it not your opinion that if the railroad rate bore equally upon every individual and every community, that instead of having great commercial centers like New York, Boston, and Chicago, there would be a great many good small towns in all portions of the country, to the great advantage of the body of the country?—A. I believe it would, yes.

Q. Have not your people in Georgia taken that into consideration in looking for a remedy for the stagnation of the country?—A. Yes; they have been looking into that.

Q. Have you some recommendation on that line as to railroad transportation—to equalize it?—A. If it were equalized, I think it would be a great benefit to the mass of the people.

Q. Do you believe the country can thrive until it is equalized?—A. No; I do not think so. The remedy for that I do not know—how to fix it.

Q. You say that the freight from your place to the New York market is just about half what it is from New York?—A. It is just about half from New York to our place what it is from our place to New York.

Q. Is that common to other great commercial centers as well as New York?—
A. I think it is in Georgia.

Q. Do you have in Georgia what are called common points?—A. Yes.

Q. (By Representative LIVINGSTON.) You call them competing points?—A. Yes; we have competing points.

Q. (By Representative BELL.) Sometimes charge you more to stop than they do to go on, do they not?—A. Yes; oh, yes. I had a steamboat man figuring with me the other day; wanted me to ship goods from the West through to Brunswick, and then he would bring them back on the boat for the same price that he would stop off at Hawkinsville.

Q. Do you think any country can thrive while that system prevails?—A. I do not think so.

Q. (By Mr. RATCHFORD.) Following that proposition out a little further, the testimony goes to show on this subject that intermediate points, smaller cities and towns, are discriminated against because of the advantages given to the great commercial centers by the transportation companies. If that be true, how do you account for the fact that during recent years of depression there was found in those great commercial centers larger numbers of unemployed and greater suffering and privation among the poorer class than was found elsewhere?—A. Well, the common laborer never got any more out of it; with all that, he did not get it.

Q. Do you mean to say that, take the city of Chicago, for instance, because of its peculiar location and its shipping advantages, the common laborer of the city is not more generally and more permanently employed than were those advantages not present?—A. Well, they could get the same employment at the same wages, and then distribute it more equally among the common people through the country.

Q. (By Representative BELL.) Do you believe it would improve his condition?—
A. Yes.

Q. (By Mr. RATCHFORD.) I want to know, if that particular city or section of the country be placed at an advantage over other sections, why he is suffering more there than he is elsewhere?—A. It must be his own way of managing, or else that he does not get out of it what he ought to have.

Q. (By Representative LIVINGSTON.) Is it not true that the lower strata of population drifts into these large centers, and that there is always a superabundance of them there?—A. Yes; I think that is true. You will find that a fellow comes to this country, or goes from the country to the city, quits his home, and will work there for less; throw that away just to be in the city, when he could go into the country and get a good job.

Q. (By Representative BELL.) Does the discrimination in favor of these great commercial centers have a tendency to aggregate a plethora of people there?—A. Yes.

Q. Necessarily?—A. I think it does.

Q. And then when business is stagnated they all turn up idle there in a body?—A. Yes.

Q. If they were distributed over the country would the whole country take care of them?—A. Yes; I think it would.

Q. Can you see any reason why it would not be to the advantage of the laboring people, generally, to have a better distribution of the manufacturing and shipping industries of the country?—A. I think it would be an advantage to them. It would get them out of such large cities. They would get out where there would not be so many of them in one body, and they could do better.

Q. (By Professor JOHNSON.) I would like to know whether we can not get at the cause of the difference in the rates out of your town, as contrasted with the rates into your town. Can you tell us whether you have competition, or more than one road in shipping from your place?—A. We have two roads, but they are under the same management. It is the Central and Southern system.

Q. They are under one management?—A. Well, they are not claimed to be, but we know they are; yes.

Q. Then you practically do not have competition?—A. Only our little boats there; they keep us in line when we can run them.

Q. Do the boats go direct to New York and Northern points?—A. No; they can carry them to Brunswick and there meet a line of steamers that carry them east or west.

Q. Then you do have some competition?—A. Yes.

Q. Do you know whether these two agencies, water and rail, compete against each other?—A. Yes; we have a line there that belongs to the city—a boat line; they keep it there for that business.

Q. Do you ever get lower rates because of that competition?—A. Yes.

Q. Still you say, in general, your rates are twice as much to New York as they are from New York?—A. From New York to our place they are cheaper than they are from our place to New York.

Q. Now, can you tell us whether the freight that comes to your town from New York, Boston, or Philadelphia is confined to one road, or whether that freight leaving those cities is adjusted between a larger number of roads?—A. They have it adjusted between the different roads, I guess.

Q. Then it is probably the competition at these great centers that gives you the low rate in, whereas the absence of competition accounts for the high rate out?—A. Yes. What I was trying to get at was that such a state of affairs kept our farmers back from raising products there, such as potatoes and things like that. They could not meet the market; the freight would keep them out—knock them out; they could not make anything out of it.

Q. Can you tell the commission how a consignment of watermelons from your town would reach Philadelphia, or any typical cargo from your town to any other Northern seaport town? Would it be shipped direct from your town on the bill of lading to Boston or New York or Philadelphia, or would it be shipped to some given shipping point and then billed to the point of destination?—A. I think they would bill it right through.

Q. Have you considered the best way to secure to your local town the rates that are secured by the large competitive centers?—A. I have always been interested in this. We ship more goods in than we do out.

Q. How do you think the United States Government, for instance, could give you the advantages which your town does not possess because of its physical situation?—A. I do not think they could do it. I think it is left with the railroads.

Q. Of course you would not advocate the fixing of the rates by the Government?—A. No; I do not think that would do it. I think that the commission looks after it, and that is about as good shape as you can get that in.

Q. (By Representative BELL.) Your commission can not look after that beyond your State line?—A. Is not there a national commission that looks after it?

WASHINGTON, D. C., June 21, 1899.

TESTIMONY OF MR. FRANKLIN DYE.

Secretary of the State Board of Agriculture of New Jersey.

The commission met at 10.55 a. m., Second Vice-Chairman Gardner presiding. Mr. Franklin Dye was sworn as a witness on the subject of agriculture. The topical plan of inquiry on agriculture was followed.

Q. (By Representative GARDNER.) You may state your name, residence, and occupation.—A. Franklin Dye; Trenton, N. J.; I am secretary of the State board of agriculture of New Jersey.

Q. How long have you been connected with the State board of agriculture and other agricultural organizations in New Jersey?—A. With the State board about 13 years.

Q. And previous to that time?—A. On the farm and connected with local farmers' organizations; farmer all my life until recently.

Q. Have you anything to say on the subject of the increase or decrease in number employed in agricultural labor in the several States during the past 50 years?—A. In New Jersey, with the increase of manufacturing interests, railroad building, etc., there has been a steady decrease in farm laborers, particularly of the native.

Q. And the cause of that; are there less acres tilled than in former times in New Jersey?—A. Do you mean that question as a cause for the decrease of laborers?

Q. Yes.—A. No; I do not think there is less acreage, but the manufacturing interests and railroad building and such other public enterprises have drawn the laborers away from the farm, in my judgment.

Q. They have drawn the laborers away from the farm, but if the acres are tilled it must require the labor to till them. What does machinery have to do with it?—A. Improved machinery has lightened labor; transferred the heavier portions to the horse. It has also decreased the demand for certain kinds of labor.

Q. Has the price for agricultural labor decreased in New Jersey, taking a long period together?—A. No; not taking a long period together. It is higher than it was at the time your inquiry starts here—40 to 50 years ago. I remember then men were hired by my father—the best of men—for \$150 a year and board. I would be glad to pay such a man \$300 now.

Q. That was true, was it not, at any time prior to the civil war?—A. Yes; I think so.

Q. Well, question 2, comparative condition of those so engaged.—A. That question is a little vague. If it refers to those who have left farm labor for some other, they are no better off; if to the condition of those now working on the farms, they are better off than were similar workmen 50 years ago. Hours are shorter and machinery has relieved them of the more trying parts of farm work.

Q. What is the comparative condition of those engaged in agricultural labor now and 25 years ago?—A. They are as well off, and I think better off, for the reasons I have suggested. They also have more of the conveniences and comforts of modern home life.

Q. Has there been a shortening of hours?—A. The hours are shortened very materially. The 10-hour system in the cities has had a tendency to compel that to a certain extent, particularly in the vicinity of the cities, where the whistle blows and they can hear it. Improved machinery has decreased the demand for certain kinds of work at certain periods of the year, as for men to do mowing and reaping during hay and grain harvesting. It has not decreased the price for labor.

Q. Under former conditions it was necessary to employ more men on the farm and for longer hours, was it not, during harvest time?—A. Yes; the neighborhood was scoured by the leading farmers for help; and it was usual to begin work on the farm before sunrise, if possible, and work on until very late. As to the causes of irregularity of employment, I will say: The general farmer does not require steady help, as he has little to do after the crops are gathered in the fall until the next season opens. With dairy farmers, workmen are required throughout the entire year. I think that is one cause of the irregularity of employment of the farm laborer. On the part of laboring men, most of such as are available for farm help now, there is an ever-present desire to see new places, try new employers and, perchance, strike a better bargain. The migratory character of farm labor decreases its efficiency. I think this cause of irregularity is twofold; not only caused by the character of the farm work, but caused by the character of the laborer himself—not willing to stay. I have had that experience right along with men on the farm.

Q. Is it true generally in New Jersey that farm labor migrates from the South in the spring that is determined to return in the fall?—A. To a certain extent, yes. There is more in the southern counties than in the northern. They are employing Southern help in Gloucester and surrounding counties, and they expect to go back. Farmers now must usually go to the cities and towns for extra help in busy seasons. Formerly this was to be had from among the owners of small farms and the poorer families whose sons and daughters were ever ready to earn a little money in this way. The latter were, as a rule, much more capable and efficient than the former. The native help that could then be hired was better than we can now pick up in the towns and cities; no question about that.

Q. Can you give the hours of labor in the different agricultural pursuits?—A. Farm help is usually expected to work "a day" whether hired by the year or by the day; but a day is much shorter on the farm than formerly, and few men will average 10 hours of solid work each day. I have often wished I could reduce to a method work on the farm so that we could have a system of hours. Some laborers have so many occasions to stop, loiter, and fool around, that they do not do 10 hours' work, usually.

Q. Do you know whether in New Jersey, generally, there is a difficulty in getting men to work on the farm in the most advantageous hours? In other words, if a man works on a farm 10 hours, does he or does he not insist upon putting in those 10 hours while the sun is up instead of at a time when it may be infinitely more advantageous to the crop, when a major part of it should be done outside of the hottest part of the day?—A. Yes; that is true. The 10 hours must be day hours.

Q. And is it not true that the system of putting in a "day" during the day is at times of very great disadvantage to the crop, particularly in dry, hot times like we have had this month of June?—A. That is true, and it is also true in haying and harvest time. By a little extra exertion—for instance, another half-hour's work in the evening might bring in a heavy load of hay, if the weather is threatening—but no, they must stop, and to-morrow that hay must be shaken out and

dried, and it will take a good part of the forenoon to get it ready to come in again. They ignore the advantage to the farmer, and to themselves even.

Q. It would be a very great advantage in many instances if the farm day were made from 6 to 11 and 2.30 to 7.30, would it not?—A. That is a question the farmers will have to meet. I will refer to that a little later. As to the average number of days employed in the year, that is difficult to come at, because some men are hired for the year and expect to work a whole year; others are hired for 9 months; others are hired by the day. Those who are hired for the year expect to work every day for the whole year, except holidays, usually.

Q. With your permission, we will pass to No. 8—"Tendency of agricultural labor to seek other employment; causes and remedies."—A. There is and has been a tendency to leave the farm and seek other employment. The causes, it occurs to me, are hope of larger and better wages and fewer hours per day and desire for social intercourse. The latter applies to the female members of the laboring man's family equally with the men. They desire to get together and spend the hours after 6 o'clock in social intercourse. The remedy—give steady or all-the-year work, equivalent to 10 hours, whether working early, as in the dairy, or late in the day, from any cause. There comes in your point of a minute ago, Mr. Gardner. It would seem necessary to divide it, and, where a man is in the dairy business, for example, and in harvesting and other work, to have a set of men ready to take the work up early in the morning and others who would be willing to work late in the evening, or else give them a longer interval in the middle of the day, when they can rest. For years I was in the dairy business and had to get up at 4 o'clock in the morning and get my milk off to the city, Sunday and week days, rain or shine. If you put a hired man on that work and expect him to work from 4 o'clock in the morning to 7 o'clock in the evening, he is not going to do it. He should not be expected to do it, unless he has extra pay. I do not know any other remedy than that.

Q. Do you think the character of the work causes a desire in young people to leave the farm, without regard to the number of hours or the pay?—A. Yes; there is such a feeling, I have no doubt. That obtains among farmers' sons who are leaving the farm and, it may be, to a certain extent among laboring men and particularly young men who want to get something that is a little cleaner and where they can be a little more "fixed up."

Q. And even more so, perhaps, among the young women?—A. I think so.

As to daily, weekly, monthly, or yearly payment: Few men would be able or willing to work for a whole year without receiving anything on account. It is largely a question of agreement. I believe there is a greater tendency among farmers to pay oftener than a few years ago—even weekly. This is to satisfy the demands and necessities of working men.

As to the maximum wages, and minimum: Where men board themselves, \$25 to \$30 a month, and usually a house and garden; where they are boarded, \$12 to \$18 per month, according to the character of the men—according to their ability to work. This includes lodging, and sometimes washing and mending. In harvest time \$2 to \$2.50 a day and board; ordinary farm work, 75 cents to \$1 a day, that is, for day work. Market gardening and truck farming and dairying command a little higher wages, I believe. I think that is about right.

Q. The store-order system does not prevail at all among your agriculturists, does it?—A. No. Sometimes farm produce—butter, flour, eggs, etc.—are taken in part payment.

Q. As to tenant houses and tenant-house allowances.—A. Tenant houses are falling down in many neighborhoods for want of use. They used to be fixtures of the farm, and men would stay all the year and work, but that is changing.

Q. How as to crop sharing, partnership, and tenancy?—A. Where farms are let "on shares," crops are divided as per agreement. This is strictly partnership farming. Where farms are rented, the tenant usually has full control, within the limitations of the agreement. He is sole proprietor of the farm and pays a money rent and certain privileges.

Q. The old method of crop sharing—A. I have tried that myself; it is not, as a rule, so satisfactory as tenant farming.

Q. Loans to tenants, liens on growing crops or prospective crops; extent of effect. The system of loans to tenants does not prevail in New Jersey, does it?—A. No; that is in the West, not here. As to the desirability of it—I think the history over there shows. In the middle West and in California, I believe, the banks will advance money and start a man on a farm. There seems to be a tendency on the part of the immigrant, especially, to start on a farm, and the bank advances him money. If he has good luck, he is all right; if he has a dry season, it is bad for him and bad for the bank.

Q. What is the character of immigration to the farm in New Jersey, or is there any of it?—A. We have. It is confined mostly to Hungarians, Swedes, and Germans. I think these, more than any other nationality, take to farm life.

Q. Character?—A. The moral character of the foreigner has to be discovered. The farm laborer of years ago was generally known. To-day he is usually a new man each year, and sometimes several times in a year.

Q. Are they settling in New Jersey and becoming proprietors?—A. Yes, they are doing that in proximity to our larger cities, around New York and Philadelphia; going into market gardening on a small scale. Of course you are familiar with the Jewish settlement in the southern part of the State; that is a colonization.

Q. (By Senator MALLORY.) What has been your observation as to their moral character, as a rule?—A. I think they improve as they settle and mingle with our people.

Q. When they first come in among your farmers in New Jersey, for the purpose of working on the farms, do you observe that there is any difference between them as a moral, quiet, and orderly people, and Americans, or any other nationality you have not mentioned?—A. Perhaps not generally, but, as I say, the character has to be discovered. They are strangers; we do not know them. They come and appear all right, but in some cases they are very disappointing.

Q. Nevertheless there is a comparison to be drawn probably. I understand you to say, that remains to be discovered hereafter?—A. I said their moral character would have to be discovered in each case. I do not know the character of these gentlemen present here. I presume they are all first-rate fellows, but if I got better acquainted with them I might find some faults, and they might find some in me. We may take a man on the farm who is a foreigner, a stranger, and from his daily work and appearances he seems to be all right.

Q. I am not speaking of those men that come to you to-day, but in the past, men of that class you have had experience with. How do they class as quiet, industrious people?—A. They compare favorably. Immigrants of 50, or even 40, years ago were a better addition to our population than are those of the present. It would be very much better, however, for a man to settle down to a business and become efficient in it. The farm needs such laborers to-day. I have had that very experience, and I know from the remarks of other men that farm labor is not efficient; and if these foreigners are going to take up farming in this country and will stick to it, it will be much better for them and for the farming interests. Manufacturers look for efficiency, and a man can not go into a factory and take up any certain line of work unless he knows it, and we ought to look for the same efficiency on the farm, but as a rule we do not get it. If a man can not get work at anything else he goes to the farm.

Q. And the farmer has to teach him what his duties are?—A. Has to teach him, and when he has learned he usually goes; very frequently goes.

Q. (By Representative GARDNER.) Percentage of literacy as compared with the American farmer?—A. I do not think we ought to compare them in the lump with our American-born people, laboring men if you choose. Some of them compare very favorably with our home people. The great majority, I think, are very illiterate. Foreigners coming to us now do not represent average European intelligence. They are peasants, coming from the lower strata of European society, and the illiteracy among our foreign-born population is 38 per cent greater than among the native whites.

Q. Is the tendency to colonize, manifest among these people, in your part of New Jersey?—A. Not outside of the Jewish settlements.

Q. Do you happen to know anything about it in the neighborhood of Hammon-ton?—A. Yes, I have been there, and have been to the Woodbine settlement.

Q. Is it true in New Jersey that wherever there has been an opportunity to get lands cheaply the Italian laborers brought in to pick fruit and do like things have begun to get hold of the land—have colonized and gone into that business and almost monopolized it in that locality?—A. I think that is true. Lands that were considered as barren a few years ago are being utilized and turned into productivity for these crops which you have indicated. We have several colonies in the southern part of the State—the Jewish settlement at Woodbine, as well as several others—and they are doing fairly well.

Q. Is it true that where the attempt has been made to colonize the foreigner in New Jersey systematically and with outside aid the progress has been less rapid than where these people have simply gone in themselves and colonized, by force of the circumstances, of their own desires?—A. I think, on general principles, that is true. I have not investigated it particularly. The fact of certain assistance all the time from outside sources will have a tendency usually to lead a man to comparative indolence. The system of colonization in general I do not think is best for the country.

Q. What I mean is this, more particularly: Where the Americans settle and start some particular sort of agriculture—as, for instance, fruit culture at Ham-monton—and they get it so far advanced that they get special railroad facilities, with their schools and churches and all that sort of thing, and they have to employ the foreign labor to help them pick and handle the stuff, in such case do the foreigners show a tendency to colonize and take the business they have come to assist with? And if that be true, is it true that they anywhere show a disposition to found a place of their own? Is it not the tendency always to take that which has already been created?—A. Yes; I do not know but there is such a tendency to create a similar industry of their own.

Q. (By Mr. FARQUHAR.) Do you know of the success or nonsuccess of the Jewish settlements in southern New Jersey?—A. In general, I may say they are succeeding. Their progress has been somewhat slow. They have had difficulties to contend with—very great difficulties—but I think they have overcome them.

Q. What was it mainly, agriculture or manufactures?—A. Chiefly agriculture. In Woodbine, for example, a man settles on 10 acres of ground, and to help him a little house is built, and provision is made for the cultivation of the ground and the growing of certain crops. The understanding is that if he is industrious and makes a little money that property will be his at a certain stipulated price in the near future.

Q. What county are they located in?—A. Cape May chiefly.

Q. What is the extent of lands that they settle on?—A. In the different colonies?

Q. Yes.—A. I could not tell you. Several hundred acres in each settlement, aggregating thousands of acres.

Q. You spoke of the transient help, foreign-born laborers and others; do you find usually among that class of immigrants men who have had experience in agriculture in the countries they came from?—A. It varies. We have some who have had experience in the countries they came from; the Swedes and Germans more, I think, than the Hungarians.

Q. Does that come from the fact that in Scandinavia there are more small farms than in any other nation in Europe?—A. It may be so. I have not thought of the cause of it at all. The German farmers are generally considered to be a thrifty people at home. They are industrious.

Q. Mainly, then, the foreign-born help in New Jersey are merely laborers without any experience in agriculture whatever?—A. No, I could not say that, except a certain per cent of them. I have in mind now Germans who came to our State years ago. They were industrious, worked for so much a month, and saved their money. There are scores of that kind of men. They own property now. They are good citizens. But I do not recollect any Hungarians of that class.

Q. Are there opportunities in New England or New Jersey for a foreigner who has some knowledge of agriculture and some means, to establish a little home there? Are the opportunities of your State of such character as to invite that class of immigration?—A. Yes, very emphatically; for the reason that our lands have decreased in value from former valuations, so that in numerous cases the properties can be bought for the value of the improvements on them. That is so throughout the whole State, and I know it is measurably true in New England also.

Q. What is the effect of immigration on American agriculture as to New Jersey?—A. It has been indirectly against it in the East. Unwarranted and unjust inducements to foreign immigration and the unfair (unfair to the people at large), almost gratuitous, disposal of our public lands, both to immigrants and railroad companies, has enormously increased agricultural productions. With this came, as a part of it, exceptionally low freight rates to the seaboard, and farmers in the older States have had to meet this competition. The result has been that for years they have grown some of their crops at a loss. Small wonder that the business has been dragging. Now, the effect of this immigration has not been, in New Jersey, directly apparent, but indirectly it has, because, as I say, the West has been taken up, and productions have been so enormously increased and brought to the seaboard at so low a freight rate that we were driven to the wall. It is a fact that a bushel of wheat in Dakota is just as near New York as a bushel in South New Jersey, so far as freight is concerned.

Q. (By Representative GARDNER.) Have you any suggestion as to the regulation of immigration?—A. Well, I suggest that, as we are just beginning to recover from this depression, the tide of immigration should be greatly restricted, at least for a time. There are enough laborers here now for our work and for years to come. Let these have it and the labor problem will soon settle itself. If any are admitted let them have intelligence and capital, so as to be a help and not a hindrance and burden to the State. Stop the opening up of new lands for at least

25 years to come, and, incidentally, irrigate no land, except for Government purposes, at public expense; let the States attend to that. All that will help.

Q. (By Mr. FARQUHAR.) Your test of immigration would be restrictive measures with reference to the character and education of the immigrant, and social standing, and to his having a sum of money to take care of himself?—A. Yes; I think that would be fair. It would be well to take care of our people. There are so many here now dependent on labor that it seems an injustice to bring others to compete with them.

Q. Under our treaty obligations with all foreign powers, how could the United States frame a law, unless they abrogated these treaties, to make these restrictions?—A. But you remember, no doubt, that, as I suggested, unwarranted inducements were thrown out right after the war. The railroad companies, when they got the public lands, put their agents on the Continent and advertised, and the steamship companies cooperated and brought these immigrants here, as you know, and our Western lands were taken up. We used to sing it as one of our popular songs. I remember a song on this subject of about forty years ago, the chorus of which was:

“Come along, come along—make no delay,
Come from every nation, come from every way;
Our lands, they are broad enough, don't be alarmed,
For Uncle Sam is rich enough to give us all a farm.”

Q. Colored labor—extent of.—A. In some localities that is on the increase. They come from the Southern States, and I think it would be well for both North and South if that could be encouraged, both for the housework and for the farm. It is a great trouble to get domestic help, as you know. Young girls will go in the store and work in the factory, but they won't work in the kitchen. If we can get these colored people from the South to go up there and work as they are represented to do in the South, it would be a great help. The majority of our help now is white, and mostly foreign.

Q. Do you know, or not, that as soon as you get the colored girl from the South to the Northern kitchen that she comes in contact with the colored people of the North, and inside of 2 months will be demanding more wages than the store girl gets in a great many cases?—A. Is not that true also of foreign help? You get one of any nationality and she will soon be initiated and demand a higher price. It is true, as you suggest, no doubt, about the colored girl from the South, and yet I have known of cases where they have worked steadily for 3 years, and then they must go South and see their friends.

Q. What have you to say as to the school age of children?—A. We run from 5 to 18 years in New Jersey; I believe that is the school age.

Q. What about the sufficiency of the public school facilities in New Jersey?—A. Any growing demand for increased facilities is usually promptly met; that is to say, we are trying to keep up with the demand.

Q. You do not think there is any lack of school facilities in the agricultural districts of New Jersey?—A. No, I do not.

Q. What is the percentage enrolled?—A. That I have not. I think, though, our school census takers usually get all of school age.

Q. (By Mr. RATCHFORD.) Do we understand that you have a compulsory education law in New Jersey—a truant law?—A. Yes. Under that law children between the ages of 7 and 12 years are obliged to go to school at least 20 weeks each year, but the law is not enforced as it might be, not to the letter.

Q. If it was enforced what would be the result?—A. They would have to go to school so many weeks in the year unless they were sick or were being taught elsewhere.

Q. Not during the full term?—A. No, I think not. I have not looked it up, but I think that while from 5 to 18 is the school age the compulsory feature does not go beyond 16. Sometimes the earnings of the children in the factory or some other industry overcome the law, and they do not get all the education they ought to have.

Q. (By Representative GARDNER.) The fact is, the compulsory education law is enforced by the local authorities in the different towns and cities in the State, and the rigor or laxity with which it is enforced depends largely upon local sentiment?—A. Yes, largely.

Q. In so far as you know, it is pretty generally enforced?—A. Not as well as it should be.

Q. As to the adaptation of the public school curriculum to the needs of the agricultural people, what have you to say?—A. The curriculum as now established in our public schools does not demand a knowledge of the principles of

agriculture on the part of the teacher. This makes it impossible for the pupil to secure training in those branches of knowledge so essential to his life work, if he expects to follow the farm. It would be a great gain were teachers qualified and required to give instruction in the elementary principles that underlie agricultural practice. Indeed, such knowledge would be of advantage to all pupils. We have had a committee from our State board of agriculture confer with the State board of education, calling attention to this fact. State normal school pupils who expect to become teachers are required to study chemistry to a certain extent, and botany, etc., yet the technical underlying principles of agriculture are not touched. Such knowledge would be of advantage to all, because we find there is a tendency on the part of nearly everybody who succeeds in nearly every other business to go back to the farm, and even city and town people have a yard, a garden, or a tree and want to know how to deal with them, and if these principles were taught somewhat in the school it would help them. Your question suggests a remark made by Prof. Austin E. Appgar. He said: "A pupil from one of the leading schools of this State recently came to enter the normal, and as she had studied and been graduated from the subject of botany, she wished to be excused from taking it again in our school. When questioned, she stated that they had never had a plant, or part of a plant, in the class during the whole course." Speaking to the State Board of Agriculture, he further said: "Insist that some of the time in your schools be devoted to nature and natural things. Insist that the plants, their organs and the office of these organs, are subjects as worthy of study as cube root and the purchase and sale of stocks. Insist that the education of the eye to see things and of the mind to comprehend these things is as important as parsing; that a portion of the time devoted to the study of the rivers of Africa be given to the study of the trees of your neighborhood; that the three great kingdoms of nature, animal, vegetable, and mineral, shall at least have a few periods of the school course devoted to their study."

Q. (By Mr. FARQUHAR.) Have you any agricultural or industrial college in the State of New Jersey?—A. We have an agricultural college at New Brunswick, under the Morrill Act.

Q. Is that exclusively an agricultural college, or what are the branches?—A. Agriculture and the mechanical arts; that is what the charter calls for. The pupils take a course in agriculture and the mechanical arts. In our State, of those who have graduated a very small per cent goes from the college to the farm. I understand in North Carolina a great majority, about 90 per cent, of their graduates return to the farm.

Q. Is it not the general opinion that these colleges and industrial schools have been the real foundation of bettering farming in America?—A. Yes; that is true. You know it was about 1840 that Liebig took up the question of agricultural chemistry. We had nitrogen, phosphoric acid, and potash, but did not know the value of either. Chemistry has taken hold of the agricultural question and discovered what each crop is in need of. And of course the agricultural colleges have taken up the work of Liebig and enlarged it, and by their bulletins have brought it down to the farmer, and if he will read and attend he can be benefited.

Q. Is it not a fact that the ignorance of chemistry of the soil and the rotation of crops is the cause of the impoverishment of the United States land to-day?—A. Knowledge of the chemistry of the soil, the plant food that is in the soil, and the requirements of the soil is essential knowledge. I have found that true in our intermediate West, in Illinois, in Iowa, and other States; continual growing of one crop, exhausts all the plant food in the soil that that crop requires and the yield is reduced.

Q. (By Representative GARDNER.) If agricultural chemistry had done what we claim for it and discovered the elements of plant food, so that we can return them to the soil, would not all the detrimental effects of continual cropping of one plant be overcome?—A. Laws and Gilbert have been carrying on such experiments in England, but generally that will not work. We have come to rotation as the better way.

Q. You do not think that is because we do not know what we are taking out?—A. We can discover that. The vigilant farmer, if he watches and finds that his crop of wheat, for example, is poorer this year and poorer next year, can discover that.

Q. (By Mr. FARQUHAR.) In the great prairies of the West the farmer knows that 20 to 25 years of farming has exhausted nearly half his soil proper, and his crops of to-day are just so much less than they have been in the old native soil.—A. Yes; they have been taking out the plant food and burning the fertilizing ingredients; have not utilized the straw, and have exported the wheat. If they had exported the flour and kept the bran and put it on the soil it would have

been different. They are waking up to that. Notwithstanding chemistry has discovered all this, the farmer has to get his money out of his crops to replenish his soil.

Q. (By Representative GARDNER.) Has any experiment been yet made that has demonstrated that nitrogen, phosphoric acid, and potash are the sum total of plant food?—A. Yes, these constitute the only essential fertility elements. The others are not liable to be exhausted.

Q. In other words, you would not want to say that we know enough about agricultural chemistry to enable us to keep a soil at its standard with fertilizer, with continuous cropping of the same thing?—A. I would not want to try it on a farm of mine. Would use some green crop for humus in connection with the fertilizer.

Q. We do not know what to put back yet?—A. We know what the plant needs, to a certain extent; not in every case.

Q. (By Mr. A. L. HARRIS.) What is the condition of your experiment station in New Jersey?—A. Its condition financially?

Q. Condition as to its usefulness to the farmer and developing the condition of the soil in different portions of the State?—A. We think it very valuable indeed. We believe we have one of the best corps of professors in the United States. Prof. Edward B. Voorhees is recognized as a very able man. They carry on in the different parts of the State every year certain experiments with farm crops, soils, and fertilizers, and demonstrate what is best for the locality. I have charge of the farmers' institutes, and I invite the professors to go to these institutes in the winter and give lectures on these subjects. The farmers question them, and by this means we get the information down to the farmers by the institutes and the bulletins, and we think the experiment stations of incalculable value to the farmers.

Q. Is it or is it not true that, after all, the experiments that are made on the farm as to what the soil will best produce are better than the laboratory?—A. The laboratory discovers principles. The farmer, knowing these, works more intelligently with his soil.

Q. Can you now, by any process of analysis, or in the laboratory, tell just how much phosphoric acid or ammonia there may be, suitable for plant food, in the soil?—A. The only way to ascertain that, as Professor Mapes has said, is to ask the soil questions; put several crops there with different proportions of different plant foods and see how they behave, and in an ordinarily favorable season you will see the trouble and can correct it.

Q. If you find you have too much straw and not enough grain you have the remedy?—A. Yes.

Q. If you find you have too much grain to the amount of straw and the grain falls, you know generally what to expect?—A. Yes.

Q. You have local experiment stations, all under the control of your general station?—A. Experiment farms. The farmers are cooperating with the professors in that way.

Q. You test the soil in all parts of your State?—A. Different parts each year. A soil analysis, as you suggest, will not always reveal what the crop wants. It is impracticable, because you may find a dozen different soils on as many acres. Soil analysis is hardly practicable; the other way is better.

Q. And the farmer, when he knows what is best to apply as a fertilizer, is then getting in the best condition to use his fertilizer most economically?—A. Yes.

Q. And until he reaches that point the application of fertilizer is an experiment and may be a loss?—A. May be a loss, largely through ignorance in its application or of its ingredients or availability.

Q. Have you a farm connected with your agricultural and mechanical college?—A. The college owns a farm, and the professor of agriculture lives on it, and they are carrying on now a series of experiments from year to year, which is highly edifying, and they invite the farmers of the State to come there and inspect what they are doing. I was there myself the other day. They have a very modern dairy, and it is more than self-supporting; the college does not give the professor any money to run it. He is making the farm self-supporting also and making some money, and it is not the best piece of land in the State by a good deal.

Q. Do the students to some extent perform the work on the farm under the eye of the professor?—A. To some extent; not so generally as would be desirable. They mostly simply go out and observe what is being done.

Q. Are there any inducements held out to the student to perform work on the farm?—A. I can not answer as to that; I am not posted. Prof. George H. Cook used to say that although young men did not go from the college to the farm,

that was no argument against this kind of education, and that in the final outcome many of these young men would come back to the farm.

Q. How about technical education?—A. It is on the increase, and should be encouraged. Summer schools of practical agriculture, horticulture, and dairying would be of great advantage, especially for city youth contemplating the ownership of a country home. Let them take a few months of the practical with the theoretical on the farms of leading farmers as opportunity offers. That is being done in New York. Mr. George E. Powell is inviting some of the millionaires' sons from the city to farm, and last summer some of the young ladies asked to come out and take lessons in horticulture on the farm. I wish we could have more of that kind of education. As to the total amount of capital employed in agricultural pursuits, we have in New Jersey 30,288 farms, with an average size of 86 acres; total value, \$159,262,840; live stock, according to the census, \$15,811,430; implements and machinery, \$7,378,644. I add to that \$1,500,000 for this fertilizer we are talking about (it approximates nearer \$2,000,000). That makes a total of \$183,952,914, which does not include labor. We are not largely a farming State, but those who are in it make a good showing.

Q. Earnings of capital compared with 40 years ago?—A. I do not think they are as much as 40 years ago. On earnings of capital invested in agriculture, compared with other lines of business—banking, manufacturing, railroading, mercantile, etc.—I have here a statement prepared by Dr. George H. Cook, which will give some light [reading]:

"In 1870 the capital invested in agricultural lands and implements in New Jersey was \$265,000,000, while that in manufactures and mining was only \$30,000,000; but the value of the products of agriculture was only \$46,000,000, while that of manufactures was \$169,000,000—more than three times greater. The manufacturer and speculator may turn his capital several times in a year, while the farmer expects to get back but a small portion of his each year.

"Invested in manufactories only in 1880 in New Jersey, \$106,336,593; paid in wages, \$46,083,045; value of material, \$165,285,779, making \$317,595,317. Value of products, \$254,380,236. Value of farms, fences, and buildings, \$190,895,833; implements and machinery, \$6,921,085, making \$197,816,918, or \$67,188,082 less than in 1870.

"Adding to this the value of live stock, \$14,861,412, and fertilizers used in 1879, \$1,001,009, gives us, invested in agriculture, in 1880, \$214,289,939. The estimated value of all farm productions was \$29,650,756.

"While the amount invested in manufacturing in 1880 had increased about one-third over that invested in 1870, leaving mining out of the estimate, the amount invested in agriculture during the same period had fallen off nearly \$15,000,000, and the productions from the smaller amount invested, \$16,349,244, being about 17½ per cent in 1870 against 13½ per cent in 1880. From these estimated productions must be taken interest on amount invested; cost of production, as hire, board of help and family, repairs, taxes, etc., which will leave a very low average per cent of actual profit."

It should be remarked that agriculture usually is the first to feel the depressing influence of unwise national legislation and of general financial crises, and if such depressing influences are long continued other business will finally feel the blighting effects against agriculture. They can not prosper long with agriculture depressed. And the fact needs to be emphasized that when business depression becomes general agriculture must first revive before there can be any general improvement. Our recent history shows this. Keep agriculture prosperous if you would have general prosperity.

As to the taxation of agricultural property, assessments are not uniform; assessors are in some cases a law unto themselves in fixing valuations. As to its "extent," as I understand the purport of that word, it is very general and comprehensive for most forms of property. Other forms of property sometimes evade or escape with a nominal assessment. Its effects are often burdensome because not equitable. A State board of taxation has been constituted by law in New Jersey at the instance of the State Board of Agriculture. It has done excellent work in unifying the methods of and basis of valuations for the assessors' guidance. It has arbitrary power to adjust assessments that, in their view, are unfair. A great need is to have a correct and uniform basis on which valuations shall be made. Farmers are required to pay taxes on certain forms of property over and over, as long as they live, that never earn anything. A young couple start in and get \$200 or \$300 worth of furniture, and if they live 40 years they are taxed forty times on that furniture. Our statute says tax all property at its full value; but who shall fix that value?

Q. (By Mr. KENNEDY.) Are you very much concerned about the subject of taxation in New Jersey? Is it not a fact that you are about to be relieved from

taxes by the enormous revenue flowing into your treasury as a result of the corporations being chartered by your State?—A. The taxpayer, except in a general way, does not have any access to that. A bill was passed last winter by the legislature, which will permit, after a certain amount, the turning over of any surplus—excess of that amount—to the counties to relieve them of their school tax. The only State tax we have is the school tax.

Q. Has this relief come to you on account of this revenue that I speak of?—A. This has gone on for several years. We could not have projected our big asylums, reformatories, armories, etc., without a State tax if it had not been for this income.

Q. Can you state what that income has been to the State of New Jersey?—A. The amount received by the State for the year 1897 from railroads and canals, less the amount allotted to taxing districts, was \$909,211, and from the tax on miscellaneous corporations \$380,941. This (1899) has been an exceptional year.

Q. (Senator MALLORY.) You say the school tax is the only State tax?—A. The only State tax.

Q. Do you have any bonded debt?—A. Yes; a remnant of our old civil-war debt of \$71,000. It is not payable until 1902; otherwise we could pay it now.

Q. This State board of taxation is taking up that question of fixing the valuations. Assessors have been a law unto themselves?—A. Some assessors have ignored the law and the decisions of the courts. The State board of taxation is compelling uniformity. If the taxpayers would take the matter up they would find the burdens and incongruities greatly relieved.

Q. Do you know how long it has been since New Jersey abolished all State taxes except for school purposes?—A. Since the adoption of the act of 1884, taxing railroads, canals, and imposing an annual license tax on miscellaneous corporations, the revenues from these sources have been sufficient to pay the running State expenses, without levying a State tax on private property.

Q. Have you any idea what the county tax and the school tax make—the percentage?—A. Although the State constitution requires that all property shall be assessed at true value, in most of the counties it is the practice of the assessors to assess at a percentage of true value, contrary to law. The average tax rate for 1897 in State was 1.78. In the urban counties where the assessment is based on an average of 60 per centum of true value, the tax rate is about \$2.13 per one hundred dollars' valuation. In the agricultural counties where property is assessed at true value, the average rate of taxation is \$1.26.

Q. What have you to say as to the causes and extent of migration of agriculturists?—A. The promise, often unrealized, of bettering their condition. Decline in prices of agricultural products is caused by overproduction and the other causes named, and also no systematic management by city authorities to see to it that all food supplies, especially quickly perishable articles, such as fruits, are regularly supplied or made accessible to the poor and laboring classes every day at a fair price. I do not know where the city authorities are taking hold of this question with a view of getting fruit and other perishable substances before the poorer classes, fresh and at a fair price. The hucksters regulate that, and when it reaches them it is frequently stale and hardly fit to eat. In the section of the very poor it seems to me our city authorities might do something. It would help farmers, too, very much. I do not think there is so much more produced than is needed; the fact is, it does not get to the people as quickly as it ought, and at a price at which they could purchase it. The price advances every time it changes hands.

Q. (By Mr. A. L. HARRIS.) Can you describe now the various channels that the garden truck, for instance, when it leaves the farm, goes through before it reaches the consumer, and what the cost is in each channel?—A. I can not. I know oftentimes cars are side tracked, and the products arrive in a partially damaged condition, and I have heard producers say it is impossible for them personally to get their goods before the consumers in certain cities because of the phalanx of middlemen, hucksters, and dealers who stand between them—some obstacle thrown in the way. I can not give you details. There is one other thing in that connection that I have no doubt indirectly plays a large and serious part in the declension of prices of farm products, and that is adulteration, and the consumer gets no benefit from it. The genuine article is adulterated with the cheaper, as you know, and the consumer pays the price of the genuine. That is what we are after in this pure-food movement. If an article may be adulterated, let us have it sold for just what it is, stamped just as our fertilizer bags are, and the consumer can buy intelligently.

Q. (By Senator MALLORY.) What article of New Jersey product is adulterated outside of butter—agricultural products proper?—A. Feeds are adulterated, bran, flour with meal, etc. Groceries are adulterated. Paris green is an article the farmers are complaining of this year; they get very little benefit from it; it is

very variable in quality. I do not say it is adulterated. I was speaking in the last sentence in a general way.

Q. (By Mr. A. L. HARRIS.) Your idea is that everything should be sold for what it is; if adulterated, it should be so branded; if it is marked "pure," it should be pure, and the person who sells it as pure should be held responsible for the purity?—A. Yes; that is right. There should be some means for redress.

Q. If you buy buckwheat flour, you do not want 25 per cent buckwheat, and 75 per cent some other kind?—A. If I buy buckwheat I do not want a certain proportion of fine indian meal or some other cheaper substance.

Q. Have you a pure-food law in New Jersey?—A. Yes; since 1881. It includes all foods and drinks used by man and all medicines.

Q. Have you an officer specially appointed to enforce your pure-food law?—A. That is in charge of the State board of health largely, aided by the State dairy commissioner, who is investigating the food products. He finds that a very large per cent are adulterated.

Q. Is his office at the capital?—A. Yes; in the State house.

Q. As to the decline in money value of agricultural lands in the older States; causes and extent.—A. The opening up of new lands with such enormous rapidity; sudden increase in the number of agricultural workers, from abroad largely; very low freight rates to the seaboard; farming for the cereals by wholesale by means of improved machinery on the Western plains, which was not possible there nor in the older States to such an extent without it—causes a low price for farm products, hence the farmers' sons in the East sought new fields of work and farm values declined even below the cost of buildings and improvements. The decline is general. As I said, we have just begun to recover from that condition of things, and I hope it will go on. That is my view.

Q. (By Senator MALLORY.) Is it not a fact that a thrifty, industrious, intelligent man can make a good living in New Jersey?—A. Yes; with a little capital. I would not be afraid to buy an average good farm with improvements if I could pay for half of what it cost. I could make my way nicely and pay for the farm at present prices; farms are so low.

Q. (By Mr. RATCHFORD.) That being the case, how do you account for the tendency of the farm laborer to go to the city? You say the young men on the farms are rapidly leaving them and going to the cities.—A. Mr. Gardner suggested it was cleaner work they were looking for in the city, but I think it is the promise, the hope, rather, of making money more rapidly in the city. The young man is after a sudden increase, and wants to get rich quick, and goes to the city; and coupled with that he has the idea that it is a little more respectable, and he goes to the city. Although he has an honest desire to improve his condition and to make money more rapidly than he can on the farm, it is largely sentimental.

Q. What, in your opinion, has been the experience of the young men who have gone from the farm to the city? Have they found it advantageous or otherwise?—A. We can answer only in a general way. We have statistics to the effect that not a very large per cent of those who go to the city with the expectation of making money succeed. They drag along in some clerical employment year after year.

Q. (By Representative GARDNER.) Is it true that there has been a steady decline in agricultural lands in New Jersey?—A. Yes.

Q. That decline has been due to the decline in the profits of agriculture?—A. Yes.

Q. Is not the hopeless outlook the source of the great influence on the young man who is growing up on the farm, if he sees it growing more hopeless and discouraging from day to day?—A. Yes. But there is another cause. If any of you have ever attended an agricultural meeting and heard a man lecture of stock raising, he has insisted upon the importance of heredity, of blood, of parental influence. Remember that some of the children of the last 25 years have been born in families where the hearts of the parents have been set against agriculture; they have come into life with hearts averse to agriculture, and the first thought is to run from it.

Q. There is a cause why the parents had an aversion?—A. Your answer comes in there, and the boy has taken up the same point.

Q. They have always had a hopeless impression?—A. Most of the crops were grown without much if any profit for a period of years.

Q. (By Mr. RATCHFORD.) The young man who stayed on the farm, according to your testimony, has fared better than the man who took his chances in the city?—A. In general he will fare better, in the outcome, I am sure. There are exceptional cases, of course. Some will go to the cities and succeed and some will stay on the farm and will not succeed.

Q. Just as it is true that the average of men who never gamble or speculate come out best; but the fact is that a few, one here and one there, make more or less money out of it.—A. The idea of the young man on the farm is the same as that of the young man everywhere.

Q. (By Mr. KENNEDY.) Is not that also accounted for by the fact, perhaps, of the desire of a large per cent of the men to become prominent in politics and statesmanship?—A. I do not know about that, although we have some prominent men who have gone into politics and become prominent there. I think few have left the farm for politics. This ambition has come later.

Q. (By Representative GARDNER.) You do not mean politics alone; you mean profession?—A. Yes; profession. Not politics alone.

Q. (By Mr. RATCHFORD.) Is it not a fact that the amusements of city life, and the allurements as well, which are so often portrayed to the farm boy, who is tired of his daily toil, weekly toil, and monthly toil—that that will have as great an influence in bringing him from the farm to the city as any other influence?—A. I have no doubt it has a very strong attraction. There is also the matter of social intercourse. It was to meet this that such business and social organizations as the grange were organized.

Q. Do you give it as your opinion that the greatest influences operating toward leading farm boys from the farm to the city are imaginary inducements?—A. Well, largely, bred of discontent.

“Decline in productive conditions of soil in said (older) States; causes and remedies.” This reached the first climax about 40 years ago. I remember when some of our best lands of to-day were turned out as “commons,” and were driven over. The plant food was gone and the farmer did not know how to get it back. Peaches came along and brought a little money, and marl was discovered. That brought clover, and clover improved the soil. Then came along these agricultural investigations we have been speaking of, and the tendency has been forward since in the better farming regions of the State. From that time on up to the recent depression, the productive capacity of our lands increased in New Jersey, and now we produce more wheat to the acre than any Western State.

Q. (By Representative GARDNER.) Why do you say not in south Jersey?—A. Those are sand regions, so far as I know. The production of wheat was 20.7 bushels per acre for the State in 1897.

Q. (By A. L. HARRIS.) Your average was higher than Ohio?—A. Higher than any Western State. I did not find it in California, because continual cropping with the same crop on the same soil has exhausted the plant food necessary to its production. Chemistry has revealed what constituents enter into the composition of the several crops, and what dairy cows and other domestic animals need for best results. This necessary plant food, nitrogen, phosphoric acid, and potash are provided commercially. Peru has provided nitrate, and all the clovers and other leguminous crops are grown by progressive farmers. That is the key, I think, to reclaiming all run-down soils in almost any part of the country where clover will grow, and where that would not grow we can try some other similar plant.

Q. (By Senator MALLORY.) Do you know what methods have been resorted to in central Europe for the purpose of preserving their soil from total destruction—soil which has been cultivated for hundreds of years, in Germany and France?—A. They were doing something a hundred years before chemistry was paying any attention to it. They depended on leguminous and root crops largely. German farmers live on little farms, and they have been very saving of manure. As Mark Twain says: “Their bank is their manure heap.” And they not only preserve the coarser part of it, but they have been very choice of the nitrogenous part—the liquid and urine. I have been told by progressive farmers that at the proper time—the spring of the year—they apply this to certain crops, and the effect has been most beneficial and helpful.

Q. Do you know if they save the drainage of the cities and transfer it back to the soil?—A. I do not know about the experiments. There is one going on in France, I think, to save the sewage of Paris, but as yet it is too expensive.

Q. Have you any calculation of the value of the garbage of the cities if taken back to the soil?—A. It would be immense. Anything that smells bad has generally the elements of manure in it, although stink is not essentially manure.

Q. (By Representative GARDNER.) All stink is not manure, but all manure stinks?—A. Not necessarily, although your question is to the point—if we could, by any means, save the city sewage and apply it generally to our soils, it would aid in rapidly restoring their fertility.

Q. Has not that been done in some of the small countries of Europe for a long period?—A. I can not state positively.

Q. What have you to say of the effects of increased acreage on productions, on prices, on profits, on wages, on employment?—A. Increased acreage lowers prices; that is, if you increase the acreage above the demand of the consumer, as has been done in certain lines, the increase destroys the profits; reduces the numbers of those who might otherwise be steadily employed. As for "bonanza" farming—in 1893 I was in California and passed up through the Sacramento Valley. There were supposed to be 15,000, 20,000, or 30,000 acres owned by one man, plowed, seeded, and harvested by the best improved machinery. Suppose this large property was divided up into 100-acre farms, the population would be increased and employment given to many people; roads would be improved; schools would be established.

Q. "Organization of agriculturists; causes inducing; objects sought; results secured; rules governing."—A. The causes inducing are, I think, in general, hopes of improving their condition. I know that to be the case—to increase the intelligence; to buy at wholesale prices by buying in large quantities. I know they are doing that in my State now, particularly in fertilizers and groceries. To cooperate in selling, and reduce the cost of transportation thereby, and to work together for the general improvement, with reference to roads, schools, taxation, social advantages, etc. These results are being secured and rules governing are fraternal, businesslike, and strict. In the neighborhood of Moorestown and in other localities they save several thousand dollars a year by buying fertilizers and mixing them themselves, instead of buying from the manufacturers of fertilizers. One object they have in view is to save money in that way. They also increase their intelligence. They have discussions and essays, and take, as I suggest, an interest in other matters and discuss them.

Q. (By Senator MALLORY.) On that point of roads: You have, I suppose, a system of public roads—aid for building roads in New Jersey?—A. Yes; we have, I might say, several systems. We have the old-time township system of appropriating money for the improvement or repairing of the public roads. There was a law passed a few years ago taking the management of these roads from overseers entirely and putting it in the hands of the town committee. Then we had special road acts; for instance, the Union County law, by which they could improve their roads, and prior to that Hudson County; but later the general road act for improving roads under a State-aid system was inaugurated.

Q. (By Representative GARDNER.) Please give an outline of that and what has been done with it.—A. The State board of agriculture has taken an active part in road improvements since organized 26 years ago. During Governor Abbott's administration we had a committee appointed from the board. They were then desirous of having improvements and of having the road laws codified, because they were so many and so intricate. In the discussion of the question in my office of what could be done, Mr. Conrow suggested that the State should help to build the roads. To bring this question before the people, I asked the executive committee of the State board whether they favored calling a State road convention, and they favored it, and for 3 successive years we had a State road convention, meeting right after the meeting of the State board of agriculture, and they were very enthusiastic meetings. It was surprising to find the interest that was manifested in the question. Just then this idea of State aid was advanced and the law formulated, and I think the first year \$75,000 was appropriated under Governor Abbott's administration. He wanted to restrict it to \$25,000, but we finally got it up to \$75,000. The first year of that system not much of that money was used. I think nearly \$40,000 or \$50,000 went back into the treasury. The farmers were afraid of it in many localities. They said it would be a burden to them if they had to pay for the building of a road and then keep it up afterwards. The next year the matter became more popular, and it has been growing in popularity ever since, so that the appropriation increased, I might say, to \$100,000 later, and last year to \$150,000 for this purpose. Under that law, if the parties living along any line of road want a stone road built by State aid they sign a petition to that effect, which, I believe, the law requires to be signed by two-thirds of the property owners.

Q. (By Senator MALLORY.) What distance?—A. Any distance.

Q. Suppose a road was 20 miles long; would it require two-thirds living along that 20-mile stretch?—A. Yes.

Q. Could they petition for a shorter road?—A. Oh, yes. I think a mile is the shortest. If the application is granted, they are to pay one-third the cost of the building of the road.

Q. The people who sign it, or the county?—A. The people owning property along the road; and the State pays one-third and the county one-third. Appraisers are appointed to fix the proportionate sum that each one of these property owners

should pay, constituting this one-third. After the road is built, laid down, and accepted, it becomes a county road.

Q. And to be cared for at county expense?—A. Yes.

Q. Then the road tax is mostly from counties, is it not?—A. Yes; for these roads. The freeholders report to the county board of assessors the sum required annually. This sum is included in the annual assessments, is collected and paid over to the county. We take township tax for ordinary roads, and there may be special tax for that purpose.

Q. Do you contract and let out repairs?—A. Yes.

Q. You have no county convict labor or anything of that kind?—A. No. The original act confined the material for the roads to stone macadam or telford, and the width and depth is a matter agreed upon largely by the property owners and road commissioners; but amendments have been made to the last law, allowing State aid for the building of roads with gravel, and also oyster shells, also bog ore.

Q. Have you any idea of what the cost in New Jersey per square yard is to build a stone road?—A. From 20 to 70 cents; a little more where the road bed is springy; less, if rock is mined near the road to be constructed.

Q. I suppose it is different in different parts of the State?—A. Yes.

Q. (By Representative GARDNER.) The decline in the value of agricultural lands in New Jersey seemed to be primarily caused by opening large areas in the West, did it not?—A. I think so.

Q. After that, New Jersey, lying directly between New York and Philadelphia, with the various considerable cities within it, became largely a trucking area, did it not?—A. Especially near the cities.

Q. So that the ordinary farming was displaced by truck farming. That used to be profitable, but now it is all gone; and where does that competition come from; do you know?—A. For early fruits and vegetables from the Southern States largely, for grain and meat—fat cattle—from the West, by reason of railroad facilities; but that is a matter we must face and meet.

Q. It is true, then, is it, that the transportation facilities from the South and West raise a competition that is destructive to the New Jersey farming?—A. Yes; to a certain extent. I spoke of the wheat a while ago, and the chairman suggested that they abandon wheat and go into truck farming. Of course, at particular times, the competition of the South strikes pretty heavy; other times it does not affect us much; so our gardeners and truck farmers try to run in between these times.

Q. Does that competition prevent the New Jersey farmer from getting the prices he used to get for his first fruits?—A. In general, yes. In various isolated cases he may get those big prices, but they do not stay long.

Q. Can he ever get them, only when he gets the first pease marketed? Have not Southern pease cut it down to standard level?—A. Yes.

Q. And that is an illustration of all other kinds of products; so that milk is about the only thing now that is free from competition from a long distance?—A. That is being overcome by refrigerated cars. Dairymen are not getting 2 cents a quart for their milk for the year. It does not pay at that price a profit such as should be derived from a business requiring so great an outlay of money, time, and labor.

Q. What can you say as to the present annual production in relation to consumption and existing markets?—A. I will simply answer that, in some lines, it is in excess of demand at paying prices.

Q. Overproduction in certain lines; underproduction in other lines; causes and remedies?—A. This occurs from various causes. Ignorance of market demands leads to excessive planting sometimes. Natural conditions unusually favorable, give a crop far above normal at times. Underproduction results from the same cause as first named, and also adverse weather conditions. Farmers should be better informed as to the world's annual requirements of the several crops, and carefully prepared reports as to acreages devoted to these crops in the different States should be given out each winter by the State boards of agriculture to their own States, as well as by the United States Department of Agriculture to the several State boards. A great aid to a correct knowledge on this subject would be to have our foreign consuls report as to production and consumption in foreign countries to the United States Department of Agriculture. I think that has been hinted at by somebody. If such information could be furnished and utilized by the Department of Agriculture, and put before the farmers, it would be helpful. In my judgment, it would be impossible to so regulate the acreage as to have an annual production just equal to the requirements of mankind, either locally or generally, exactly or anywhere near it. Suppose we do know just what we would need in the

United States, and how many acres would be required under natural conditions to produce it, and we plant so many acres, but there comes a drought we did not expect, the people would have to suffer. So, after all, our excess acreage may sometimes be a blessing in disguise to the consumer.

Diversification of agricultural industries; This would be helpful locally in some sections.

Effect of improved machinery on production and prices: Improved machinery has made possible ranch farming on a scale that was impossible before its advent, and hence enormous acreages have been brought into productivity. With an enormously increased acreage and increased crops, consequently lower prices followed. Anyone who has traveled over the Dakotas in the time of wheat harvest would be convinced of this. If we had to plow that in the old way, sow it by hand, and harvest it with the cradle it would never be done. Improved machinery has worked a revolution in that direction.

Q. That is in the West?—A. Yes; and in the East relatively.

Q. The farmer in the East, before the advent of machinery, in determining the acreage which he would cultivate each year was guided more by the amount that he could fertilize than by the difficulty of harvesting it, was he not?—A. Yes, and it depended on what he could take care of.

Q. Has the advent of the commercial fertilizer been a great agent in the increase of acreage and overproduction?—A. Yes; in a general way it has. It has brought up acres which were unproductive years ago. It has increased the product per acre very largely. Our wheat average in New Jersey a few years ago was 12 or 13. It has run up to 16 now, and 20. That has helped.

Q. As to "the extension of foreign markets—possibilities and methods?"—A. It is possible, and ought to be encouraged. Our consuls can help, as suggested. The Department of Agriculture can help by introducing our products abroad, and teaching foreigners their value by teaching them how to prepare them. Special agents should be sent to Asiatic countries to introduce our cereal products and extend their use, especially wheat. I remember a remark of President Hill, of the Great Northern Railway System, at St. Paul in 1897, that he believed it possible, without much effort, to introduce the use of our wheat flour in Asiatic countries, so that they would take all the surplus flour of the Pacific States without any trouble. They do not know what we have and do not know how to use it.

Under 42—"cost of production, including interest on capital, cost of labor, and other charges"—the cost of production is largely determined by the yield per acre for farm crops, or the yield per head for dairy animals, but other factors must be first considered, as value of land, expenditure for fertilizers, feeds, machinery, labor, marketing, etc. These vary somewhat in different crops and in different localities. I do not know how we are going to get at a general statement covering that question. We have got to consider those factors before we can get at the cost of production. It is a question, however, that every farmer should take hold of and endeavor to settle for himself. I think it lies frequently at the foundation of success or failure; he is working too much in the dark.

Increase or decrease in transportation during the past 50 years: There is much complaining as to what are claimed to be excessive freight rates. It is alleged that classification is so arranged as to beat the farmer; also that there is discrimination against the short haul and in favor of the long haul; also in favor of shippers in large consignments; but I can not give a comparison of rates. I have not that in my possession. I have not looked it up. These complaints are very prevalent.

Q. There is a general feeling of the New Jersey farmers that the arrangement of rates—long and short haul—discriminates against them and in favor of the farmer of Ohio, for instance, in the New York market?—A. I will not say Ohio, but I will say the long as against the short haul; and classification.

Q. Is not that complaint becoming specific against Ohio and northwestern New York, that country up there, as to milk?—A. Yes; it is in our State. Refrigerator cars made it possible. The peach growers, for example, in Hunterdon County—that section of the State where they produce in one county nearly 2,000,000 baskets a year—they began last year to pull up their orchards. They say, "The freight is so great we can not afford to grow peaches any more." The same thing occurred this year. Two or three years ago a gentleman who lived 22½ miles from Newark had a large peach crop, exceptional in his neighborhood. He had other peach growers, who had no crop, to cart his crop to Newark in wagons so as to avoid the necessity of sending by rail, and he claimed he got to market in less time than if he had sent them by railroad, and in better condition.

Q. Do you know the freight rate per hundred for that distance?—A. No; I do not. As I say, they are classified differently. Pears are light and they rate them

higher because they are more quickly perishable, so a higher rate is charged on them than on apples and potatoes.

Q. What is the effect of good roads on cost of local transportation?—A. Good roads affect those especially who are near enough to team their products to market and market them themselves. For soft or quickly perishable products this is a great gain. It will not pay, usually, to cart long distances, even on good roads, in competition with steam roads. Their supposed value is easily overestimated. I put that in merely as a hint.

Q. What have you to say as to combinations to control prices in local markets?—A. With the farmers in the East, especially those who grow small quantities of any one crop, it is difficult for them to combine to control prices. Indirectly, it might be done by organization to grade products so as to put on the market only that which is worthy, and sending to the best market each day. That is being done in California. I think the large proportion of their output of fruit which goes east is handled by the association, and the fruits are graded; hence they reach the Eastern market in a nice condition, uniform, and marketable shape.

As to the effect of the so-called grain and cotton gambling, they are usually constituted to aid their promoters; the cheaper they can buy the greater their profits. They are not organized to benefit the farmer primarily, nor yet the consumer. Their usual effect is supposed to be against the farmer's interest. The requirements of consumers will be best met by the supply on hand going direct from the producer without the intermeddling of crop gamblers. That is the general view. I have not looked into the matter of this grain gambling as much as some have.

Q. Have you investigated that subject so as to have any idea as to whether grain gambling does or does not affect the price of grain?—A. No; only in a general way; general impression.

Q. (By Mr. A. L. HARRIS.) It does not rob the producer of the general law of supply and demand?—A. Yes.

Q. After the producer has parted with his product, what further interest has he?—A. Suppose we have not a very large crop. The farmers are not usually posted as to the output of the country. It is presumed that a half dozen of us have posted ourselves. We send out our men and buy the bulk of the crop—all we can get of it—and put it in the elevators. Immediately the crop begins to advance in price. We brought all the influence we could to bear to make it raise.

Q. Suppose I have the financial ability to dump on the market a million bushels of wheat, when, in fact, I have not a bushel of wheat, what effect has that on the price?—A. The market does not know whether you have that wheat or not. Such sale is reported and the price. This has a tendency to fix prices lower than they would be had not a fictitious product been sold.

Q. Are the fictitious values and this booming of prices an advantage to the farmer himself in getting higher prices?—A. They do not always boom them.

Q. Is it a fact that even the bucket shops and curbstone brokers really contribute to the better prices rather than depressing the prices; and is not the object to keep up the prices rather than depress them?—A. There are bulls and bears on every market. If they keep up prices it is usually after the crop is under their control and largely out of the hands of the producer.

Q. The bear is found even in the real market, but as to the speculative market itself would you not say that the bulls are predominant?—A. Perhaps so. It is a question you want to look into very closely before you can give an answer; but the general impression is that this grain gambling works adversely both to the consumer and the producer. They put the price down to the producer and up to the consumer. That is the general belief.

Q. Please state whether, in your opinion, the dumping of large amounts of fictitious grain upon the market constantly does not affect the price, and whether it does not deprive the farmer of the benefit of the natural law of supply and demand.—A. In my judgment it does. If we could have the information as to crop yields placed in the hands of the farmers very approximately correct, they would have the matter in their own hands; they would know the product of the country for the year before, and the reports this year would show what the probable output would be this year, and no man would be able to hoodwink them, as if they had not this information.

Q. By what method could that be put in their hands?—A. By the present methods of the Department of Agriculture. Its correspondence is generally efficient and reliable.

Q. Have you studied them?—A. Somewhat.

Q. Is it almost always true that these bulletins, and especially those of the agricultural papers, exaggerate the estimate of every crop in advance?—A. Well, I

would not like to say that in reference to the Department of Agriculture. If they do, I think it would be an error in reporting rather than a willful exaggeration. But there is such a tendency.

Q. Is it not almost always true that the hard period is the period of maturity and every crop promises better than it yields?—A. It is frequently the case.

The next question is the legal regulation of trusts, combinations, and other forms of monopoly. That is a difficult question. I do not think any of us can question the right of men to consolidate their capital for the prosecution of great industries; in fact, it is necessary. We could not build our railroads or our suspension bridges, or carry on great enterprises of that kind without a consolidation of capital. We have touched upon that general question in the previous one. If they are going to consolidate their capital in order to monopolize the trade or to drive others out of the business, or crowd down the prices to the producer and enhance the price to the consumer, they ought to be regulated; that is, if you are able to find out in Congress a way to do it.

Q. (By Representative GARDNER.) Do you know of any farmers' organizations that would, upon investigation, prove to be trusts?—A. No; I do not.

Q. Do you happen to know anything about the organization of fruit growers—whatever you call it—in California? I ask because you spoke, a few minutes ago, about it.—A. That is not in the form of a trust, but it is to aid the producer to get his crop on the market in a marketable shape, and send it to market so it will command a good price. The individual producer in California could not ship his goods to the East unless he was a very large producer, and make it pay. It is only shipped by trainloads, and hence this horticultural society has conceived this plan. The stuff is crated and shipped to the East in a marketable shape, and only that which is supposed to be in demand. No; I do not know of any trust.

As to the operation of existing pure-food laws; objects sought; results secured; advisability of Federal legislation thereon; that we touched upon this morning. Where they are enforced they are beneficial. They seek, or should seek, to prevent the sale of poisonous or injurious foods, drinks, and condiments, and to prevent the sale of an article, adulterated to cheapness in cost of manufacture, as pure and at the price of the pure. All goods should be honestly labeled. One result would be the consumer would buy understandingly and would not pay a larger price for a cheaper article. It would seem necessary that Federal legislation should cooperate with State, the two working harmoniously to secure the one end—honest goods, honestly labeled, and sold accordingly.

As to the operation of existing Federal and State laws to prevent the spread of diseases among domestic animals; among plants; suggestions for the modification or extension of said laws; these, when judiciously enforced, are most helpful. Witness the eradication of pleuropneumonia. Other diseases now claim, and should have, immediate attention—tuberculosis, anthrax among hogs, etc. In this work, both for animal and plant diseases, best results will follow when the Federal and State authorities cooperate. I have no suggestions to make.

Q. (By Senator MALLORY.) Do those laborers who come there in a transient way have families, as a rule?—A. Some of them do.

Q. Are there any facilities for the children to go to school?—A. They have the same advantages that the other population have.

Q. What rule have you as to the residence of the child in the school district?—A. Simply as determining what school they belong to. For instance, a man comes into a certain district or township. He has children. It must be determined whether he is a resident there before they can be enrolled.

Q. Is his residence one of the conditions under which the child can attend school?—A. No. The law provides equal facilities for all alike; there is no discrimination.

Q. Suppose I should go there to spend 2 months this summer and want to send my children to school; would the fact that I was a nonresident, merely a transient visitor there, prevent my children from attending school?—A. Being a nonresident of the State your children could not draw any of the school money. By special arrangement with the school board they could attend school, you paying for their tuition.

Q. These transient farmers can send their children to school?—A. I never heard any objection.

Q. As I understand, the poorest farm laborers' children can have the same advantages as rich men's children?—A. They sit on the same bench and graduate in the same class frequently.

(Afterwards, on the 21st day of June, 1899, Mr. Franklin Dye, being present during the examination of another witness, and being asked for information upon certain topics, further testified as follows:)

Q. (By Representative GARDNER.) Will you state what, if any, efforts have been made to improve the market for milk, or any combination on that line?—A. I will say, in a general way, there was a movement started about a year ago by Mr. Myrick, editor of the American Agriculturalist, who took a very active part in organizing what he called the Five States Milk Association. It aimed to organize the milk producers in the five States contiguous to New York into a combination to control the output of milk, so that there would be no more put into the market than the day's demand in the city of New York.

Q. (By Representative LIVINGSTON.) Did that succeed?—A. They have not succeeded as yet. They have pledges from a large number of the farmers in the States named who have given a power of attorney to three or four men, which is a very doubtful course; but the thing has not matured and they have not realized, and I doubt if they ever will.

Q. What do they propose to do with the residue of the milk; make it into butter?—A. There would be a surplus, and they would use that at home; make it into butter perhaps.

Q. Did they establish agencies in New York?—A. They would do that if they could get the farmers to subscribe to this general plan and could hold them so they would not sell any beyond a certain amount; but it is doubtful whether it will succeed. A similar effort was made in Philadelphia a few years ago, and it petered out finally. The last legislature passed a law which goes into effect the 1st of November, that after that day cattle brought into the State must be examined and pass the tuberculosis test.

Q. I will ask you if it has not been established in New York that tuberculosis is contagious?—A. Medical men claim, I believe, that it is not contagious; and yet, if you put a tuberculous cow in the stall and two healthy animals on each side, the chances are the other animals will show the effects of the disease sooner or later.

Q. I believe it is held by the medical world that it is not contagious between man and man?—A. I will say that recently we went into a herd of 30 or 40 animals and took out 17 or 18 of them. We put them in the same stable, and they were there about 12 weeks. The man wanted them all tested, and some 8 or 10 of those calves were condemned and showed traces of tuberculosis. The first inference was that they had been nursed by a cow that was tuberculous; but one of the veterinarians, and I think his judgment is very wise, gave it as his view that this vitiated air was the cause of those calves taking the disease. It was very close, and they were there from their birth, not only taking milk which was contaminated, but breathing the air. Therefore I think his reasoning was correct.

WASHINGTON, D. C., June 21, 1899.

THE TESTIMONY OF MR. JOHN O. MAGIE,

Farmer, dairyman, and stock raiser, Elizabeth, N. J.

The commission met at 10.55 a. m., Second Vice-Chairman Gardner presiding. At 2.15 p. m. Mr. John O. Magie appeared and, being duly sworn, testified as follows:

Q. (By Representative GARDNER.) You may state your name and residence.—A. John O. Magie, Elizabeth, Union Township, N. J.

Q. What is your occupation?—A. Farmer, milk raiser, and raiser of thoroughbred stock.

Q. As to the condition of the dairy business in New Jersey—what do you say?—A. In sections of our State where we can retail the milk from our own wagons, it is done at a profit. Raising milk for New York City markets in our vicinity can be done at a loss only.

Q. Then, I understand, your milk can not be raised and sold to the milk dealer at a profit?—A. The New York milk dealer I spoke of. There are people in our township who raise milk and sell it for Elizabeth and Newark markets.

Q. Milk can not be produced in New Jersey for the wholesale market at a profit?—A. That is correct.

Q. But the dairy business may be profitable if the producer is his own retailer?—A. That is the fact.

Q. The dairy business is carried on in New Jersey very extensively, is it not?—A. It is.

Q. All the way from Sussex down to Salem and Cumberland counties?—A. Yes; the northern parts. In all the upper parts of the State they very largely ship their milk to New York.

Q. The development of the dairy business in New Jersey to its present extent is comparatively recent?—A. It is.

Q. At what period would you put it?—A. In our neighborhood we commenced selling milk about 1840; but that was then shipped to New York.

Q. What caused the New Jersey farmer to turn from the regular lines of agriculture pursued theretofore to dairy farming?—A. The West could undersell us on grain and all their products, as the carrying powers were increased to bring them to the people.

Q. The larger productions of the West and facilities for transportation reduced cereals.—A. Potatoes can be raised to an advantage now; we raise them in our county largely for the early market. After the potatoes will do to ship from New York State they can undersell us; at least, they can sell at prices that make it unprofitable for raisers in our section of the State.

Q. The only crop of potatoes marketable is the one you can market before they come in from New York?—A. Ordinarily. Some farmers keep them all winter for a fair return. Prices are generally best on early potatoes.

Q. How does the dairy business compare with what it was 10, 12, or 15 years ago?—A. Prices are a little lower and people demand better milk, put up in better shape. We are bottling milk mostly now.

Q. Is the competition by reason of transportation facilities growing in the dairy business?—A. Yes; competition all around us is growing. People who were formerly market gardeners are leaving it and are raising milk, for the reason that we are crowded out of the gardening market by Southern raisers.

Q. You are driven out of ordinary agriculture by the West, and the South, if I understand you, is crowding out the trucker?—A. Yes, largely so.

Q. So that milk is all that you have left?—A. That is somewhat so.

Q. And even in that conditions are becoming harder?—A. Yes.

Q. From what cause?—A. More are going into it; people are leaving trucking and going into it. Towns are growing up, but not as fast as the supply is increasing.

Q. What about refrigerator cars in transportation, or the equally low price for the long haul out of Orange County, etc.? What effect is that having?—A. That is having an effect in New York State, not with us. In our county we do not raise any milk for New York City.

Q. Is it affecting the dairy business generally in the State?—A. It is affecting shippers all over the State.

Q. What is your opinion as to the future prospect of the dairying business in New Jersey?—A. I think we have touched bottom; I think we are on the upward; in other words, there is a limit.

Q. You think conditions will become no worse; that you have reached the height of practicable competition?—A. That is my opinion. There are no statistics to prove it.

Q. (By Senator MALLORY.) What other business besides the production of milk have the dairymen of New Jersey? Do they produce anything else?—A. In some sections they are producing corn and hay to some extent.

Q. They farm as well as carry on the dairy business?—A. Yes; in some sections they are raising and feeding stock to some extent.

Q. Raising stock for sale?—A. Yes.

Q. What kind of stock—cattle and horses?—A. Cattle and sheep. Very few horses raised in our section; in some sections of the State a few horses.

Q. Does this class of people make butter as well as sell milk?—A. Some localities make butter, but selling milk is the general practice.

Q. Have you any cheese dairies in the State?—A. Not in our part of the State. I do not know of any.

Q. What is the average price of milk per quart for use in Elizabeth? What do you get there in your locality?—A. Seven cents a quart delivered. Within a year it was 8 cents. A year ago this last spring it was lower—from 8 to 7 cents at retail.

Q. Sold for consumption in New York, what would you get at your place?—A. About 2 cents would be the price. We formerly got that when we shipped to New York or sold to the man who did ship it.

Q. You sold to a middleman?—A. Yes.

Q. How far is your town of Elizabeth from Jersey City?—A. Thirteen miles.

Q. Is any milk made in your locality sold in Jersey City?—A. I do not know of any.

Q. You say you can not afford to ship to New York. Would that remark apply to Jersey City?—A. I should think it would, although I think Jersey City is largely supplied by dairymen near the city; but the New York supply comes from a distance.

Q. Were it not for the nearness of the city of Elizabeth, you would probably have much lower prices than 7 cents a quart?—A. Yes. Newark is 6 miles from us, and that is five or six times as large as Elizabeth, and of course there is a great deal of milk sold there, shipped in from Morris County largely.

Q. Have you any electric roads running into the country from these cities by which you can ship milk?—A. Nothing that can be used for shipping at present. They are agitating that question. I was up at Passaic a few months ago; we can go all the way there by electric roads, but there is no shipment of any produce being made.

Q. What is the average number of cattle that the dairymen of New Jersey keep on hand?—A. I am not posted on that. We are milking about 50 head—one of my sons and myself—on two farms.

Q. How many acres have you?—A. We are cultivating a little over 200 acres.

Q. Does that furnish pasturage during the summer for your stock—50 head?—A. It affords ordinarily fair pasturage. We have a great deal of young stock, 50 head, making 100 head in all; but this season being uncommonly dry we are feeding, of course; in fact, we expect to raise corn and feed dry feed the year round.

Q. You feed dry feed the year round?—A. Yes.

Q. What do you do for forage in winter?—A. Corn fodder, hay, cornstalks. We raise corn for the corn as well as the corn fodder alone.

Q. Are there any special diseases that trouble your cattle or cause them to deteriorate in your part of the country?—A. We are troubled in our section of the country sometimes with tuberculosis, and it is very detrimental to us that we have not a law to prohibit cattle being shipped into New Jersey without being tested for tuberculosis. Our legislature has not seen fit to pass a law that would prevent shippers of stock from dumping the stock upon us without being tested.

Q. Can you state what is the average yield of your milch cows in your dairy and the dairies similarly situated in your State?—A. We consider a very good cow one that will average 10 quarts for 365 days; seldom that we can get one.

Q. That is above the average, is it not?—A. Yes. There is a dairyman in our neighborhood that has done that, but it is seldom that any number will do it. He has a small dairy and has been a very practical man.

Q. Your dairymen, as a rule, pay some attention to the improvement of their stock?—A. As a rule, they do. In later years they have done a great deal on that line.

Q. Is there any particular breed of cattle that they prefer for dairy purposes in New Jersey?—A. The Ayrshires are very popular. Jerseys are wanted by those who sell cream. Guernseys are good.

Q. Do you have the full-blood Jerseys there for that purpose?—A. Yes.

Q. How do they stand the climate?—A. They stand the climate well. The trouble is to get those that will give milk enough to pay. It is very hard to get a Jersey herd that can be made to pay.

Q. (By Representative LIVINGSTON.) What amount of milk do you expect from a paying cow?—A. For selling milk you must get one that will average 6 or 7 quarts a day the year round, and very few Jerseys will do that.

Q. (By Senator MALLORY.) Do your dairymen raise cattle for the market?—A. Not as a rule; usually do not raise enough for their own use. That is the reason we can not get any law against tuberculosis. There are a great many fresh cows brought in for sale. Dealers in that stock and their friends do not want any hindrance put upon bringing in that stock.

Q. What portion of the dairymen raise beef cattle for sale?—A. There are no beef cattle raised in our vicinity and very few dairy cattle, and there is not one dairyman in a hundred who raises calves enough for his own use to keep up his dairy.

Q. I also understood you to say you raised sheep?—A. There are sheep raised in the State, but none in our vicinity. The first sheep I saw after leaving home was down near Trenton.

Q. Is that because you have no pasturage for them?—A. We have run into milk; and the dogs drove the sheep away.

Q. (By Representative LIVINGSTON.) Can you make more money off milk, butter, and cheese than you can off mutton and wool?—A. Yes; they can be shipped 1,000 or 2,000 miles about as cheaply as we can get them into the market.

Q. (By Representative GARDNER.) You have stated milk usually retails for 7 cents. What is it in Newark?—A. About the same. Some milk is sold down to 4, 5, or 6 cents.

Q. What is the retail price in New York?—A. Five to 8 cents. I think Mr. B. C. Seers told me he was getting 8 cents in New York for bottled milk shipped direct from his farm.

Q. What do you know about that combination of milk dealers in New York that absolutely regulates prices, and the farmer takes just what they elect to fix the price to be?—A. I know nothing about that, from the fact that I have had nothing to do with them; we have sharp competition right around us.

Q. You know as a fact that the wholesale price is 2 cents a quart and the retail price in the New York market is 7?—A. That is the highest retail price for the best goods. There is, as I said, milk sold for 4 cents.

Q. What does it retail out of the can for—not bottled milk, not something fancy?—A. Seven cents from the can.

Q. The difference between the wholesale and the retail price is 5 cents?—A. Yes.

Q. (By Senator MALLORY.) Can you undertake to say what is the average number of milch cows on the dairy farms in New Jersey?—A. I could not say.

Q. What number of milk-giving cows would be the least that you think a man ought to undertake to carry on this business with?—A. There are people in our vicinity who have started with one or two and grown to a good business.

Q. He must have land?—A. Many have only a city lot or one or two city lots.

Q. How about the grazing of these cattle?—A. He would keep them on the commons about the cities, and in a stable and feed.

Q. In the country where there are no commons?—A. In the country people ordinarily are occupying farms, and have pastures to keep them on; expect to have some pasture and utilize ground feed and dry feed as well.

Q. (By Representative LIVINGSTON.) Did you ever try a combination of the milk producers against those New York people; did you ever try a milk combine on them?—A. We never have.

Q. (By Representative GARDNER.) Is there any statement you would like to make on any matter you think important?—A. In the matter of labor, farm laborers are receiving more in our vicinity than they did 30, 40, or 50 years ago. Competent farm laborers are receiving more, and their hours are shorter than formerly. Of course, in the dairy business we have to make long hours, but they are shorter than they were some years ago.

Q. (By Representative LIVINGSTON.) What are your dairy hours?—A. From 4 o'clock in the morning until—we are trying to make it 6 in the evening. We run over that in some seasons.

Q. What are the wages?—A. From \$12 to \$20 a month and board, or \$30 or \$35 and house rent for competent men.

Q. You mean you pay that money to what you call competent labor?—A. Competent.

Q. You do not take indiscriminate labor and pay those wages?—A. We usually pay \$12 to \$20 and their board, not indiscriminate. They must be good, competent men for \$20 a month, men that are not only good milkers, but good farmers, as it were—teamsters.

Q. (By Mr. A. L. HARRIS.) Do you know whether an independent producer could establish himself and sell his milk in New York?—A. My impression is that he could, although some men that have had abundant means behind them have abandoned it, and that recently. There was the Havemeyer estate that sold their stock at auction a year ago last month. Mr. Meyer, the son-in-law, who carried it on, said he could not realize off his milk. He had a dairy store in New York where they were selling gilt-edge milk, and he said he could not realize enough for it to pay his bills.

Q. Did he assign a cause for not being able to?—A. Competition. Prices were reduced. They used to get 12 cents a quart for Jersey milk put up nicely, shipped in ice refrigerator cars and kept on ice; but the price was so reduced that he abandoned it.

Q. You are not aware of any combination?—A. No combination that I am aware of in that line.

Q. (By Representative GARDNER.) Do not they have a milk dealers' association in New York?—A. They have. Of course, that is the foundation of it, but there have been a good many independent dairies that have shipped their milk in in bottles. Up at Fairfield there is a dairyman who has—I saw it published not long ago—385 cows. They are shipping their milk to Newark or, rather, they are carting it there, through the Oranges, and selling it and retailing it about, and they are doing a large business. Whether it is actually profitable or not I am unable to say.

Q. You do not know whether, if an independent milk dealer starts in to get a

route in New York—whether the milk dealers' association put down prices on that route to drive him out or not?—A. I have heard it said they have done that, but from my own knowledge I could not say positively.

Q. It is the understanding, is it not, that they do that?—A. It is so understood.

Q. (By Mr. A. L. HARRIS.) You say the milk you ship to New York you get 2 cents a quart?—A. That is the summer price, as I see from the papers.

Q. And it is sold at 7 cents a quart—who gets the benefit of the 5 cents?—A. The New York wholesale dealers, as they are termed; the middlemen.

Q. (By Representative GARDNER.) One-half cent a quart, 20 cents a can, goes as freight?—A. Yes.

Q. (By Mr. A. L. HARRIS.) How many hands does that pass through before it reaches the consumer?—A. These middlemen would have the milkmen come to Jersey City, where the cars land it, or New York depot where it lands, and load their milk, take it where they want it; that would be the practice. There are wholesale men in Newark who have their wagons drive through the upper part of Sussex County and Morris County and come back loaded with milk.

Q. In your opinion, who makes the greatest profit from the milk, the producer or the middleman?—A. The middleman.

Q. (By Mr. FARQUHAR.) Is not the profit of the middleman in milk divided between the two? Are there not two parties to it?—A. Yes.

Q. First of all, there is the man who pays the freight and receives it, and then it is scattered out to what are commonly called the peddlers?—A. Milk peddlers.

Q. These peddlers must keep their own horses and drivers, and collect their money, and everything of that kind, and also they furnish the small retail stores all over with their milk?—A. Yes.

Q. These parties all have a profit?—A. Yes.

Q. Now, can you give us an idea about what that average is to a man with horses and wagons; that is, considering the keep of the horses and the hire of the men, for instance, for a day in New York?—A. I can not, correctly.

Q. Independent of the freight, that is 4½ cents to divide, and I suppose there is 1 cent given to the man who has the sending out there in New York, and there is 3½ cents to divide; and that is all there is between the consumer and the man who first of all gets his cans on the wagon and does the whole distribution and the whole collection, and keeps his horses, and at the same time takes care of all this?—A. Yes.

Q. (By Representative GARDNER.) Do you state the fact under oath that there are two of the wholesale men in New York? In Philadelphia the wholesale man generally has his own wagons and serves his own several milk routes. He does not sell it to the peddler.—A. No, he owns the wagons; he owns the horses; and he serves the milk routes.

Q. George Abbott has a third of Philadelphia, has he not?—A. Yes.

WASHINGTON, D. C., June 22, 1899.

TESTIMONY OF MR. JOSEPH B. AGER,

Master of the State Grange of Maryland.

The commission met at 10.50 a. m., Mr. A. L. Harris presiding. Mr. Joseph B. Ager, Master of the State Grange of Maryland, being duly sworn, testified, following the topical plan of inquiry on agriculture.

Q. (By Mr. A. L. HARRIS.) State your name and address?—A. Joseph B. Ager, Hyattsville, Md.

Q. You may state your occupation.—A. Farmer and dairyman. Principal business is dairying.

Q. How long have you been engaged in dairying?—A. Twenty years on the 1st of last May; in Maryland.

Q. How largely are you engaged in the business?—A. I keep from 40 to 50 cows.

Q. Where do you market your dairy product?—A. Washington.

Q. In the shape of milk, butter, etc.?—A. Milk and cream.

Q. You do not manufacture butter or cheese?—A. No.

Q. Has there been an increase or decrease in the agricultural labor of your State or vicinity in the last 30 to 40 years?—A. Throughout the State there has been a

decided decrease, from the fact that 40 years ago there was a great deal more land under cultivation than there is at the present time. There are a good many farms and plantations, cultivated at that time, which are not cultivated at all now, and a great deal has grown up in timber. Along the lines of railroad many farms have been subdivided into small town sites. Small towns have grown up along these lines. I should say there has been a decided decrease in the number employed.

Q. What is the condition of those employed compared with former years?—A. They are not in as good condition as they were at that time, although there are exceptions. In every locality you will find thriving industrious farmers making money, but the average condition, I should say, was below what it was 40 years ago.

Q. What effect, if any, has improved machinery had upon the advance or decrease?—A. It has a tendency to decrease, from the fact that with improved machinery farmers do not require the amount of labor they did before. During the harvest, where we used to have 5 or 6 men, 1 or 2 answer now with improved machinery. Self-binders, mowing machines, hay loaders, and horse pitchforks do away with a great deal of labor.

Q. What effect does that have on the drudgery of labor?—A. It makes it much lighter. With machinery a great deal is done riding that used to be done walking.

Q. Is employment regular or irregular in your State?—A. That depends a good deal upon the employee. Our labor is mostly colored, and during the summer season, when they can get employment most anywhere, we can hardly ever keep them more than a month. I would be glad to keep a good hand right along, but they flock away to the city, and when they can get work it is for shorter hours and larger pay. The employees themselves are the cause of the irregularity largely.

Q. What are the hours of labor in your business?—A. Generally from 4 or 5 o'clock in the morning to 7 or 8 at night—long days. I once heard one of our public speakers say that the farmers had settled the 8-hour question by having 8 hours before dinner and 8 after.

Q. What are the hours of labor in other agricultural pursuits outside of dairying?—A. About the same.

Q. What have you to say about the average number of days the laborer is employed?—A. In dairying it is 365 days in the year, and in other occupations there is not as much employment in winter. In our neighborhood it is largely according to contract. They keep some labor during the winter, but not as much as during the growing season.

Q. What, if any, is the tendency of agricultural labor to seek other employment?—A. They will seek other employment when they can get less hours of work and better pay.

Q. Does that prevail to any great extent?—A. Yes; quite a great deal, especially in this season. There is a great deal of work going on in this city, and the best labor flocks into the city.

Q. A great deal of labor?—A. There is more this season than for several years.

Q. (By Mr. FARQUHAR.) What are the wages prevailing for agricultural labor by the day, month, or year?—A. We usually hire very little by the year. It is usually by the week, day, or month. Ten dollars a month would be the minimum and \$15 the maximum amount. They are boarded at these prices. Seventy five cents and \$1 a day when they board themselves.

Q. When they come to Washington and get \$1, \$1.25, and \$1.50 a day they care for themselves?—A. Yes.

Q. (By Mr. A. L. HARRIS.) What is the cause of the difference between the maximum of \$15 and the minimum of \$10?—A. Well, often in the season of the year, and then in the difference in help. Some men are better worth \$15 than others are \$10.

Q. Do you pay in cash?—A. Yes.

Q. How frequently do you pay?—A. Those employed by the week we pay by the week; those employed by the month expect to be paid by the month, but they almost always want more or less every week.

Q. What have you to say in regard to tenement houses?—A. Most farmers have them, more or less. I have three tenements on my place.

Q. You may state the terms upon which the occupiers of your tenement houses work for you.—A. I have the houses with the view of having my own help in them. I thought I would have more reliable help, but I find I was mistaken in that. In fact, of the tenants of the three houses I have not one is employed on the place. They go outside and go to somebody else.

Q. Describe the houses.—A. Usually small, perhaps three rooms; about the general size of that.

Q. Of what are they constructed?—A. Usually frame, lath, and plaster; quite a comfortable house, but small.

Q. What appurtenances go with the houses?—A. Generally a garden spot, perhaps a quarter of an acre of ground. That is more than most of them will cultivate.

Q. Is that all free?—A. Yes. I charge \$4 a month rent and they have the use of the garden spot and such down fuel as they may pick up about the place.

Q. When you furnish the tenant house with a garden spot and hire 'he help and charge \$4 a month rent, how much do you pay?—A. We pay about \$15 a month.

Q. Does he board himself?—A. No; he is boarded.

Q. (By Mr. FARQUHAR.) Is it in the form of rations?—A. No. That used to be the custom years ago, but not at present very much.

Q. (By Mr. A. L. HARRIS.) What does he raise on that garden spot?—A. A few garden vegetables, potatoes, and corn, and possibly some watermelons.

Q. Can he raise sufficient vegetables to support his family?—A. They do not do it. Some classes of tenants, like the Germans in the West, on a piece of that size, would raise enough to support themselves, but the colored tenant hardly will use the ground you give him.

Q. What time, if any, do you give your tenants to till this?—A. We usually plow it for them and they work it at night or early in the morning. Their wives often do some of it; generally do more of it than the men.

Q. You do not give them so many hours a week to take care of it?—A. No.

Q. (By Mr. FARQUHAR.) Do you give them any time on Saturday, as is given in the South—about 3 or 4 hours Saturday afternoon?—A. Not as a general thing. We aim to get through the work a little earlier on Saturday night than other times; but it is owing to the condition of the work we have on hand.

Q. That would drive the tenant to the cultivation of his garden spot on Sunday?—A. It would if he took much pride in cultivating it.

Q. Do they put in any Sunday work on that garden?—A. No.

Q. Do you rent any of your land?—A. No.

Q. Is that practiced?—A. It is in some localities.

Q. You may state on what terms.—A. That depends a great deal on the condition of the farm, locations, etc.

Q. Is that cash rent or crop sharing?—A. More apt to share crops; do it in southern Maryland. I know one gentleman who furnishes everything and he gives the tenant one-third of what is sold off from the place. In other localities, where land is in better condition and they raise better crops, they furnish usually one-half the seed and give one-half the crop.

Q. Have you an opinion as to the practicability of that method of renting, both for the tenant and landowner?—A. Well, I do not think, as a general thing, it is very desirable for the owner; in fact, it is very difficult to get men to rent a farm who have sufficient energy to work it as it should be. It is very hard to get work done at the proper time and in the proper manner, from the fact that the man who is industrious enough to rent a farm, and work it as it should be done, usually has a farm of his own. Owing to the cheapness of land in Maryland, a man with much ambition or much energy is able to have land of his own and not rent land.

Q. Do you practice loaning to your tenants who cultivate your land?—A. In some localities they do. Sometimes they get short of grain, etc., and the owner perhaps will sell them the grain at the market price, and then when the crop is harvested he returns the grain at the then market price.

Q. I am anxious to know whether you have any general way of doing that?—A. No, I think not.

Q. Does not prevail to any extent?—A. No.

Q. You have nothing in the nature of liens on crops?—A. No. As far as Maryland is concerned, especially in the southern part, where they grow tobacco, which is a crop that does not bring in money frequently, they go to Baltimore and obtain supplies from the merchants there, and I presume they take a lien on the crop. They obtain their fertilizers and necessary provisions, and so on, and when they sell the tobacco they settle with the merchants. That business is done more with the merchant than with the owner of the farm.

Q. Not done by the local merchants?—A. No. Generally done by the men in Baltimore.

Q. (By Mr. A. L. HARRIS.) To what extent is that done?—A. Quite largely, I should judge, through southern Maryland and other localities where they grow tobacco.

Q. What is the effect on the tenant?—A. I think it has a depressing effect. He would be better off and more thrifty if he were able to pay cash for what he bought and then have his crop left.

Q. Do you know anything about the terms on which these advances are made?—A. No; I do not.

Q. Have you any immigrants in that locality?—A. Very few; they are mostly Germans.

Q. What is the character of those you have?—A. Those we have are very good immigrants. I think Germans are about the best class of immigrants we have. They are generally thrifty and industrious. I have known them to come and go out to work on a farm as laborers and in a few years have land of their own.

Q. Do they make good citizens?—A. Make good citizens.

Q. (By Mr. FARQUHAR.) These were men of experience in farming before they came here?—A. Undoubtedly.

Q. Do those immigrants there settle on farms or small property near the cities?—A. Generally about cities, and engage in trucking. It requires less capital. With a few acres and an old horse or two they can go to trucking, and it does not require the capital that it does to buy a larger tract and go into general farming, stock raising, etc.

Q. Is there much truck farming in Maryland?—A. A great deal near Washington and Baltimore. In Baltimore County and Prince George County there is a great deal of it done.

Q. Is truck farming a paying business?—A. It formerly was very profitable; especially if a man understands how to maintain the fertility of the land and grow the best crops. Some have greenhouses, where they grow winter crops; that is quite profitable. But many of them complain that they can not any more than make both ends meet.

Q. Is there ready access in the cities to manure and other crop fertilizers; is it cheap in the city?—A. Not so very cheap, considering the comparative value.

Q. What is the price in your locality?—A. They charge about 75 cents to \$1 for a 2-horse load in the city, and haul it out, but since they have got the improved stables here, where the liquid portion goes into the sewer, about all they get is dirty straw, and that is not very valuable. I believe if the gardeners would work less land and try to enrich their land with clover, cowpeas, and other leguminous crops they would have more money at the end of the year than in hauling so much manure. I think Professor Voorhees, of the New Jersey experiment station, said that the average ton of horse manure has not over 28 pounds of plant food in it, and when you pay \$1 a load and haul it out you are paying a pretty good price.

Q. (By Mr. A. L. HARRIS.) What effect on American agriculture have the Germans you spoke of; is the effect to improve or lessen the condition of the agriculturist?—A. It has improved the condition. They certainly set us good examples in everything. They are industrious and economical and some are our best citizens. One of the leading men in our neighborhood is a German, a man who has accumulated quite a good property through industry and economy.

Q. Would you suggest any changes in our present laws in regard to immigration?—A. I think you have stringent laws against importing criminals and paupers.

Q. I had more reference to encouraging good citizens?—A. I think there is a grand opening for immigrants from foreign countries in portions of the North and West and in Maryland. There is land lying between this city and Baltimore as fine as ever lay out doors, and all it needs is intelligent cultivation to make it produce, and they can have a home market for all they can produce.

Q. Have you a large amount of colored labor?—A. Nearly all colored labor.

Q. What is the efficiency of your labor?—A. Some of them very good, but as a general thing you have to have some one right with them to superintend and see that they do the work properly.

Q. Do they become intelligent hands after experience?—A. Not very many of them. There are very few whom you can trust to go on and do a piece of work properly unless you have a foreman right with them.

Q. You do not consider colored help as valuable as white help?—A. It depends on the kind of white help. The white help in the South is not much better than the colored, but the German, Dane, and Norwegian are different. I lived for 25 years in Wisconsin, and although we paid them higher wages it was cheaper help than we hire here.

Q. Do the colored help improve by experience on the farm?—A. Not very much.

Q. Do they take to farming as a matter of taste?—A. I think not. I think they would rather come to the city here and black boots than work on the farm.

Q. What is the school age of children?—A. Six years to, I suppose, about 20.

Q. Are the facilities for public instruction in your State sufficient?—A. I think they are for the white, but I think there should be more schools for the colored. I think there is a lack of schools for colored children.

Q. You may state the difference in the facilities for educating the white and the facilities for educating the colored children?—A. As a general thing they look after the schools for the white better than the colored, but I think, perhaps, they have good teachers. There is one thing about it: I can say for the colored children that many of them are more anxious to get an education and go a longer distance to get it than the whites.

Q. You have separate schools and separate teachers.—A. Oh, yes.

Q. What is the condition of your schoolhouses, as a rule, for both white and black?—A. As a general thing, good.

Q. And your teachers?—A. Very good teachers. They have to be qualified and have a good grade. Many of them are graduates of normal schools.

Q. Have you any compulsory law?—A. I think not.

Q. What is the average attendance, if you know, in the year?—A. I could not say, only so far as our district is concerned; that averages about 40. We have to have that average in order to have it a graded school.

Q. What is the average enrollment?—A. I think about 50 in our district.

Q. Have you free schoolbooks?—A. Yes; furnished by the State; a law passed, I think, by the last legislature.

Q. Do you have any truant law?—A. No.

Q. You feel the adaptation of your public school curriculum is equal to the wants of the agricultural people, do you?—A. No; I do not. I think agriculture should be taught in our schools—nature studies.

Q. You may state in a general way what is taught in your schools, and then you may explain your idea of enlarging and teaching subjects which pertain to agriculture?—A. The usual studies taught in our schools are arithmetic, geography, grammar, reading, bookkeeping, and writing. I think that agriculture should be taught, for I believe that it is as important that every boy should be taught agriculture as it is for a young man if he intends to be a lawyer or a doctor to be taught those professions. I think they should teach agricultural chemistry in order to be able to analyze the various soils, to be able to analyze the fertilizers and know their value. I think in the primary school the first principles of agriculture should be taught and, where it is possible, they should go to agricultural colleges and have practical lessons. It is very important in dairying now that a person should understand that thoroughly; should be able to use the Babcock tester, to know the value of his cows, the amount of butter fat in the milk, and how to select a good cow. I think that should be taught at the colleges and experiment stations in our State.

Q. You have an agricultural college in your State?—A. Yes.

Q. Have you an agricultural farm connected with it?—A. Yes.

Q. (By Mr. FARQUHAR.) Where?—A. At College Park.

Q. Is that well attended?—A. Yes. Since President Sylvester has been president of the college they have had to build an addition to accommodate the students.

Q. Any branches taught besides agriculture?—A. The mechanical arts, horticulture, and dairying.

Q. Do you teach the classics?—A. Yes; I think there are more of them educated for that than there are for agriculture.

Q. Do they get a diploma for different courses of study?—A. I think they do.

Q. Do they receive a diploma for the agricultural course, say, bachelor of agriculture?—A. Yes.

Q. You have a scientific course?—A. Yes.

Q. A separate diploma is given for that?—A. Yes.

Q. You have a mechanical course?—A. Yes.

Q. And give a diploma for that?—A. Yes.

Q. Have you an experiment station in your State?—A. Yes.

Q. You may state how efficient you think that is.—A. That has been a great help to the farmers of Maryland. Those who will take the pains to get the bulletins (which they can by sending their address) read them. It has been a great help to the farmers. They often let the professors come out to our institute meetings and Grange meetings and give lectures on various subjects, and that is of great benefit to the farmers. As an illustration of what they accomplish I will name one thing: Last year the average crop of wheat throughout Maryland was not to exceed 20 bushels per acre, but on a field of 12 acres at the college they had 40 bushels per acre. I inquired of the professor of agriculture how it was done. He said he attributed the small crop of wheat throughout the State to several causes. One was, on the 1st of April we had a very warm time a year ago; wheat took a very vigorous growth, and then the last of April it turned cold, pretty nearly snowed, and consequently wheat looked very poor. This weak plant was like a weak individual—disease attacked it. He thought that was one of the causes

of the light yield. I asked, "How is it that you have such a large yield?" He said, "We were looking at it, and I told the president of the college, 'the farmers' clubs are coming to visit us and we must do something for that wheat.' We went to work and sowed 100 pounds of nitrate of soda per acre, and it came right on. We attributed the yield to the fact of the sowing of 100 pounds of nitrate of soda per acre."

Q. He determined that by knowing the kinds of plant food necessary?—A. Yes. To show the benefit of the knowledge we got in the growing of early potatoes last year. I went to Professor Patterson to get a formula. In our grange we get the chemicals, instead of mixed fertilizer, and mix them ourselves according to the formula given by Professor Patterson. He gave us the formula, but did not put in any nitrate of soda. Some of our members thought it was strange and so I saw the professor and said: "Our members think it strange that you did not put in any nitrate of soda." He answered, "I did not put it in because I was afraid it would get away from you. It is very soluble and if you were to put it in the drill the spring rains would dissolve it and it would get out of reach by the time the plant would develop to take it up. If you want to use nitrate of soda, mix 100 or 200 pounds of phosphate, and sow it on the row when the potatoes come up." Some of us procured the soda and phosphate and sowed it under his direction, and we left several rows that we did not put it on. During the time the potatoes were making the weather was very dry, and this soda caused the vines to make very rapid growth and shadow the land and protect it from the drought, and where the soda was put on there was a good crop, and where we did not put on the soda there were hardly any marketable potatoes. That made several hundreds of dollars to those who used the nitrate of soda.

Q. Have you ever experimented in top-dressing to your pasture lands?—A. Yes; and we have used nitrate of soda; not especially on pasture lands, but on our hay crop; sowed 100 pounds of nitrate of soda per acre on the grass just as it was starting and it often increased the crop 1,200 to 1,500 pounds to the acre.

Q. Have you experiment farms under the control of the experiment station, except at the agricultural college?—A. In some cases they have experimented with various kinds of crops in other portions of the State.

Q. You have a variety of soil in Maryland?—A. Oh, yes; a great variety.

Q. Have your experiments at the experiment station gone far enough to test the different varieties of soil in different portions of the State?—A. No; I do not know that they have. The fact is, about all that is necessary for any soil is nitrogen, phosphate, soda, and potash. Large amounts of them they claim are in the soil. The great trouble is to make it available. This is done by the use of lime, which is a great help in many instances, and thorough tillage.

Q. (By Senator MALLORY.) You stated that the principal labor is negro labor; is there any other, to any appreciable extent?—A. Not very much.

Q. In your section of the State?—A. No.

Q. Do you know anything about the western and southern part of the State?—A. No, I do not; but I think as a general thing it is nearly all negro labor.

Q. Are these negroes that work on the farm, as a rule, stationary or migratory?—A. I think back from the cities they are more stationary than near the cities. Near the cities they are migratory.

Q. As a general rule they are hired labor?—A. Yes.

Q. Any of them do farming on their own account?—A. Once in a while; but not very many.

Q. Is there any requirement in your State that a man shall live in a certain school district in order to have his children attend that school?—A. I think not. There should be a law, but I do not think there is. If there is it is not enforced. In our school district they will go to Hyattsville, Brookland, or come into the District.

Q. What is your observation regarding the literacy of the average negro laborer?—A. They are improving.

Q. Many of them read and write?—A. Quite a good many of the younger ones; most of the younger ones can.

Q. What is their character for orderly life and demeanor—morality?—A. I do not think they are up to the whites by any means. I was on the grand jury at Marlboro, our county seat, and I think nearly every case brought before us was a colored case.

Q. What is the relative proportion of population of whites and negroes in that county?—A. I should judge there were about one-third colored.

Q. Do you consider the proximity of a large city like Washington as tending to bring about that effect?—A. Yes; I do. I think there is not as much criminality as you go back from the city; there are not as many criminals as near the city.

Q. (By Mr. FARQUHAR.) What are the reasons, if you know, for the crime among the black people?—A. Well, I think the use of intoxicants. They usually want a little money Saturday night, and they go down to Bladensburg, or wherever liquor is sold, and they get into cutting or shooting scrapes. They are generally under the influence of liquor.

Q. Have you local option in the counties in Maryland?—A. In Montgomery County they have local option. I think in several counties they do.

Q. Do you regard that making this county "dry" is some prevention against crime?—A. Yes; I do. A few years ago we had local option in Prince George County, and the sheriff of the county told me there were not nearly the number of arrests and the county expenses were much less.

Q. What is your observation of the percentage of crime caused by drunkenness?—A. I should judge almost nine-tenths.

Q. Do you think that drink is the bane of the black race?—A. I do.

Q. Do you not think it accounts for the more than natural shiftlessness of the negro, and his carelessness, and his transient condition, traveling from one spot to another, losing time and opportunities? Do you think that drink is the main cause of both the crime and indolence?—A. Yes. I have a man living on my place now who has been sick ever since last summer. The doctor says he is going to die. His condition was brought on by drink.

Q. Do you find the negro laborer a faithful, docile man when away from drink?—A. Docile enough, but I have never found one that was very trusty—that you could depend on to do a piece of work. He goes away Saturday and you expect him back Sunday, but you can place no dependence on him. If the month is up and you pay him off, expecting him to come back the next day, maybe you will never see him again.

Q. Do they work faithfully enough under supervision?—A. If you have a man right after them.

Q. Are they quarrelsome or sullen?—A. As a general thing they are not, unless they have liquor about.

Q. Most of your farmers in Maryland are native Marylanders?—A. A great many of them. Quite a number of them are Northern and Western men.

Q. When did the Northern men come in there?—A. During the last 20 years.

Q. And those who take up Maryland farms usually become permanent?—A. Yes.

Q. It is noticeable to every man who passes, especially along the railroads of Maryland there, that there is a large amount of abandoned land. Can you say why it is that those farms are abandoned entirely to the brush and to the weeds?—A. I think it is because during slavery it was owned in large tracts, and when the slaves were set free the planters thought they could not do anything with hired labor, and they did not attempt to farm it with free labor, and the consequence was they went to living out these farms. They mortgaged them to get means of support, and they fell into the hands of merchants here in Washington. A groceryman here owned perhaps half of Prince George County, by furnishing goods and having to foreclose mortgages and take the land. That has thrown large tracts into the market, and they have them on their hands and want to dispose of them. Another thing which causes them to be unoccupied is that they have grown crops on them continually, crop after crop, until they have exhausted the land, and let it grow up to brush, weeds, and timber.

Q. What do these abandoned lands sell for now, especially in Prince George County?—A. Different prices. From \$6 to \$10 an acre. President Sylvester bought 200 acres for \$900 in southern Maryland, and he was so pleased with it that he and his brother-in-law bought 1,700 acres for \$10,000.

Q. Has there been much reclamation of these abandoned lands of late years?—A. They are taking hold of them now more than a few years ago.

Q. They are good soil and all they need is intelligent cultivation?—A. I remarked to Dr. Hill, near Marlboro, "You have good lands and all they need is intelligent cultivation, get the lands into clover, etc." He says, "The farmers down here do not want to raise any clover when they can get fertilizer in Baltimore by just signing a note."

Q. (By Senator MALLORY.) What, in your judgment, is the condition of the farmer of Maryland to-day as compared with what it was 20 years ago?—A. I do not think the average is as good as it was.

Q. To what do you ascribe that decadence?—A. The low prices for farm products and farm machinery has had a tendency to make these lower prices; and the opening up of the West.

Q. Sharper competition?—A. Yes. As a class, the farmers have not kept up with the times. They have kept in the same ruts. They have not endeavored to produce at lower prices, tried to keep up their land cheaper, and raise better crops;

they have raised the same crops year after year, and have not applied business principles to farming.

Q. Do you observe any impulse, under the stimulation of experiment stations and agricultural colleges, in the farmer to advance some in that matter?—A. Oh, yes; since the experiment station has been started. We succeeded in getting a bill through our legislature for a small appropriation for holding farmers' institutes; that has had a tendency to improve conditions. But the very class who need this instruction do not attend these institutes and meetings. They are the ones who are seldom there. They call it "book farming," call it "theory, not practice;" but there is where they are mistaken.

Q. Are you engaged in truck farming?—A. I am a dairyman.

Q. Do you know whether the importation from the South of early vegetables has any effect on the market here?—A. Oh, yes; it has a tendency to lower the prices.

Q. Is there any steady shipment from the South during the vegetable season, or is it sporadic?—A. Yes; generally through the season. It commences down in Florida and works along up the coast. Now the Norfolk early potatoes are coming in and keeping the market down lower than it would be if it were not for these.

Q. (By Mr. FARQUHAR.) You are not able to go into the market when Florida or the Carolinas come in?—A. Yes; but get lower prices.

Q. Nor when the Carolinas come in?—A. No.

Q. Where is the first line that touches you—Virginia?—A. Yes.

Q. You have the advantage, certainly, against crops of lower Virginia, have you not, in the market?—A. I do not know. The transportation, especially by boat, is almost as cheap as it would be to bring it from 10 miles out by wagon.

Q. Does any competition come from the South while your products are coming into the markets here?—A. In potatoes.

Q. What else?—A. Tomatoes, strawberries, etc.

Q. When you have the flush of strawberries here?—A. Not with the flush; that could not be.

Q. Do you export North after your season passes here, when you have an open market North?—A. Commission men do to some extent, but gardeners do not, though I think they should.

Q. You could not be under a disadvantage when you consider the Florida production and this middle production here of the District and Maryland, and the northern district of Pennsylvania and New York?—A. Yes; but there are various objections. The vegetables come up from the South, and the people have them until they get tired of them, and there is not the demand there would be if they had not had those.

Q. (By Mr. A. L. HARRIS.) Is the capital employed in agriculture as profitable as it was 30 to 40 years ago?—A. It is not.

Q. You may state the reason.—A. The lower price of farm products; and another thing, our taxes seem to be increasing all the time.

Q. If the price of the farm product is low for a series of years, it affects the price of land?—A. Yes; it affects the price of the farms.

Q. In other words, the more profitable the farms the higher the price of the land?—A. If wheat was bringing right along for a number of seasons \$1, \$1.50, or \$2 a bushel, farm lands would be sought for, and would advance in price.

Q. Compared with other business, how does capital employed in agriculture yield profit?—A. It does not seem to do near as well. You do not find capitalists investing in farms. They seem to prefer trusts, banking, and things of that kind instead of buying farms very much.

Q. Is it not a safer investment, when properly invested?—A. For my part, I would rather have what I have invested in my farm than in anything else. I can manage that, and I would be a poor hand to manage anything else.

Q. Taking the farmer as a rule, what is his condition, from your observation, as to the necessities of life—good living, getting out of life a comfortable living?—A. A good many seem to have it. That is one trouble—the farmers like to have their sons and daughters dress well and have as good horses and carriages, etc., as those engaged in other business; and it is often the case that the farm is mortgaged to do that. Thirty per cent of the farms in Maryland are mortgaged, and I am told by those who know that of those who were free from debt 20 years ago, many have mortgages on their farms to-day.

Q. You mean when the sons and daughters get a taste for dress and pleasure they neglect the duties of the farm?—A. Yes; I think so. The tendency of the farmer is to gratify his sons and daughters, and the profits of the farm are taken to pay it.

Q. Can the banker or the mercantile man on the same capital give to his family greater comforts than the farmer gives to his family, as a rule?—A. I could not say as to that. I am not familiar with banking. It is said, I believe, that 90 per cent of the people who go into the mercantile business make a failure, and I do not believe there are so many farmers.

Q. Are there many farmers who make failures?—A. Yes.

Q. (By Mr. FARQUHAR.) In other words, \$5,000 invested in your farm is a better investment in your mind to-day than \$5,000 put into a produce commission house down here on Louisiana avenue?—A. It would be for me.

Q. And you think that for yourself, family, and your peace of mind, in fact, your home comforts, you are 50 per cent better off than this man struggling here in the market with his \$5,000?—A. I think I would be. I would sleep better of nights and have better health.

Q. (By Mr. KENNEDY.) Do you look with favor on Mr. Havemeyer's suggestion that the farmers form a trust to regulate prices of their products?—A. I think it would be a good thing for them, if it is a good thing for other classes. But that is the last thing they would ever be able to accomplish. It would be the worse trust extant if they could do it, for a man has to have something to eat. There would be a howl if the dairymen should say no milk should come into Washington for a week.

Q. Is not the grange looking in that direction?—A. Not at all; no.

Q. They never discuss that subject?—A. No; they have never discussed it in a formal way. If cabbages are worth \$4 a hundred on the market and some man comes in and quietly offers \$3.50, the farmer would let him have them.

Q. Are Maryland farmers in favor of that kind of a trust?—A. I would be if it could be accomplished. I am quite sure it could not be. The only way we can do is to lump our orders and buy in large quantities. Our grange last spring bought 300 barrels of seed potatoes. We buy them in carload lots and make quite a saving. We buy our fertilizer, and there is quite a saving in freight; and when we come to sell, in certain instances we might ship off to certain points and combine to control prices. The only combination that I know of of this kind is what is called the Five States Milk Producers' Association, near New York. The dairymen have combined to a certain extent to maintain prices. There is a trust, formed in New York City, of dealers to handle milk and get it from the dairymen at their own prices. Through the influence of the American Agriculturalist the farmers formed what is known as the Five States Milk Producers Association, with agencies at nearly every shipping point on the lines that ship into New York; and at these stations they put up a creamery or cream separator, and have a man in New York to tell how much should come from each station, and they send on that quantity and keep the surplus off the market, and obtain a fair price. They made a contract with this syndicate in New York to furnish milk at \$1.17 per 100 pounds, whereas they were only getting before this organization 80 cents, about 2 cents a quart in summer and about 3 cents in winter. That is about the only organization of farmers that I know of that has accomplished anything in that line.

Q. (By Mr. A. L. HARRIS.) What have you to say about the taxation of agricultural property and its bearing upon agricultural property compared with other property in Maryland?—A. I think in Maryland and other States agricultural property bears a larger taxation in proportion to the profits accruing than any other, because it is all visible property. The assessor sees everything that the farmer has and it is taxed.

Q. That is supposed to be the case with all property, is it not?—A. That is supposed to be the case, but a great deal of invisible property never is taxed.

Q. How does it escape?—A. I believe many men would perjure themselves in giving a statement in regard to their property to be taxed when they would not in any other case.

Q. Who fixes the valuation in your State?—A. The owner first makes out his statement and then the assessors fix it to suit themselves afterwards although you can go before the board of review and get it cut down if it is not right.

Q. The merchant and banker are required to do the same, no exception?—A. Yes.

Q. Personal property?—A. Yes.

Q. How often do you value real estate for taxation?—A. I have lived in Maryland for 20 years and they have never had a general assessment until, I think, a year ago last summer.

Q. Is that true of city property as well?—A. I could not say as regards that. I think in Baltimore they assess oftener than that.

Q. What do you mean by general assessment?—A. During the regular assessment the treasurer goes over the district and sees the improvements made or

buildings put up. But a law was passed by the legislature, I think 2 years ago, and the assessors went around and made a list of all the property, both real and personal, and made a new valuation.

Q. Is your real estate assessed for taxation now at the same value it was 30 years ago?—A. Well, 20 years ago is as far as my judgment goes. They have increased it very much.

Q. Is your real estate as valuable as it was at that time?—A. Oh, yes; it is more so, as the city extends out that way.

Q. The State at large?—A. Through the State I could not say it is. It is only property contiguous to the cities that has increased very much. In Montgomery County and southern Prince George they lowered the basis of taxation.

Q. You have no regular period for reappraisal of real estate all over the State?—A. No. When they want a reappraisal a bill is passed by the legislature.

Q. (By Senator MALLORY.) Can you state the percentage of the State tax in Maryland?—A. I think 17½ per hundred is the State taxation.

Q. In addition to that you have a county tax?—A. Yes; I think our county tax is 90 odd cents on the hundred.

Q. Does Maryland have a tax for bonded debt?—A. I can not say for the State. Our county has, from the fact that a number of years ago they decided to borrow money and go on a cash basis, and they had to bond the county for, I think, \$80,000 to do it.

Q. Have you a State school tax and county school tax also?—A. Yes.

Q. Do you know what the State school tax is?—A. That is included in the whole amount.

Q. How do you build your public roads in Maryland?—A. They are not built at all, you might say.

Q. There is some law on the subject?—A. Yes; there is a law in regard to it, but it is a very poor law. The commissioners of the county appoint supervisors, and they generally appoint men of their own party as a compensation for political work; and that is about the way our road system is worked out.

Q. Is the fund out of which it is built a tax on the county?—A. Yes.

Q. People are not required to work the roads?—A. No. Gen. Roy Stone told us at the grange a year ago that \$600,000 had been spent every year in Maryland for the improvement of roads which were never improved, and I think he is about right. The roads are no better than 20 years ago. If the money was judiciously used, we should have had good macadamized roads all over the State.

Q. Each county has a road commissioner?—A. Our county is divided into 14 road districts or precincts, and there are 3 commissioners appointed for each district. Their duty is to go over the roads and see their condition and make a report as to the amount of money they need to have expended on them. I have acted as such commissioner, and we sent in a report, and 9 times out of 10 it was put in the pigeonhole and never taken out.

Q. If the commissioners make a report, the county is the one to furnish the funds?—A. Yes.

Q. Does the State furnish anything at all for the building of roads?—A. No. We have a liquor-license fund which generally goes to the roads.

Q. What becomes of your fines for criminal offenses?—A. I could not say.

Q. (By Mr. A. L. HARRIS.) Have you anything to say as to a remedy in regard to tax methods?—A. I think a system of annual assessment like in the West, if it could be done as cheaply as it is done there, would be more equitable than being assessed once in 10 years. Property changes very much in value during that time. When I first came to Hyattsville I had 20 cows and 3 horses. The treasurer came and took down the amount of stock I had. I paid tax on that for 10 or 15 years, while I had double that amount a good deal of the time. In a good many cases a good deal of property escapes taxation that way.

Q. Suppose your property should be reduced?—A. I would be paying tax on the full amount I was assessed for. I think there should be an annual assessment, and instead of having 3 assessors, as in these cases, 1 should be sufficient to do the work. It could be done economically, and would be better for the taxpayer and all classes of property. I think it would be a good thing if we could have an income tax. All corporations, etc., should pay their share of the tax.

Q. And everything else?—A. And everything else.

Q. What is your opinion as to the inheritance tax?—A. That would be a good thing.

Q. Both direct and collateral?—A. Yes.

Q. Have you any suggestions to reach stocks, bonds, money, notes?—A. That is the only way that I know of. They used to claim in the West they could not tax

mortgages—that is, of nonresidents—but they arranged that. They allowed the mortgagee to pay the tax and deduct it from the mortgage.

Q. What is the per cent of the decline of agricultural products, if you know?—
A. A good many have declined. Wheat, for instance, has declined 25 per cent, at least.

Q. That covers the entire farm product?—A. Yes.

Q. You may state whether there has been an increase or a decrease in the acreage under cultivation in your State in the last 20 years?—A. It has decreased.

Q. Is it abandoned because no longer productive?—A. Partially so and partially because it could not be worked by the people who owned it at a profit.

Q. (By Mr. FARQUHAR.) You mean to answer that the ownership was in the hands of nonresidents?—A. Yes.

Q. (By Mr. A. L. HARRIS.) What is the character of your organization and causes inducing it, the objects you seek, and the results you have obtained by it?—

A. We organized for the social, educational, and financial benefits received from it. Largely the educational feature we considered the foundation of our order.

Q. Any profession except the agriculturist admitted?—A. No. They must be engaged in agriculture or in interests that would not conflict. We take in clergymen, school-teachers who teach our children, etc.

Q. Any distinction in regard to sex?—A. No; from the age of 14 years up.

Q. (By Mr. KENNEDY.) State the strength of the organization in your State.—
A. At one time we had a strong organization, but it has been reduced very materially. We do not seem to see the benefits a great many farmers do in the West and North. In the little State of New Hampshire they have 21,500 members, in something over 200 granges, but the order throughout the South is not generally very prosperous.

Q. (By Mr. FARQUHAR.) Was there not an expectation on the part of many that it would assume political features, and they were disappointed that it did not?—
A. Yes.

Q. Is not that one reason for the lessening of your numbers?—A. That was one of the causes. When they found out the grange could not be used for political purposes they withdrew. A great many went in expecting it was going to put dollars into their pockets without any effort on their part, and they were disappointed and withdrew. While we have now a prosperous grange in our neighborhood, a great many farmers do not take interest in the organization; do not see the benefit of the educational feature. It is something of a farmers' club. At every meeting we have questions selected to discuss at the next meeting. We have some who read papers on those questions, and we often invite the professors from the Agricultural Department and from the college to our county meetings. The greatest benefit derived, I think, is the education we receive through the organization.

Q. (By Mr. A. L. HARRIS.) You confine your discussion to agricultural questions?—A. Yes. Partisan politics or sectarian religion is not allowed to be discussed. We are not necessarily confined to agriculture. Any question which may be of interest to us as agriculturists is acceptable to the grange.

Q. What benefits have you received from your organization, in your estimation?—A. We have been made better farmers and better citizens, and the social feature is worth a great deal. We form a great many acquaintances which we would not but for the grange, and we know our neighbors better, and there is a fraternal feeling existing in the order which is beneficial. I lived 10 years right out here, and you might say I did not know my neighbors for the first 10 years, but when the grange was organized I found I had some excellent neighbors I did not know before. We become acquainted throughout the State more or less, and I think it is a great benefit to us as agriculturists. It is said that 2 men can not converse together 10 minutes without learning something, and if we meet other grangers from the State we learn something.

Q. Creates a higher ambition?—A. Yes. A great many grangers exhibit their products; exhibit what they have grown and tell how they have grown it. As one man expressed himself, "I have been a gardener and trucker for 30 years and thought I knew all about it, but when I joined the grange I found I did not know anything."

Q. Your meetings are pleasant and attractive as well as instructive?—A. Yes; I think so.

Q. Do you see any difference among your farmers who belong to the grange, in their manner of farming and in the condition of their farms?—A. Oh, yes; a decided improvement, I think. They are better farmers; I believe there are very few grangers who attend the grange meetings but make better farmers and better citizens and are more prosperous. The great trouble with the farmers in Maryland is they do not understand their business thoroughly enough.

Q. You think a general interest in the grange throughout the State of Maryland would have a good effect on the farmer?—A. I do.

Q. And create a greater desire to see his children better educated?—A. I think it would.

Q. Give a wider expanse of knowledge to his children by the time they grew up?—A. I think so.

Q. Have you anything further you desire to state in regard to the advantage of an organization of that kind among farmers?—A. Nothing except what I have said, and bulking our orders, and the principles of doing business for cash. We claim it is better for a man to hire his money and pay interest than go in debt.

Q. (By Senator MALLORY.) Is this organization confined to the State of Maryland or is it in connection with the granges of the other States?—A. We have a national organization, the State organization in the several States, the county organization, and the local or subordinate organization.

Q. What is the title of the national officer in charge?—A. Master of the National Grange.

Q. You have your national convocations annually?—A. Yes.

Q. And your State convocations annually?—A. Yes.

Q. County?—A. Quarterly.

Q. And your local organizations?—A. Weekly, monthly, semiweekly, or semi-monthly.

Q. How is the attendance?—A. Generally good, except perhaps in the busy season of the year. In the winter attendance is better than in the summer.

Q. Since the decrease in membership have not the remaining members shown more interest than the bulk of the members formerly?—A. I think perhaps they have.

Q. Have you a larger average attendance than you had when the membership was larger?—A. Well, that differs with different granges. Some are larger, some not as large. It depends a good deal on the locality, distance from meeting, etc.

Q. (By Mr. KENNEDY.) Are you influential enough in Maryland to secure legislation favorable to the farmer and prevent inimical legislation, as the grangers of Kentucky and New Hampshire are?—A. No. We are not as strong as in New Hampshire and some other States, but we have secured something for our benefit in the past, and I think perhaps we may be able to do so in the future. Through the instrumentality of members of the grange and the college a delegation several times went to Annapolis and secured an appropriation of \$4,000 for holding farmers' institutes. We never attempt anything in a partisan line at all; only what we consider to be for the general good. We are not a political organization in any sense of the word.

Q. (By Mr. FARQUHAR.) Have you a large representation of the farming interests in the Maryland legislature?—A. No, very small; a good deal like it is in Congress—very few farmers.

Q. Do you think the farmers of Maryland, according to their numbers and the interests of the State they represent, are as well represented in the legislature of Maryland as other classes?—A. I think not.

Q. (By Mr. A. L. HARRIS.) Please describe the object of the farmers' institute and the work performed, in a few words.—A. There is a director of farmers' institutes appointed, and he holds a meeting, and notice is given of the meeting and different subjects which will be discussed. If he is going into a locality where dairying is the principal business, dairying will be the principal subject. If he is going to hold an institute in a locality where truck farming is general, he will have that for the principal subject. He will secure speakers, and if they can not be obtained in the State he will go out of the State and get practical men in these lines—either in dairying, fruit-growing, or gardening—to come and deliver addresses. At the close of the addresses the speakers are questioned. Anyone is at liberty to ask questions in regard to anything he may wish to, and in that manner it enlightens the farmer on various lines, which information he would not get if it were not for these institutes.

Q. How long do you hold your sessions, usually?—A. They have been holding them only 1 day. They have not had sufficient funds to hold them more than 1 day; but they have perhaps 3 sessions—morning, afternoon, and night.

Q. (By Senator MALLORY.) Please state what effect you think institutes have?—A. As far as we can get the farmers out I think it has a very beneficial effect. The director, Mr. Amos, thinks they have been much better attended the past year than formerly. The more interest created in them, and the larger the attendance, the more benefit will be derived by the farmer.

Q. (By Mr. A. L. HARRIS.) In your opinion is the condition of the agriculturist improving?—A. I think it is.

Q. And his family have more comforts than they had before?—A. Yes. I think if the farmer understood his business as thoroughly as most other classes do their business, and applied business principles to farming, they would be a great deal more prosperous to-day. They would know better how to improve their farms, and consequently would make more money. As the saying is, "There is always room on top," if they produce a first-class article. Hardly any of the butter the farmer brings in on this market would bring a first-class price. The people send out to Illinois and Iowa and get Elgin and creamery butter, whereas if a farmer living near the city would make a good article he would be able to command first-class prices.

Q. So he puts in the labor without intelligence, and has to sell his product at a low price?—A. Yes. He wants intelligence in his business to make it successful.

Q. Do you wish to say anything about the present production and existing markets?—A. I think there is an overproduction—I do not know what the remedy would be—of a good many things.

Q. Is it something that can be affected by legislation?—A. No; I do not think it can. Some say there is overproduction and others say there is no overproduction but that the people have not the money to buy and consume. I do not know.

Q. If your organization should ever become more universal would you be able to take advantage of the products that are overproduced and turn them to products that, I might say, are underproduced?—A. Yes. There are certain things that are imported; they say there are a great many eggs imported into this country. Certain things are imported here which should be produced here. The tendency of the American farmer is to work along certain lines and stick to them without regard to changed conditions or changed demands.

Q. You would be an advocate then of diversification in farming and agriculture?—A. Certainly. The diversification of farming and the rotation of crops, I believe, is the only successful way to farm.

Q. What effect, if any, has the improved agricultural machinery had upon the production and the ability of the farmer to produce?—A. Of course a man is enabled to produce a great deal more at less expense than without the machinery.

Q. Would it be possible at the present time, with the amount of labor there is on the farm, to produce without the assistance of machinery?—A. No, I think not; not with the amount and class of labor that we have here at least.

Q. Has not the improved machinery largely taken the drudgery away from the farm?—A. Yes; very materially so. There is quite a difference between mowing with a mowing machine and the way I used to do it by swinging a scythe.

Q. And your binder is preferable to the old-fashioned cradle?—A. Yes; I served my time at both.

Q. Have you anything to suggest in regard to the possibility of extending foreign markets?—A. I hope it may be done. I suppose that Secretary Wilson is laboring to accomplish that. Secretary Rusk did accomplish a good deal, I believe, formerly.

Q. What per cent of the exports come from the farm?—A. I believe they said that last year 70 per cent of our exports were of agriculture. It is the farmers that deserve the credit for the balance of trade, I think, which is in favor of this country. I think it is what has brought the gold into this country.

Q. Have you anything to offer the commission as to the best means of extending foreign markets outside of what has been suggested in the way of consuls by the Secretary of Agriculture?—A. No. I believe they should labor to that end as consuls.

Q. Have you anything to say in regard to carrying the tonnage of this country on American ships?—A. I should like to see it done.

Q. It would be of interest to the farmer, would it?—A. Yes; I believe so. I think it would be much better for the interest of the farmers to have the ships manufactured here in this country than to take the oak timber from out here in Howard County and send it to Europe and have the ships built of it there.

Q. What have you to say in regard to the decrease in transportation rates in this country?—A. There has been quite a decrease; especially from the West to the East.

Q. Has that affected the Maryland farmer?—A. Of course; it has lowered his products very much as the trade from the West has increased.

Q. Low transportation rates, then, in your opinion, have affected the Maryland farmer adversely?—A. Yes; as far as the sale of his products is concerned. You might see an offset against it. We dairymen have to buy bran and mill feed from the West and low transportation rates help us.

Q. How much do you have to pay for bran?—A. I bought a carload in connection with some others and I paid \$15.50 per ton, about a month ago.

Q. Has your State any laws touching the subject of pure food?—A. No; I do not think we have.

Q. What is your opinion in regard to the necessity of a law of that kind?—A. I think there is a great necessity for such a law. I think the adulteration of food is not only injurious to health, but it is a detriment to those who will produce pure articles of food.

Q. In what way is it a detriment to the producer?—A. It lessens the price. This oleomargarine and butterine which they have takes the place and lessens the price of a good article.

Q. What would you suggest in the way of protection from oleomargarine?—A. I should suggest that they have a heavy tax upon it, or have it colored pink instead of having it colored butter color, so that people, if they want to buy it, might buy it for what it is and not for butter.

Q. (By Senator MALLORY.) Is that done to any great extent now—selling it for butter when it is in reality oleomargarine?—A. Perhaps not as much as it was. They have a stringent law here in the District, and there have been several prosecutions and convictions under it, and of course, they are not doing it so much.

Q. Many of the States have prohibited it?—A. Yes; many States have. I guess Iowa has about abolished it.

Q. (By Mr. A. L. HARRIS.) You have no objections to oleomargarine being sold as oleomargarine?—A. No. If a person wants to buy it, he can buy it; but I think if he would go into some of these packing houses in Chicago and see how they make it, he would not want to buy it.

Q. (By Mr. KENNEDY.) Is coloring resorted to in dairies in making butter?—A. Oh, yes; there is very little winter butter but what is colored.

Q. The same thing is done for oleomargarine, which is sold for butter?—A. It is sold for butter.

Q. Supposing it is labeled, as it is here in the District?—A. I do not suppose there would be any objection where it is sold for what it is and a person knows it.

Q. (By Mr. FARQUHAR.) Is oleomargarine a wholesome food?—A. As far as I know, no. I would not buy any of it for my own use.

Q. Have you ever used it?—A. Not that I know of. I may have. I think that they take most kinds of grease to make it of. In the way of deodorizing of it and purifying of it, they claim—

Q. (Interrupting.) Are you aware of the fact that there is not one single pound of it made from deodorized material in this country?—A. No; I am not.

Q. (By Senator MALLORY.) Your objection to these adulterations is that they are sold to the public under false pretenses?—A. Yes.

Q. (By Mr. A. L. HARRIS.) What, in your opinion, is the advisability of Federal legislation on the subject of pure food?—A. I think there should be a strong law against the adulteration of any kind of foods; that is, that would be injurious to health. As far as the coloring of butter is concerned I do not think that any of you gentlemen would use winter butter, white as it is, in preference to the colored article, providing, of course, you knew it was colored. A preparation of annatto is used in the coloring of butter.

Q. Have you anything further to suggest on the subject of adulteration?—A. Some of the dairymen here in the city are coloring their milk. That gives it a richer appearance, whereas there may not be the same amount of fat in it as in samples that were not colored. It gives it the appearance of being better, and it is bought in preference to the milk of the man that does not color his milk; and so in cream. There have been several arrests, and they are not doing it as much as they were. Some test was made last winter. Parties were arrested here in town for selling colored cream and milk. I think it requires 20 per cent to be pure fat in the cream to be the standard; and they found some of the colored samples were only 14 per cent, while, as to appearance, they looked just as well as those which contained 20, which were not colored.

Q. (By Mr. KENNEDY.) Does this coloring add to or take from the quality of the butter?—A. I do not think that it adds to or takes from. It adds to the appearance. It makes it more pleasing to the eye.

Q. (By Mr. A. L. HARRIS.) What is the coloring matter you use?—A. A preparation of annatto is used largely. It is largely manufactured by Wells & Richardson, of Vermont. They make what is called Wells & Richardson's butter coloring which, I think, is largely used by the creameries and dairymen throughout the country.

Q. (By Mr. FARQUHAR.) What is the nature of the matter—harmless, clean, and very nutritive?—A. I could not say.

Q. (By Mr. A. L. HARRIS.) Do different kinds of feed affect the color of the milk?—A. Yes. If you had carrots to feed that would tend to make the butter

more yellow. The feed has a great deal to do with it. During the summer season, when you get grass, there is no necessity of coloring either milk or butter; it is yellow enough.

Q. Is the coloring that is used in milk or butter deleterious to health?—A. It is claimed that it is not. I hardly think that it is. This annato is a vegetable matter which is not injurious to health.

WASHINGTON, D. C., June 22, 1899.

TESTIMONY OF MR. L. W. YOUNANS,

Farmer and Merchant, Fairfax, South Carolina.

The commission met at 10.50 a. m., Mr. A. L. Harris presiding. At 2.30 p. m. Mr. L. W. Youmans, of Fairfax, S. C., was introduced and sworn as a witness.

Q. (By Representative LIVINGSTON.) What can you say as to the condition of agriculture in the South?—A. In my section of the country it is in a deplorable condition. I can not say that it is from any vicissitudes of the season, from any lack of industry on the part of the people, or from any failure in the soil to respond to cultivation. At least for the last 2 years the seasons have been good. I have not seen anything especially wrong in the industry of the people, and the yield has been abundant. But the fertility of the soil, the propitiousness of the seasons, the industry of the people, and the abundant harvests, so far from securing a benefit to the country, as in past years of prosperity and plenty, seem to have brought about hardship and distress. There must be some cause for it and the cause must be artificial. We can not charge it to natural circumstances. To claim that the triumphs of art or the bounty of nature would result in an overproduction of the good things of life and therefore bring about hardship and distress, it seems would be to argue an absurdity.

Q. Will you give us the conditions of the landholder and the laborer in the Carolinas and the South? Are they in debt?—A. Yes; the small landholders are being forced to give up the title deeds to their land, and with the large landholders, under present conditions, it will only be a question of time until they follow suit.

Q. Is that done in the form of mortgages?—A. Yes; it just means that the proceeds of their crops will not pay the expenses of making them. I can give you my own experience. I think I have as fine a plantation as there is in my section of the State; I have it all stocked; I have as well-disciplined labor as there is in my section of the State, and I considered the 1st of January whether there was any crop that I could plant on that land with the certainty of reaping a profit. It was suggested by some gentleman who testified before this commission that they ought to diversify. My experience is not confined to raising cotton. I have raised watermelons, corn, vegetables, and other crops which grow in my country, and, after mature reflection and an experience of 30 years, I thought the best promise would be in cotton. I tried it last year and I lost money on it. The very same consideration was given the subject again when I started in January of this year and I thought cotton was the best chance, and I am going into cotton again.

That question will lead right up to wages. The charge is made against the agricultural element that they are extravagant. I do not think that will apply, especially to my experience, and right here the element of cost of the production comes in. I have heard a great deal about the protection of American labor, but I do not see any of it in my section. Take my plowmen, for instance: I employ them by the month, and they make 5½ days' honest good work each week, unless they are interfered with by the weather or sickness; but the application of what I am going to say is on the supposition that they perform 5½ days' work; it is all that is counted and a little more than we got from the slaves before the war; and these hands on my plantation I allow to have 2 acres of land, and the plowmen, if I do not need the animals, have the use of them on Saturday evenings. But when I settle with them at 12 o'clock on Saturday or Friday night, I pay these hands for their 5½ days' work, in addition to their rations of 1 peck of meal and 3 pounds of bacon and salt, 60 cents in trade, to be traded out in the stores at 50 per cent profit, and 20 cents in cash; that is all they get for 5½ days' labor. If I employ the labor by the day—and there is a great deal more of it than I have any need for—I pay them 80 cents, one-fourth in cash and three-fourths to be traded

out at 50 per cent profit; and yet raising the crops as cheaply as that the proceeds will not meet the expense of raising.

Q. What monthly wages do you pay?—A. \$5.20 for 26 days' work.

Q. (By Mr. KENNEDY.) What do you mean by "being traded out at 50 per cent profit"?—A. They take orders on the store. I run my plantation in connection with a store and the instructions are to put 50 per cent profit on the goods sold. I will say that my labor is about as well paid, as well clothed, and I think the best satisfied labor in that vicinity.

Q. (By Representative LIVINGSTON.) Have you tried diversified farming with the same labor?—A. I have tried watermelons.

Q. Wheat, corn, and oats?—A. I do not raise wheat. There has been an experiment made of wheat there this spring, but it was not very satisfactory; but we have had a very unusual spring, very dry. I can get wheat flour cheaper. It is cheaper in my section to raise cotton than wheat. Our section does not produce wheat.

Q. Do you find your labor efficient?—A. Yes. I have no complaint to make of my labor at all.

Q. They are colored?—A. Yes.

Q. If you should adopt another method, and succeed in manufacturing the cotton that you raise on your plantation instead of selling it in its raw or crude state, what would be the result to you?—A. I could not give you any reliable information on that point, because I have no experience as a manufacturer.

Q. From a general standpoint, do you believe that any man can sell any raw material produced at a profit, whether cotton, flax, watermelons, or anything else?—A. I always sold my raw material at a profit until 1890. I was a cotton planter, and made money steadily until 1890.

Q. Why is it that since 1890 cotton is unprofitable?—A. Not only the cotton, but there is scarcely any industry that is profitable in that section. Low prices are not confined to cotton, but to all products we raise.

Q. (By Mr. KENNEDY.) Are the prices of all the products of labor declining?—A. Yes; as a general thing. Of course there are temporary reactions in certain lines, but the tendency of prices is downward.

Q. We have had testimony here to the effect that the prices of many products are increasing.—A. That is only a temporary increase; it will not hold. I am talking about over a period of years.

Q. (By Mr. RATCHFORD.) How do you know that, in the light of the past?—A. I know it because I could sell for \$20 twenty years ago what I can not get \$5 for now.

Q. You believe history will repeat itself beyond a doubt?—A. I believe history repeats itself. I know this matter of prices repeats itself, and I can prove it by the decline in the '20s and '40s, the rise in the '50s, and the decline since 1872.

Q. (By Representative LIVINGSTON.) Can you give the comparative prices of some of the leading products in 1873 and 1878 up to now outside of anything you have given? Take cattle, horses, wheat—anything you please.—A. I can take what I deal in. I have paid 9 and 10 cents for meat and I can buy it now for 5 cents. Taxes, debts, and all fixed charges require just as much money as they ever did. These have to be paid out of the products of labor. They are worth half what they were in 1873. It takes twice as much of the products of labor to pay these debts, and these liens pretty nearly cover the entire sales of the products, and it leaves nothing to the producer to purchase on his own account.

Q. Are rates of interest much lower now than they used to be?—A. I can not say that the rate of interest is; in that country it is not any less. We pay 18 per cent to the banks for money now. I pay it.

Q. (By Representative GARDNER.) Where is that?—A. Barnwell County, S. C. I started to raise cotton on a basis of 7 cents. My debts were all contracted on a basis of cotton at 7 cents. When I sold my crop it did not average me over 4½ cents a pound. You see very easily I could have made money if I had got 7 cents, or even 6 cents, but when I got only 4½ cents I met with a loss, and so did every man who advanced on the cotton crop. Cotton has been steadily declining since 1873. There have been reactions, but the tendency is downward.

Q. (By Mr. RATCHFORD.) In that connection, is it not a fact that everything else has had a downward tendency?—A. Yes.

Q. Has the decline in cotton been greater than other commodities?—A. Cotton sold in 1871 at 20 cents a pound; I sold my last crop at 4½ cents a pound; that would be a decline of 75 per cent. I do not think other commodities have declined so much. I think there has been an average decline of about 50 per cent.

Q. (By Representative LIVINGSTON.) Did the farmers of the South largely contract the debts that now worry them prior to 1872?—A. I do not think so. Those

parties contracted and the lands passed out of their hands. Other parties have bought them, and they are going out of their hands now. We have to pay a usurious rate of interest—the agricultural element of our country. The discount is about 13 per cent when they can borrow from the bank; and when a man has not good collateral he has to borrow from the country merchant and has to give 50 to 75 per cent profit.

Q. Why is it you are required to pay 13 per cent?—A. I can not go to New York and borrow money. I can not go to Augusta and get money. I went there to make the experiment, and I said to the president of the bank: "I want to borrow money." "What security do you propose to give?" "Real estate." "I won't take that; any bonds?" "No." "We do not loan money on real estate." That throws me back on the country banks, where I can borrow money, but I have to pay 13 per cent. When money congests at these trade centers there is no automatic power to redistribute it. It stays there, and when it does come out it comes out from the town with brokerage, and you gentlemen know as well as I do that there is no business except successful mining and gambling that can stand 18 per cent; but that is what our people pay, and a great many pay more. I attribute that to the fact that there are no banks of private issue allowed in the country. I think it comes about as the result of the 10 per cent tax on the issue of private banks. I am not in favor of wild-cat banking. I am in favor of a judicious system of banking that will allow judicious circulation up to a certain amount, a judicious system of local issue, well regulated, limited by the General Government to a certain amount. In fact, we want our own money and we want to borrow money, and we ought to be able to borrow money at 6 per cent.

Q. (By Senator MALLORY.) County banks such as you have there at Barnwell, made money, did they not?—A. One of those banks has gone out of business. I do not think they made money. The president told me that they have a certain paid up capital; it amounts to \$40,000 to \$50,000. They very soon loan that. They get a certain line of securities and they arrange with New York banks to borrow money, and they pay 6 per cent. They bring that money back and have to make that 6 per cent, and they have to put on their profit. Everything is declining. Land is going down. Men took mortgages on land 5 and 6 years ago when it was worth more than now, and they can not realize what they advanced on the land. There is a general decline in prices.

Q. (By Mr. KENNEDY.) I believe you said there was no industry in South Carolina that was thriving. Is it true that the industry of cotton manufacturing there is thriving?—A. I do not know anything about the manufacturing of cotton. I think the depression of agriculture is so great and the wages so low—as I told you, 30 cents a day—that the manufacturers can get their laborers much cheaper than they can up North.

Q. They do not get labor at that rate in the cotton mills?—A. No; but when they can get men for that in the fields, for a little more they can get them in the factory; but I am not an expert in manufacturing; I can give you no information on that subject. There is very little manufacturing in my section.

Q. There is considerable in South Carolina?—A. In the upper part of the State, but I live in the southern part.

Q. (By Representative LIVINGSTON.) Do you think you could diversify farming and benefit the producer?—A. If I thought I could diversify to my advantage, I would do so, but there is no crop there that I can plant with more certainty of coming out even. I came to that conclusion from examining the market. Some years I can make money on watermelons, but if I strike it wrong it is a dead loss. Many have tried watermelons; they have tried potatoes, have tried wheat. I know a man who sunk lots of money in a vegetable farm. One went into the tobacco business, and I think he lost thousands before he quit. I raise all my home supplies, oats, corn, forage, and as a money crop I think cotton is the best I can do; but sometimes I try watermelons. Some years, when everybody had lost money and I thought they would get frightened and not plant them, I planted them.

Q. Is the labor you have fairly satisfactory?—A. It is satisfactory to me. I have no fault to find with my labor. I suppose I have between 300 and 400 negroes on my plantation, and I have no fault to find with their conduct. I am perfectly willing to leave my family there. They are like good, large children. They have to be looked after, but they respond to kindness more than any other race in the world.

Q. You have your foreman?—A. Yes.

Q. What has been done to educate the masses?—A. We are pretty heavily taxed to educate them. I do not think education is of any benefit to them. My experience is that if you educate the negro he is of no account, but I am very friendly disposed toward them, because I have been raised with them all my life.

Q. (By Mr. KENNEDY.) Have you introduced improved machinery into agriculture in South Carolina?—A. What do you call improved machinery, mowers, rakes, double plows? Further than that, in my experience, improved machinery does not pay, usually.

Q. Do your people take readily to machinery?—A. They can not run machinery; it is the exception.

Q. Do you prefer white labor to the labor you have in South Carolina?—A. I prefer colored labor.

Q. You do not want to colonize the colored man and send him out of the country?—A. No. I do not want this line of cosmopolitan people around me. The negro will respond to kind treatment. We do not look for mobs. I think we are the safest people in the world. I have traveled all over my State, and where there are only white people those sections do not look any more prosperous. No matter how much the colored man may make he will make way with it, but there is good in him. He is a good laborer and responds kindly to good treatment.

Q. Do you think it is detrimental to the negro to educate him?—A. I do not think it improves his morals; I do not think it is any advantage. That is my experience.

Q. Your own State of South Carolina is doing this?—A. That is public sentiment and we would be criticised if we did not do it. I pay the taxes and pay them cheerfully, but I think that is thrown away.

Q. (By Mr. FARQUHAR.) What is the difference between the competition of the white labor and black labor in South Carolina?—A. The cotton is raised by colored people. The white people raise cotton in competition with the colored man and for the same work we do not pay any more. My whole place is arranged in so much for a day's work, and no matter who I have to plow I pay the same for the work. I have overseers and a colored foreman that I pay more.

Q. Do you think usually a white foreman or colored foreman is the best?—A. I have 2 white and 1 colored.

Q. Is your preference in handling that class of labor for the white, or can you bring the black up to be good foremen?—A. There are instances where you can get good black foremen, but where you can not get there every day it is better to have a white man, because his judgment is better.

Q. Have you many white farmers who own their own land in the State?—A. Yes. They have the title deeds yet, but they are mortgaged. The small farmers are being crowded out. The mortgages have eaten them up. They get in debt, increase the mortgage, and every year it takes a little more, and finally they have to give up the deeds. I think it is only a question of time until most of them will be drawn into town.

Q. And the absorption of the small farms into the greater comes from the fact of the indebtedness?—A. A great many large plantations are being absorbed too.

Q. Is their indebtedness in the hands of the local brokers or bankers, or where does the indebtedness on farm lands usually lay?—A. It starts with the country merchant or cotton factor usually, and he borrows his money here at the North.

Q. Are your country merchants prosperous?—A. Not in my section. They lose money.

Q. How do your smaller banks do?—A. They are going out of the business; they have their money all tied up in real estate, and can not realize the amount of the mortgages.

Q. Is there not a good deal of difficulty in all the Southern States from the fact of the contraction of debts after the war, and is it not a debt problem more than anything else in the South; something like the Western States—Kansas, Nebraska, Colorado, and others—where they borrowed the money to buy the farm?—A. The old original landholders got in debt early. Cotton in 1886 down there dropped very heavily, and they all got involved, and their land has nearly all been parceled out, and the parties who have been more thrifty got them, and those lands in turn are being run out of the hands of the second parties now. I can scarcely hold my property, and I made it since the war. It is a struggle with me, not to make money, but to hold my property. You do not have any idea of it. I have been trying to give you an idea of it. I have not overstated the case at all.

Q. One of the great reasons is the low price of cotton, which is a cash article?—A. There is no business that we can engage in down there that we can make any money out of. I would gladly turn my hand to any business in which there was more money than raising cotton if I knew what it was. I could not go into manufacturing, because I have no money to buy material.

Q. Have you engaged in stock raising down there?—A. Our country is not very good stock-raising country, although I keep cattle there to supply my family necessities. We do not raise any for the market. Our country is not a good

country for pasturage. It is adapted to cotton, and we can get more money out of it than anything else.

Q. Do you raise sufficient produce there in your section to care for your own people, or do you import from the West and other parts of the South?—A. I raise my own corn and forage for the whole plantation, and I raise bacon for my own family, and I keep cattle there to supply the necessaries of my own family. As for my rations, I buy my meat from the West. I can buy it cheaper than 5 cents—cheaper than I can raise it.

Q. Where do storekeepers there in your section get supplies from—what cities mostly—West?—A. They buy groceries very often from Savannah and Augusta. They do not get any farther than that. I do not have to buy corn. When we do buy it, we buy it by the carload, sometimes West, but not much. We bought hay out West, but as a rule we raise that now. We did not use to do it. On one of my plantations there for a long time I raised cotton and bought corn, because I could get 10 cents a pound for cotton, and could buy corn by the carload for 60 cents, and I would put wheat bran with it and it would make a very wholesome and nutritious food for my stock. I can raise my corn, and I raise sufficient to supply all of my plantation needs.

Q. Do you raise there in your section all the mules that you have use for?—A. No.

Q. You buy mules?—A. I can buy Western horses cheaper than I can raise them. For the last 2 years we have been able to buy horses down there for \$40 to \$50.

Q. (By Mr. KENNEDY.) Are the colored people taken advantage of and robbed by the storekeepers down there in that section?—A. I do not think so. I think the general disposition toward the colored people is very kind. I think they are very kindly treated. If the colored man behaves himself, he is treated as well as anybody.

Q. I am not talking about that phase of it. I am talking about orders which are given, backed up by somebody else, for supplies, upon which inordinate profits are charged. Is that true?—A. I do not think they make any distinction between who it is on. I do not think any unfairness is shown, or any desire to take advantage of them on account of their color, none in the world. I know the feelings are very kindly there between the two races of people. If a man does not behave himself, black or white, he catches due reward; that is my experience.

Q. Do these money lenders take advantage of the white people by sometimes charging inordinate rates of interest and taking advantage of circumstances?—A. That is according to the man. He charges according to the probability of his getting his money. He covers the risk on all of them. A good man can go there, where pay is certain, cheaper than a man of more uncertain pay. The people are just the same there as they are anywhere else.

Q. (By Representative LIVINGSTON.) You do not think there is less humanity down there than up in New Jersey?—A. No; I think they are just as kindly disposed there as anywhere else, some good and some bad. The white and black are just as they are anywhere else. I have them on my plantation; some give me trouble and some do not.

Q. Do you have any immigration there?—A. They occasionally change and move about. Now, most of the labor on my plantation—I raise them. Their parents go there and stay, and they stay there. I do not have any trouble, and I do not see any difference respecting them now than when they were slaves.

Q. You have no European immigration there?—A. No; and I do not want it, either.

Q. (By Mr. FARQUHAR.) Have you any particular objections to state against European immigration?—A. No; I have no objections against anybody or anything. I can just get along with the colored people. I know them and they know me, and I am satisfied with their labor. A white man does not obey me any more, and generally puts me to more trouble, and he is harder to please as long as he stays with me.

Q. Have any of these colored people down there acquired land and little homes of their own?—A. It strikes me some years ago they did. I think they have been pretty well all "skinned" out. They have just about followed the small landholder. There may be some. I would not like to state that as a square-cut problem all round. I think that is the tendency; in fact, I do not know everything that has transpired, even in my vicinity. I attend to my business pretty closely. It is only my observation around there.

Q. (By Representative GARDNER.) How large is your plantation?—A. About 4,000 acres.

Q. Is it all arable land?—A. Partly timber; most of it arable land.

Q. And you employ how many men about?—A. I can not tell you exactly how

many there are. I plant about 1,800 or 1,400 acres. I cultivate entirely by wages. The balance of it, the houses are scattered all about, and they rent. Now, for instance, my plowmen and my foremen are about the only hands I have hired steadily by the month. It is understood by all the others that whenever I want them to work I pay some wages, and if they are working anywhere else they are to give me the preference when I want them, and when I get through with them they go back to their work. I suppose there are between 300 and 400. I raised about one-half of them.

Q. They do not work for you continuously?—A. I only hire them for 6 months, until the crops are laid away, and I pay them by the day.

Q. You have houses on the place and tenements, and those people rent them, I understood you to say?—A. Yes.

Q. They rent and work the land on their own account?—A. A great deal of it—what I do not attend to myself.

Q. With the understanding that they are to work for you whenever you want them?—A. When I want them. Of course I can accommodate myself to circumstances. Often they are busy with their crops and I do not call on them. That is understood—they are not to neglect their own crops to go into mine.

Q. I want to ask about the convenience of that method. We have tried it in a small way in New Jersey, and found it did not work, for the reason that on the particular day when we found it necessary to have something done each tenant found that on that particular day his own crop needed precisely the same attention.—A. That might be the case with the white tenants. Mine are colored tenants, and I do not have much of that kind of trouble. They always want work; I can not keep them in work.

Q. Money being scarce, they want money?—A. They want employment. The trouble with me is trying to find work for them. I try to give them what I have. When winter comes and they get out of rations, they come and want credit and want work, and if I can arrange work for them I always do. I have not found them unreasonable. They are reasonable enough with me.

Q. I suppose in that particular feature that the situation is relieved in that the women and children will give their crops the attention needed at that particular time?—A. Yes; women and children work in the field. In fact, I think their husbands make them do a little too much of that.

WASHINGTON, D. C., June 23, 1899.

TESTIMONY OF MR. RICHMAN COLES,

Farmer, Woodstown, N. J.

The commission met at 10.45 a. m., Second Vice-Chairman Gardner presiding. Mr. Richman Coles, of Woodstown, N. J., was sworn and examined as a witness touching agricultural conditions.

Q. (By Representative GARDNER.) You may state your name, residence, and occupation.—A. Richman Coles, Woodstown, Salem County, N. J.; agriculturist, although I am now identified with dairying interests to some extent.

Q. Are you more specially identified with dairying than other branches of agriculture?—A. No.

Q. In a general way what is the condition of agriculture in New Jersey?—A. Well, the condition of agriculture in our section, of course, is not very prosperous, but I do not know that there is any particular complaint that I can make.

Q. In what respects does it differ from former periods?—A. It differs in these respects: The prices are generally lower and wages are somewhat higher.

Q. What are the causes, in your judgment, of the lower prices for products in New Jersey?—A. Our cereal products, of course, have not been in the same demand in foreign countries that they have been sometimes; all other articles are lower in value. I do not know that agricultural products are very much lower in value than productions of other industries.

Q. Has competition increased in your nearest markets, Philadelphia, for instance?—A. Yes; competition is always increasing.

Q. Competition from new sources of supply springing up?—A. From new sources of supply, and if we take the West the low freights will bring it down, so that it does not make very much difference whether we live near the general market or at a distance from it.

Q. Is there any general feeling in New Jersey among farmers that they suffer by reason of low freights for long hauls?—A. There is some feeling that way.

Q. What is the effect, according to your observation, of the continually developing competition from the South on our truck farmers?—A. Among truck farmers there has been quite a good deal of competition felt in that respect. It has hurt our truck farmers quite a good deal.

Q. Is there any competition in the dairy business?—A. Yes; for instance, we are shipping our milk most generally to the Philadelphia market. Part is manufactured in the immediate vicinity, but they are bringing milk from a much longer distance into the Philadelphia market now than heretofore. For almost the same price it costs us to get it 25 miles they will bring it 200—for very little advance in price, and furnish refrigerator cars.

Q. What is the freight on milk from Salem to Philadelphia?—A. Twenty cents a can of 100 pounds—40 quarts—one-half cent a quart; and it is the same all the way to Philadelphia.

Q. In a general way, have you any statement that you could make of the general condition of agriculture in New Jersey; your opinion as to the tendency, whether upward or downward, and the causes for that tendency?—A. I do not know that I would make any extended statement in regard to it. All real estate has been reduced in value, of course, and that seems to make the profits smaller, especially where they contracted for land at a higher price, and now have the interest to pay.

Q. The decline in the price of land has been due to the decline in the price of products, has it not?—A. To a certain extent, but the price of real estate has all fallen at about the same ratio, I think. It would seem so with us.

Q. Is all real estate through your section controlled by the agricultural conditions?—A. Yes.

Q. Salem County lies on the marl belt of New Jersey?—A. Yes.

Q. That has been regarded as one of the richest agricultural districts in the world, has it not?—A. I do not know about that.

Q. And Western competition has driven the Salem County farmer, in a general way, out of the raising of grain, the usual agricultural crops?—A. While they have not abandoned the growing of cereal crops, they are growing less of them than formerly, and have turned their attention to other things. Quite a great deal of berries, asparagus, and tomatoes, for canning and packing purposes, are grown in our county.

Q. As they withdrew from cereals, they turned to small fruits; or those convenient to navigation, particularly water navigation, turned their attention to trucking?—A. To the manufacture of milk in our section.

Q. And has competition caused many of them to withdraw from trucking more and more and turn their attention to milk?—A. Yes.

Q. That is, the new competition from the South?—A. Yes.

Q. So that the New Jersey farmer was driven from growing cereals by the West; is now being driven from trucking by the South, and milk is about all he has left?—A. Milk and cereals, yes.

Q. What is the probable future of that if the refrigerator car and the development of the long haul goes on?—A. We can not always tell what the result will be. It will be necessary to study cheaper means of producing milk. There are no resources left that I know of except to make the milk as cheap as possible; study that part of it.

Q. Is it not presumed that agricultural chemistry has got that down to nearly the bottom?—A. Agricultural chemistry may have, but the farmer does not always follow agricultural chemistry closely in his practice.

Q. What remedies are needed in your opinion?—A. In the first place, we think it is necessary to give agricultural products all the protection that is possible, so that there will be a broader field to work on; import less agricultural products than we are doing now. In fact, nearly everything that can be successfully grown in our country should be encouraged the same as manufactures have been encouraged. We have free sugar, we have free hides; and on the list of imports there are between three and four hundred millions in value of agricultural products that really should be produced in this country. That would help to diversify our agricultural products so that it would be an advantage to us. Our motto has been, as agriculturists, "Give us the same protection that all other industries have in every respect." We would like you to work up the pure-food bill. Every man has a right to make any article that does not injure the community, but he should sell it under its proper name. He should not manufacture oleo and sell it for butter; he should not manufacture articles to mix along with other products and sell them under another name. Our agriculturists are living

fairly well. We have no particular fault to find with regard to it. They might be doing better. But it requires them, as I said before, to study the best possible means to attain the end. That is necessary, I suppose, in all occupations.

Q. What can you say as to the educational facilities in your State?—A. The educational facilities in our State are good. We have excellent public schools, which are all free, text books and all.

Q. What can you say as to the adaptation of the curriculum to the needs of the agriculturists?—A. They need some elements of agricultural chemistry in our public schools. Professor Voorhees got out a very nice little book that is being introduced into our public schools, which will pave the way for higher education in that line.

Q. What is the character of the agricultural labor, generally, throughout south Jersey?—A. The agricultural labor throughout south Jersey is not as good as it was a few years ago on account of the manufacturing associations taking our best help. In our section we depend almost wholly on Southern labor that comes in there. They have better help in some sections than we have.

Q. Is that derived from the permanent population?—A. In some sections of our county they have more of that help, but we have almost none of it with us at all.

Q. That is, the colored population from the South coming north in March, April, and May and going back in the fall?—A. Going back in the fall, some staying all winter. We have considerable colored population right in our vicinity, but it can not be relied on as well as those that come into the neighborhood.

Q. Do you have any difficulty in the fall in holding that help until you are done with it?—A. Sometimes it gets a little difficult. They want to go back home. The worst fault with that help is that though it is fairly trustworthy it is very slow; they have been brought up to slow habits in some way.

Q. If you have almost exclusively that kind of help, you do not meet the question of immigration on the farm among your farm labor?—A. No; although we have considerable help in our section from the intelligence offices in the city; but the majority of it is the Southern help.

Q. Are any immigrants settling and becoming citizens in that part of the country?—A. There are some. Branches of families—a part of them are here—keep coming on and settling with us, but there are very few whole new families that come and settle with us.

Q. What is the effect of that immigration upon agriculture in that section?—A. I do not think that has much effect on agriculture at all, or that it is changing it. There are a great many native-born citizens of foreign parents who are very good farmers and they occupy a great many of our farms now. You understand me—they have not lately come to this country, but were born here.

Q. Why is that—because of greater industry, greater physical hardiness, economical habits of life, or what?—A. They are very economical in their habits, and are most generally very successful.

Q. Work their women on the farms different from Americans?—A. Some of the Germans do; not much of any other. We have only the Germans and Irish with us as a rule. Some of the German women work on the farm; some few of the Irish, not to any great extent.

Q. Are they owners or tenant farmers?—A. They are purchasing. The children of the immigrants are purchasing farms to some extent. A great many of them occupy farms that were formerly occupied by our own citizens.

Q. In your judgment, what is the percentage of foreigners or children of foreigners who own farms, as compared with Americans?—A. A very small percentage of that class of people have farms at present.

Q. They have acquired them, while with the Americans who own farms through your country it is a matter of inheritance generally; not his own efforts, is it not?—A. To a certain extent citizens born of American parents have pretty generally bought their fathers' homesteads.

Q. Have you any instances of American farm laborers whose children have acquired farms by purchase?—A. Yes; we have quite a number of instances of those whose parents were farm laborers acquiring farms of their own at this time. I think it is possible to buy a farm and live on it comfortably and pay for it at the present price of land.

Q. (By Mr. KENNEDY.) Are there any abandoned farms in New Jersey?—A. They say there are, but I do not know of any; none in our section.

Q. (By Representative GARDNER.) What are the selling prices of farms through Salem County generally now—sales occurring mostly, I suppose, in the settlements of estates—public sales?—A. They run from \$40 to as high as \$80. Of course I mean tillable land.

Q. In a general way, how much does the prevailing price of farms exceed the

cost of the buildings?—A. There are a great many of them that will not sell for very much more than the buildings really cost. They were built at the time of high prices. You can put up a new building now a great deal cheaper than you could a few years ago.

Q. What elements are cheaper?—A. Lumber is much cheaper than it was a few years ago.

Q. What has the decline of prices of farms amounted to in the last 12, 15, 20, or 25 years in your section?—A. The decline has been about 50 per cent from its highest prices.

Q. Is there any colonization of foreign population with you?—A. No.

Q. And the only immigrants you have are of German and Irish extraction?—A. Yes. There are several Jewish colonies.

Q. How do the wages of farm laborers compare with former periods, 10, 15, or 20 years ago?—A. They are no higher than they were 10, 15, or 20 years ago.

Q. Are the hours of labor longer, shorter, or the same?—A. The hours of labor have a tendency to grow shorter.

Q. What is the cause of that?—A. To a certain extent it is because the hours of labor have grown shorter in other pursuits.

Q. What are the wages of farm laborers in your section, say the maximum for a good man and the minimum for a poor one?—A. The maximum is \$20 and board. Not very many get that, but there are a number from that down to \$12, and \$10 for office hands—hands employed through intelligence offices.

Q. Is there a difference in wages in the different branches of agriculture?—A. Always a little higher prices are paid for wages among the truckers. The season is short, and they generally pay a little more wages.

Q. They have to work without regard to hours?—A. Yes.

Q. By steamboat and train schedules?—A. Yes.

Q. What is the system of payment of wages?—A. By the month, cash payment.

Q. Is there any of the old system of tenant farming on shares left in your section of New Jersey?—A. Yes; quite a good deal.

Q. What are the terms on which it is conducted now?—A. Generally, if the farmer owns the stock, they farm for one-half, and find half the seed, and generally one-half the commercial fertilizer, but not always so.

Q. How is it where the owner owns everything and the tenant furnishes only the labor?—A. One-third.

Q. Has there been any change in these terms in any period?—A. I do not think there has been any change in these terms; it has always been customary; but since they have been dairying so much (heretofore they only gave the owner one-half of the farm products and kept the stock), since they have got to keeping so much stock, the owner of the farm gets part of the stock, has an interest in that also—I mean the cows.

Q. What is the tendency of agricultural labor, and more particularly the children of farmers, as to remaining on the farm or leaving it for other occupations?—A. A great many of them leave the farms, but our farms are all occupied. If a farmer has 2 or 3 sons, unless he cuts his farm up or buys his neighbor's farm, he can not find room for all his sons.

Q. Some of them must get out?—A. Such as have a tendency for other occupations; but, so far as my observation goes, only now and then one who leaves the farm and engages in other occupation succeeds better than the one left on the farm.

Q. What is the effect of improvements in agricultural machinery upon the number of men employed in agriculture; to have the same amount of labor done and the labor diminished, or does it result in more extensive cultivation or the cultivation of wider areas and hence require the same number of men?—A. It has been the cause of more diversified crops.

Q. What is the general condition of the farmer now, as to his mode of living, general home comforts, interest in literature, etc., as compared with past periods 10, 15, 20, or 25 years ago?—A. His home comforts are continually growing greater. His enjoyments are greater than they have ever been since my knowledge of life.

Q. Are his children better educated than formerly?—A. His children are better educated, because we have excellent public schools. Some are going away to school.

Q. After the public schools, do a greater part of them go away to the normal schools or other places for higher education?—A. I do not know that any greater number of them go away, unless they want to teach; then they go to normal schools. Of course some go off to college; not very many of them; more than did formerly; but our public schools and our high schools are so much better qualified that they do not feel the necessity, unless they want to study a particular branch for a particular occupation.

Q. Does your county send a certain number of graduates, say, two a year, to the agricultural college?—A. Some go, but I do not think the county keeps up its quota.

Q. Do those who go return to the county as teachers and teach agriculture, return to the farm, or go on acquiring a higher education and disappear?—A. Some of them return to the farm, and some have gone on to a higher education and found business more profitable to do.

Q. The influence of the agricultural college on farming in your section is felt many fold greater by the influence that it has on farmers, and the information which it disseminates?—A. Than the education of our sons, yes.

Q. The price of the land having diminished one-half, as you said, has the increase of stock and modern implements equaled that, or has the general result, in your opinion, been a decline in the amount of capital employed?—A. I think the increased amount of stock in our section has brought the farm and its equipment up to a greater value, almost, than it was during the higher price of land.

Q. There are certain transportation lines between Philadelphia and various points in south Jersey, are there not, that are almost entirely sustained by the carrying of agricultural products to market?—A. Yes.

Q. Then, besides the amount of capital employed in agriculture directly, under the head of transportation there is a good deal of capital employed by agriculture?—A. Yes.

Q. How do you think the aggregate earnings of the capital employed in agriculture in your section compare now with 40, 30, 20, and 10 years ago?—A. There have been some periods within the last 50 years when we depended largely upon cereal crops, and there were years when the aggregate earnings of the farm were greater than at present.

Q. How about the percentage of profits on the capital employed?—A. Well, I do not think that the percentage of the capital employed is as great as it was in former years. Our labor costs us more. While it is not very much higher, we do not get the same quality of labor, and the amount of work we get out of it costs us more.

Q. You stated that wages had not increased. Do you mean that wages by the month have not advanced, but wages in proportion to the amount of work done have advanced materially?—A. Yes; that is what I mean.

Q. Have you anything to say as to taxation of agricultural property in New Jersey?—A. As well as I am acquainted with the laws, our tax laws are about as equitable as we can get them. Some officers, in carrying them out, do not properly do their full duty. Everything in agriculture can be seen by the assessor. In some other occupations they are able to hide some of it and it is not all taxed. Some of our assessors do not do their full duty that is required of them by law, so that sometimes, in some sections of the country and some sections of the State, taxes are not equalized properly.

Q. Is it true, as to Salem County, that a great many agriculturists have property outside of their agricultural interests?—A. Yes; a great many have.

Q. They are the owners of the hideable kind?—A. I do not know that it is any more so than the other counties throughout the State.

Q. What have you to say as to the organization of agriculturists?—A. The organization of agriculturists has been following after the same plan as all other occupations that were organized, probably not with as good success as some others, but it was simply for their mutual benefit.

Q. Has benefit resulted from the organization?—A. Yes; there are always some benefits resulting from an organization if it is carried on in a proper manner. It gives the members within the organization some ideas and some protection against others; some idea of how their own occupation is coming along; and they can cooperate together to a certain extent to their advantage. I might say that they do not cooperate together as well as those of a great many other occupations.

Q. Has, in your opinion, the agricultural college with the experiment station in New Jersey been of great benefit to the farming interests of the State?—A. It has been a great benefit to the farming community. I suppose one-half of our farmers do not realize it, but it has benefited them almost as much as those who have realized it and who have taken an interest in it.

Q. (By Mr. KENNEDY.) Can you tell us something about the milk trust formed by the New Jersey farmers?—A. I think there is no milk trust in our section of the State.

Q. Have they not joined with others in the upper section of the State?—A. I do not know anything about that at all. I simply saw that in the American Agriculturist and other papers.

Q. (By Mr. FARQUHAR.) What class of farming business pays in your section of New Jersey?—A. It is an old saying, not to put all your eggs in one basket, and

diversified farming is more sure of success, we think, and I guess everywhere else, although there are some sections of the country, for instance, in Dakota, where they can only raise 2 or 3 crops; but in our section we can grow almost anything that is suitable for our climate, and if you have them grow along all through the season and all kinds of crops, if the season affects one probably they will be successful in the other.

Q. In your crops have you much competition from the South?—A. In early potatoes, yes. We grow a great many early potatoes in our section; 12, 15, to 20 acres on a hundred-acre farm are grown each year.

Q. Is Philadelphia your permanent market?—A. That is our market. We have shippers who ship direct to New York and Boston; also along our river border, along the Delaware; they go over to Wilmington and Chester. From our section the main bulk goes to or through Philadelphia.

Q. Is the percentage of the selling price of products as much as 50 per cent lower than 20 years ago?—A. No. The selling prices of agricultural products are somewhat lower than they were 15, 20, 25 years ago, but there has not been so much depreciation in that as on the land.

Q. Is the competition against your farm products regular or sporadic—changes by seasons?—A. It changes by seasons; for instance, there is a Southern market; if the early crop gets cut off and is not successful, or even if we can have their crop early at the proper season when nothing stops its growth, the glut of the Southern stuff will be over before ours is ready for market, and it is better for us; but if there is delay by cool weather and the glut comes in about the time ours comes in, it makes it pretty hard for us.

Q. Does your section make many sales in the New York market?—A. There are dealers there for the New York market.

Q. Do you make any sales farther north than that in New York State and in Pennsylvania?—A. Yes; there are early potatoes and watermelons shipped all through northern Pennsylvania and New York, and on to Boston.

Q. Are there many engaged in truck farming in your section?—A. Not in our immediate section, but in our county, over between a few miles west of us and the river, and I suppose about 6 miles from the Delaware River and back, it is all trucking and sweet potatoes.

Q. Is that carried on by native Jerseymen?—A. By native Jerseymen, to a large extent.

Q. What is the average wheat crop in your section?—A. I think the average last year was placed at 18 bushels, and the year previous to that, I think, 22 bushels.

Q. You have about the best farming land in New Jersey in that section?—A. We have some pretty good farming land. Some of our brothers from the upper end of the State think they have some very good, too.

Q. What has been the average price of wheat there for the last 4 or 5 years?—A. At present it is about 85 cents; last summer it was about 75 cents; the year before it was somewhat higher, and the summer previous to that it was down to about 65 and 60. The average price for the last 3 years has been advanced over what it was some years previous.

Q. Do you regard that the growing of wheat there is a paying crop?—A. No. It is sometimes necessary that we should grow it on account of the straw. Some say it is a paying crop on account of the straw, although some do not regard it as such. They think they can get along without straw, to a great extent.

Q. Are commercial fertilizers in general use in that section?—A. They use a great deal in our section. Of course, where we have large dairies we make a great deal of homemade manure.

Q. Do you think that possibly the college and experiment station and the general knowledge you gain through farmers' associations have given you an advantage in caring for your manure and determining the plant food for the farm?—A. And also given us a higher grade of fertilizer.

Q. (By Representative GARDNER.) The practice is to sow wheat after early potatoes, is it not?—A. Yes; and other truck crops.

Q. And for these crops you fertilize heavily?—A. Yes.

Q. So that that crop of wheat grows on soil that has been heavily fertilized?—A. Yes.

Q. What would be the crop as near as you can guess at it if you were to follow the method of the Dakotas, say, and grow 12 consecutive crops of wheat without any fertilizer at all?—A. I know it is stated that wheat does not impoverish land very fast, but I do not think we have any land in our section that would grow 12 consecutive crops to any advantage whatever unless it was fertilized.

Q. If a crop following your potatoes yielded 22 bushels per acre, the first crop, what would you anticipate as the yield of the twelfth crop without any fertilizer? Would you expect anything worth harvesting?—A. I would not suppose there

would be; but I knew an old acquaintance—we think that is very hard on land—who had a small lot in a village not very far from us, and he grew corn on it continually for years. He husked the corn out and cut the stalks down and let them lay on the ground. In the spring he took a hoe and chopped these stalks up and plowed them under, and he went on for 12 or 15 years to my knowledge and raised good corn; but I do not know what would be the effect of the wheat crop. If the wheat and straw were all taken off, I think it would reduce it fast.

Q. To prolong that grain experiment you would have to return the straw and turn it under, would you not?—A. Yes.

Q. (By Mr. A. L. HARRIS.) How much fertilizer do you apply to the acre on an average for early potatoes?—A. We do not apply in our section more than 700 or 800 pounds to the acre for early potatoes. There are some sections where they put on 1,000 pounds.

Q. What kind of fertilizer is that?—A. Of course there are different fertilizers. There is a good deal of nitrogen in it.

Q. Superphosphate?—A. Some superphosphate with it.

Q. How much is that worth per ton?—A. From \$20 to \$25.

Q. How many bushels of potatoes do you grow on a field after that treatment?—A. There should be from 150 to 200 bushels per acre. Such a season as this we will not get very much.

Q. Where do you market those potatoes?—A. They are bought up in our vicinity and shipped to Philadelphia and on.

Q. What is the average price?—A. When they first commence to dig them they get probably \$3 a barrel.

Q. How many bushels in the barrel?—A. About 2½ or 2¾—175 pounds.

Q. About \$1 a bushel?—A. And from that on down to \$1 a barrel.

Q. (By Representative GARDNER.) Does not a barrel hold 25 half pecks?—A. The dealers are very apt to get the barrels a pretty good size when they are buying them by the barrel.

Q. Does not a full barrel arranged for heading with cloth hold 25 half pecks?—A. Yes.

Q. Three bushels and a half peck?—A. But there are not 25 half-peck baskets nowadays; they will not hold 25 half-peck baskets.

Q. (By Mr. A. L. HARRIS.) Do you sell by weight or measure?—A. Pretty generally by the barrel.

Q. Range from \$1 to \$3 a barrel, according to the season?—A. Sometimes they go lower than that.

Q. How much on an average do you get per barrel, taking the season through? On an average, do you get \$2 a barrel?—A. Not very much more than \$1.50.

Q. That would be in the neighborhood of 50 cents a bushel?—A. Yes.

Q. Do you plant with a machine?—A. Pretty generally now.

Q. Do you till with the improved plow?—A. We have not any improved plows with us. We use the cultivator and the gang plow some.

Q. How do you dig them?—A. They are most generally plowed out with a potato plow, a plow made for that purpose; sometimes use the diggers, but not very much, in our neighborhood.

Q. That crop is a profitable crop, is it not?—A. If we can get these prices, a good season, and a good crop, it is profitable. We look upon growing early potatoes very well.

Q. Your fertilizer is well paid for by the potato crop?—A. Yes.

Q. That is followed by the wheat crop?—A. Yes.

Q. Then what follows?—A. Grass.

Q. What kind?—A. Clover and timothy.

Q. What is your object in sowing clover?—A. The first year we mow it and the second year we pasture it generally.

Q. What effect does that have upon the land?—A. Clover enriches the land; it always does it good. Timothy is a little harder on the land.

Q. Under that treatment is your land improving?—A. Our land is improving if we have plenty of stock, but just with the fertilizer alone it does not improve very much.

Q. What becomes of your wheat straw?—A. It is converted into manure.

Q. What becomes of that?—A. That goes on the potato crop or on the land.

Q. That is one of the means of improving the soil?—A. Yes.

Q. Do you raise any corn?—A. Oh, yes; corn is planted in clover sod with us.

Q. What yield do you get from corn, on the average?—A. On our best land, 60 to 70 bushels; sometimes more; our poorer land, 40 bushels—shelled corn.

Q. What do you do with that corn?—A. We are generally supposed to feed it out.

Q. In your feeding how much do you get for that on an estimate?—A. We would be supposed to get a little over the market price, although part of this corn has to go to the horses to do the farm work.

Q. How much is the market price of corn on an average?—A. It has been for some years ranging from 80 to 85 and 88 cents a bushel.

Q. You convert a part of your straw into manure. What kind of stock do you feed it to to convert it into manure?—A. In our section usually to milch cows.

Q. Do you raise any beef cattle?—A. There are a few, but very few now.

Q. Are they profitable?—A. Not very profitable of late.

Q. About how much do you get for your beef cattle on the hoof?—A. From 4 to 4½ cents.

Q. Is that profitable?—A. If we do not have to pay too much for them; we have to buy them, you know.

Q. Suppose you raise them and sell them for 8-year-olds at 4½, is that profitable in your county?—A. We think it more profitable to raise heifers; the heifer at 3 years old is worth a great deal more in our section.

Q. Is there any other stock that you raise?—A. We raise some few hogs. There are a great many colts raised in our section. They were so low a few years ago that that industry seemed to drop off, but this last year or two they are coming to it more.

Q. How much is a good, average horse worth now?—A. A good, average horse is worth from \$80 to \$90.

Q. Does he pay for his raising at that price?—A. I have my doubts. They are looking for something fast nowadays.

Q. Do you raise any mules?—A. As a rule, none. I know of a few young mules, but very few.

Q. I would judge from your testimony that farming is fairly profitable in your part of the State?—A. It is fairly profitable at the prices we can buy farm land at now.

Q. Is there not such a thing as land becoming too high for farming purposes, taking the investment into consideration?—A. Certainly.

Q. And your land is still higher, taking the present dollar into consideration, than the product?—A. I think our product is fully as high as the land, taking the purchasing value of the dollar into consideration.

Q. Take an 80-acre farm; what, in your estimation, as a rule, is the profit outside of the satisfaction and comfort of having a farm highly improved?—A. What I mean to say is this: That you can buy a farm at present prices, and with careful attention and close economy you can live fairly well on it and pay the interest on the money.

Q. Suppose you take a small capital and invest it in a manufacturing enterprise. On an average would that pay a better per cent, all things considered, giving the farm credit for all that it should have credit for, than the same investment in agricultural lands?—A. It might. It would depend on whether you were manufacturing a patented article, or something under great protection.

Q. As a rule, are the farmers as prosperous as those who have their money invested in other lines of industry; mercantile, manufacturing, or even banking?—A. Well, we think that banking is the best business there is nowadays.

Q. Are there any failures at that?—A. We have not had any in our section.

Q. Have you any failures in agriculture in your section?—A. Yes; we have them sold out by the sheriff occasionally.

Q. Careful, prudent, energetic farmers, were they?—A. They thought they were, but the great majority of them have been dragged down by the load of years ago, buying at high prices.

Q. You speak of the comforts of the farmer at the present time. I wish you would describe a little further what you mean by those comforts.—A. The farmers in our section—the most of them—have fairly good homes; they have horses and carriages, and they live about as well, generally, as other people. They have a right to live better, because they can grow everything on their farms fresh. Their labor is very severe and very trying. Our milk farmers do not have any rest—7 days in the week, 12 months in the year.

Q. Have you any of the luxuries that the manufacturer or the banker has? I am speaking now in regard to musical instruments, or equipments of that kind.—A. I do not know of any farmers around, where there is any talent for music, where they do not try to have a musical instrument in the house.

Q. Does that go to the dignity of a piano?—A. Most generally an organ, but there are a number of pianos, of course—a great many of them.

Q. (By Representative GARDNER.) You were asked what fertilizer you put on a field of potatoes, and you answered from 800 to 1,000 pounds to the acre. What

do you put on that land besides that commercial fertilizer for that crop?—A. All our barnyard manure is put upon the quantity of land that is farmed that year.

Q. When you plant the field of potatoes, you fertilize highly with a view to follow with grain and grass?—A. Yes.

Q. About how much to the acre do you put on—of barnyard manure besides the fertilizer?—A. We do not get on as much per acre as formerly, because with our best farmers their cornstalks are cut up and fed through the stables, and do not make near as many loads as it used to when they hauled it long.

Q. How many loads per acre do you like to put on besides the commercial fertilizer?—A. Eight to 10 loads; 6 to 8 loads, anyhow.

Q. (By Mr. FARQUHAR.) Is that plowed in?—A. It is plowed in, as a rule.

Q. (By Mr. A. L. HARRIS.) Do you use a spreader?—A. There are a few used, perhaps, but it is generally spread by the fork; and we largely haul that manure out in the winter season when there is snow on the ground.

Q. Have you ever used a spreader?—A. None ever used on my farm, though there are spreaders around there.

Q. Have you noticed the effect of the spreader compared with the spreading by hand?—A. I think if the manure is long the spreader is an advantage, but I think as short as most of the manure is now we can spread it just as evenly with the fork as with the spreader.

Q. (By Representative LIVINGSTON.) You said a while ago the agricultural colleges benefited your farmers; how?—A. Yes; those who have followed it closely and been associated with the directors of the experimental stations have been benefited. And another reason is that they have forced the manufacturers of commercial fertilizers to give us a better grade of fertilizers for the money.

Q. From what source do you get your nitrogen in the fertilizer?—A. From several sources. We sometimes get it from fish and sometimes from nitrate of soda; we use some of that; we use muriate of potash.

Q. What do you put nitrate of soda into?—A. Acid phosphate.

Q. Do you have beds of it up there?—A. No, we have no beds of acid phosphate there.

Q. What does that acid phosphate cost you laid down in New Jersey?—A. I think it cost us \$9 this spring, ground and put in sacks.

Q. What does your State law require that acid to analyze up to?—A. I do not think there is any State law on that. It has to prove itself to be what it is marked.

Q. Suppose it is marked 12, 10, or 20 per cent phosphoric acid, how do you know if you have no inspectors of fertilizer, and no law?—A. We know. All we have to do is to send a sample to the experimental station and they will return an analysis.

Q. Did you ever try the simple plain acid phosphate?—A. No.

Q. What per cent of ammonia does your fertilizer contain?—A. I have not the figures here at present. I buy the ingredients and mix them myself.

Q. Do you subsoil?—A. No.

Q. On that clover sod, when you turn it down, how deep do you run your plow?—A. Six or eight inches.

Q. How many horses?—A. One or two.

Q. What is the average size of your farms in acres?—A. I think the average size of the farms in our county is a little less than 100 acres.

Q. You are all small farmers?—A. Yes, we would be called small farmers in some sections.

Q. You said a man could buy your Jersey farm, and if he was economical and industrious he could make a fairly good living and pay the interest on the price of the land?—A. Yes.

Q. When will he pay the principal?—A. He might be working it off a little at a time.

Q. You think it would be a pretty hard job, do you not?—A. Yes.

Q. What is there in the condition of your State that a man can not pay for the land? I suppose that the rate of interest is a little too high?—A. 6 per cent; and taxes are not very low.

Q. Do banks bear their proportion of taxation in your State on the money they use during the year?—A. We do not know what they do. They ought to, according to law.

Q. What time do you give in taxes in New Jersey?—A. In our county we give them in along in June and July. There are some counties that give them in in May and June.

Q. There is nothing else but the high rate of interest and the burden of taxation on real estate that holds your farmers back from buying and paying for land

at the present prices?—A. I do not wish you to understand me to say that. We need more protection than we have at present.

Q. Protection of what kind?—A. We need to have a higher protection on wool, and we need to have a higher protection on hides. The manufacture by the farmer of wool and the growing of hides is as much an industry as to prepare it and manufacture it into fabrics and should be protected the same.

Q. You mean the raw wool and raw hides?—A. Yes.

Q. How could that help you unless you are a sheep-growing and beef-growing people?—A. We would be greater sheep growers and beef growers if we had that protection.

Q. When you did have that protection in years gone by your farmers were in no better condition, were they?—A. They consider now that they were, years ago.

Q. (By Senator MALLORY.) Will you state what the rate of taxation is in New Jersey on real estate? You have no state tax, I believe?—A. Only the State school tax of about 20 cents on the hundred. Our State school tax last year was 28; our county tax 82. Township taxes vary.

Q. Have you any idea of the average?—A. In our township where I live it was 98 altogether.

Q. That includes road tax?—A. Everything. Some sections are 120; other counties, where they have been building stone roads, have got up to over 200.

Q. You have no idea what would be the average tax; not less than 98?—A. There is no township in our county that has a smaller percentage of tax than our township.

Q. Do you think 150 would be the fair average; between 200 and 98, say?—A. 150. We have not had any of that excessive taxation for stone roads in our county.

Q. Please state, to the best of your judgment, as a man of experience, in New Jersey, what is the average tax in the State? You put two figures, 98 and 200.—A. Well, in the absence of the comptroller's report, which would give the exact figures in every township, I should say 150 was high. Some of the cities are very much higher than our country districts. I should not think the average would reach 150 for the country districts.

Q. How is it you have no State tax?—A. The corporation tax—the corporations pay our State taxes.

Q. The organization of corporations?—A. The corporations—the railroads and other organized companies.

Q. Are they subjected to the tax that everybody else is subjected to?—A. They pay direct to the State.

Q. They do not pay any county or township taxes?—A. Very little. There is a little that is paid into the State and goes to the county.

Q. You mean there is an assessment on railroad property on which a tax is paid direct to the State?—A. Yes.

Q. Who makes that assessment?—A. The State board of assessors.

Q. Who assesses that county tax?—A. The board of freeholders fixes the county tax.

Q. Do you assess the railroad property going through the county?—A. That is done entirely by the State board.

Q. In other words, all corporate property is assessed separately and distinct from the property of everyone else?—A. Yes.

Q. And that suffices to pay all of the expenses of the State, including the legislature?—A. Yes.

Q. To what extent are you able to raise feed for your dairy cattle on your farm, and what proportion must you buy outside?—A. We make an effort to raise everything on the farm excepting a certain quantity of wheat bran.

Q. Do you raise wheat yourself?—A. Yes; but we sell that outright. We could not sell the flour to advantage.

Q. Do you use cotton-seed meal?—A. Some do, to a small extent.

Q. That has not been coming into vogue?—A. Yes; it has come into vogue, but some of them have thought that the stock received some injury. It has to be fed very carefully, we think. We may be mistaken.

Q. What constitutes the principal food of your cattle during the spring and summer months?—A. As soon as they get out on grass we do not give them very much feed; just a little to entice them in, until it gets dry like it is now, and then we give whatever we have. We try to plant corn early so as to have corn as long as possible. The season has been so dry that we have not very much yet, but it will soon do to work on. Until a couple of weeks ago we had ensilage for ours. We had been feeding that. We do not use it in the winter and spring before we turn them out.

Q. Do you furnish any ruta-baga turnips or anything of that kind?—A. Some are grown in our section, and sugar beets also.

Q. In the winter what do you feed them on?—A. We have the silo, and we cut our corn into ensilage, ears and all. That gives us a very good feed; and then we use some bran with it. Some also use what is called gluten feed.

Q. (By Representative LIVINGSTON.) Have you ever used cotton-seed hulls?—A. No.

WASHINGTON, D. C., June 23, 1899.

TESTIMONY OF MR. SAMUEL B. KETCHUM.

Farmer, Pennington, N. J.

The commission met at 10.45 a. m., Second Vice-Chairman Gardner presiding. At 2.04 p. m. Samuel B. Ketchum was sworn, and testified as follows:

Q. (By Representative GARDNER.) You may state your name.—A. Samuel B. Ketchum.

Q. Residence?—A. Pennington, N. J.

Q. Occupation?—I have been a farmer all my life until within the last 4 years. My occupation is now more that of trust officer; looking after estates in my charge.

Q. What is the kind of agriculture mostly pursued in the vicinity of Pennington, Mercer County?—A. Generally mixed agriculture—potato farming and dairying.

Q. Truck farming specifically is not much developed there?—A. Not there. In the lower part of the county—there is more trucking south of Trenton.

Q. As to that locality, what is the condition of agriculture now as compared with former periods, say 20 years, or as far back as your memory carries you?—A. To go back 40 years, I think farming compares with what it was then. Take a period following the civil war for several years, farming generally is not as good as it was during that time. For the last 10 years it has been about on a par with what it was before the civil war.

Q. Has there lately been any material decrease in the number of acres under cultivation?—A. No. Lands have been all occupied and new lands have been cleared up.

Q. As to the number of people employed in agriculture, has that decreased because of the new machinery, or for other reasons, or has it increased because of the more intensive system of farming, or is it comparatively stationary?—A. I think the amount of labor employed is about the same as it was 30 to 40 years ago, because the lands have been developed, wet lands have been reclaimed by underdraining, timber lands have been cut off, more acreage has been brought up, and then our machinery has brought a more intensive farming, more thorough farming, so that we employ the same amount of labor, I should judge, as we did 30 to 40 years ago.

Q. Does the advent of the commercial fertilizer permit you to cultivate each year more acres than you could previously when you had to rely upon your own barnyard manure?—A. Yes.

Q. From where do you get your farm labor?—A. In parts of the county we have some foreigners—a few Italians, men of that class—but the largest part of our labor that comes from out of the State is from southern and southwestern Virginia.

Q. What percentage would you estimate of your farm labor do you employ the year round?—A. I think about three-fourths might be classed as permanent labor the entire year. The balance comes largely from southwestern Virginia.

Q. The permanent as well as the transient is from Virginia?—A. Yes.

Q. Then very few of your young men engage in the vocation of farm laborers?—A. Comparatively few. Of course there are some. Suppose a man has a farm of 100 acres and needs 4 men; he may have a son, and he and his son will employ 2 men. It is owing to the nature of the farm. In the southern part of the county, where it is trucking alone, he needs more help in the summer than in the winter. In the north, where it is general farming and dairying, especially dairying, he needs the same amount of help in the winter as in the summer.

Q. What proportion of the farms of your county are devoted to dairying?—A. On a rough estimate, I should say one-half now make dairying rather a specialty.

Q. Where do you market the product?—A. A great deal at Trenton. Within perhaps a radius of 6 miles most of it goes to Trenton in the form of milk.

Q. What are the prices of milk in Trenton?—A. About 6 months wholesale prices will be 4 cents and for the remaining 6 months 3 cents; double that for retail.

Q. Where do truck farmers market their product in that section?—A. Mostly at Trenton. The dairymen that live outside of hauling distance from Trenton, most of them, ship to Philadelphia.

Q. You have a milk train running to Philadelphia every morning?—A. Yes; right through every day.

Q. Do the young men who grow up in that section remain on the farm, or is a tendency to leave it noticeable?—A. The tendency with our brightest, best young men is to leave.

Q. Where do they go and what do they engage in?—A. Usually go to Trenton. Some enter professions, some mercantile pursuits; some one thing, some another.

Q. Can you give the reason why they seek to escape the vocation of agriculture?—A. Various reasons are given. A good many think it is too slow a way of making money, and some think it is too laborious, and the difficulty that has been experienced in getting good reliable farm labor has led a good many to give it up.

Q. The difficulty of getting good farm labor is an element of discouragement of agriculture?—A. It has been one of the difficulties.

Q. What are the prevailing wages paid farm labor through that section?—A. As near as I know, from \$10 to \$20 a month and board.

Q. (By Mr. KENNEDY.) Does the negro labor that comes from the South readily adapt itself to the improved machinery used in agriculture in New Jersey?—A. No; not many of them.

Q. You do not put them to using machinery?—A. No, but very little—that is, intricate machinery like a binder or anything like that—unless there is someone in the field who can look after it if anything gets the matter with it.

Q. (By Representative GARDNER.) Do you find a percentage of these people can run a mowing machine all right?—A. They can drive a team all right and if nothing gets out of condition they can run a mowing machine.

Q. Can they run a corn planter?—A. I would not want to trust one with a corn planter unless he had been North a year or two.

Q. Does that labor stay North after it leaves the farm, or return to Virginia each fall?—A. With us perhaps the first year or two they will return South about Christmas. We also have a good many female servants from the South, and a great many of them, after being there a couple of years or so, get married and live there permanently. A good many are with us now permanently.

Q. Does the farm labor which you bring up from Virginia remain farm labor, going South in the fall and coming back again in the spring, or does it get acquainted in the North and leave the farm and go into some other vocations?—A. No; I do not know of their going into any other pursuits.

Q. If they come in the spring and return in the fall annually they soon become experienced?—A. Yes; they will. As I say, I would not want to trust them with machinery the first year.

Q. Do you find that those who go South and return, as a rule, return the following spring to the same neighborhood, or do they prefer to get into some other neighborhood?—A. They generally come to the same neighborhood.

Q. Then you get the advantage of the experience that they get on your farm?—A. Yes.

Q. (By Mr. KENNEDY.) Can you state approximately how many of these colored laborers come into your county?—A. No; I could not.

Q. Do they come there by the hundreds?—A. I would not want to say how many hundreds there were on the line of the Philadelphia and Reading Railroad. They frequently come up the 1st of April, and when they get to Trenton Junction there will be almost a car full. By the time they get to Bound Brook they will scatter out at the different stations.

Q. They do not all come at the same time?—A. Not all; but they try to make it a point to be there and go to work the 1st day of April. That is the time of employing help in our section.

Q. You think that many thousands of them come to New Jersey to work as farm laborers?—A. I am not acquainted with the different sections of the State sufficiently to answer that question. If the proportion was the same all over the State as it is in Mercer County, I think it would be perhaps two, three, or four thousand.

Q. (By Representative GARDNER.) When they leave you in the fall and return in the spring, how do they employ; do they correspond with you and employ again directly in the spring, or do they come on to the cities and report to the intelligence offices and get work there?—A. Very few of them are hired through the

intelligence offices. Many of them are employed for the next year when they leave to go South in the fall. If one man is South and coming North in the spring, and he has brothers or one or two friends that want to come North, he sends word to his employer that if his neighbors want hands he will fetch them up.

Q. (By Mr. FARQUHAR.) Is this immigration caused by the lack of white help in your section?—A. The cause of our employing them is the lack of good white help. They are preferable to the foreigner, whom we can not understand and who knows nothing of our ways.

Q. Are there any foreign immigrants that make application for labor in your section?—A. None on the farms that I know of.

Q. How long has this been the practice, the hiring of this colored help?—A. As near as I can tell, it started somewhere, perhaps, about 7 years ago in our section and has been increasing.

Q. (By Mr. KENNEDY.) There must be considerable inducement in the way of increased wages to bring them up from Virginia. Do you gather from them what the difference in wages in the two States is?—A. Well, I have heard them speak of the wages they received at home, but I never put a great deal of confidence in what they said about their wages. There are conflicting reports.

Q. (By Representative GARDNER.) What is the state of literacy among them, if you have observed?—A. Those that I have had employed, both male and female, can read moderately well, and several of them that I have had can write so that you can understand their writing. Their attainments that way compare very favorably with the native colored people we have there, who have the benefit of free schools.

Q. Is the method of farming on shares in vogue to any extent now?—A. Yes; quite extensively.

Q. On the usual terms of one-half or one-third, according to the stock?—A. Yes.

Q. Foreign immigration you have practically none?—A. Very little in our immediate section.

Q. What are the school facilities in your section?—A. Good.

Q. Does it, in your judgment, need adaptation to the needs of agriculture in the agricultural schools?—A. I do not think there is any particular need of that. I am not an enthusiast on introducing the elements of agriculture in our general public schools, for the reason that the majority of our public schools, even in the country, are located in villages and towns where the school is perhaps made up of as many pupils who are not the children of farmers as of those who are. It may be a good thing, but I have not been an enthusiast on introducing that element.

Q. What is your opinion as to the earnings of capital employed in agriculture as compared with former periods, taking the farms at their present value?—A. Going back to 1860, I think it would compare very favorably. To go back to 1865, to 1875, or on later, it is not near as good as that period was.

Q. What have you to say of the taxation of agricultural property in your county?—A. In our township our rate is almost $1\frac{1}{2}$ per cent; it varies from 1.38 to 1.40 or 1.45.

Q. How does that compare with the rate in cities—Trenton, for instance?—A. Trenton, I think, is about $2\frac{1}{2}$.

Q. Do you know of the comparative valuations of country and city property?—

A. The valuations of farm land in the county are higher in proportion than the city property.

Q. Does the New Jersey farmer yet reconcile himself, in fixing the value of his property for taxation, to the shrinkage that has taken place since the war?—A. He does not, especially if his farm is for sale and he wants to sell it.

Q. Does or not, in your judgment, the hardship of taxation result to the farmer by his own persistence in putting a value on his property that he knows to be higher than it would exchange for?—A. I think in some instances it does.

Q. In cities the price fixed is usually the selling price?—A. In Trenton they have a board of assessors. In the country the valuation is fixed by the local assessor, who is elected by the people, and some farm land occasionally will be rated too low, according to location, especially if the assessor wants a vote next time.

Q. Is there or not a prevailing thought that they can not afford to have their farms assessed as low as they believe they would sell for if put up at public sale?—A. Yes; especially if they have in view the selling of their farms. Of course they do not want the price put down on the duplicate.

Q. There has been a material decline in the prices of agricultural products, has there not, within 20 years?—A. Yes.

Q. To what cause do you attribute that?—A. The prime cause I attribute to overproduction. The supply has been greater than the demand.

Q. What had, in your judgment, the prices of the period of which you speak that resulted in booming farm land to do with stimulating that overproduction?—A. The high prices of farm products some 80 or 40 years ago led to the opening up of the immense territory of the West. The markets of the world were ruling high prices at that time and we were enabled to get high prices for all we exported; but it led Russia to develop and England to develop, and altogether after a while we got an oversupply.

Q. What has been the decline in the value of agricultural lands under that process in your vicinity?—A. From one-half to two-thirds almost, with the exception of choice farms—choice locations near the city.

Q. Are choice locations near the cities peculiarly available for dairying and trucking?—A. Yes; there is this advantage: A farm lying within 4 or 5 miles of Trenton will bring much higher prices than 10 miles from Trenton, even if not very productive, because the farmer looks up his customers and takes his milk into Trenton and retails it. He gets 6 and 8 cents a quart—all there is in it—and at the same time he can do a great deal of huckstering of potatoes, eggs, etc., that they grow on the farm; takes them along in the milk wagon, so that he gets all there is in it. It makes that farm worth almost double, in many instances, what it would be 10 or 15 miles away.

Q. The special value of these farms results from conditions under which they can devote them not alone to agriculture, but they offer facilities of entering into retail trade with their products?—A. Yes; and having a local market which they can reach that way.

Q. Is there a decline in the productive condition of the soil in New Jersey, in your judgment?—A. No; I do not think there is.

Q. You think it is being kept up?—A. Yes; that is, the most of farms. Of course there are exceptions.

Q. What have you to say as to the organization of agriculturists?—A. I think farmers' organizations are a good thing and have been of great benefit.

Q. The farmers' organizations have then in New Jersey been a means of dissemination of information, derived from the agricultural colleges and other sources, among your farmers?—A. Yes; they have been of great benefit in that line.

Q. Have they, in your section, been of any advantage in marketing crops?—A. No particular advantage in my section.

Q. Have they been of advantage in the purchase of fertilizer and other supplies?—A. Yes.

Q. (By Mr. KENNEDY.) Is it a fact that there is a successful organization of dairy farmers in New Jersey to control the output and price of milk?—A. There is an organization that affects the extreme northern counties, connected with the Five States Milk Association, with headquarters in New York. I do not think it has accomplished much yet. I think the organization is hardly in working order. Last week I met a gentleman from the northern section of the State, a large farmer, who is interested in that, and he told me that they were not yet in condition to test it really and know whether it was going to be of any benefit or not. That is the basis from which I answer that question.

Q. (By Representative GARDNER.) Do you know whether there are some lines in New Jersey where there is underproduction to which more land might be devoted?—A. No; I do not know that I do. One crop might bring a high price this year and a great many farmers might go into it next year and make an excess and down would come the prices.

Q. In a general way, what has been the effect of improved agricultural machinery in New Jersey on labor, wages, and the profits of the farmer?—A. I do not know how farmers could exist and go on farming without it. It has been a great benefit. We employ as many men as we did, but we are farming more extensively and it would be impossible to go back to the old methods.

Q. It would be impossible so long as you are in competition with other areas which used it, but I presume the question contemplates the entire absence?—A. If the whole country and the world was to abandon improved machinery we might possibly then go on the same basis we are now.

Q. Have you studied theories as to the ways in which markets for the American agricultural products might be extended?—A. I have my views about that. I do not know that I would say extended out of our own country, but I think the American farmer is, after all, dependent on a good home market, and if the supply of agricultural products in this country and the demand can be brought to any ways near an even balance, I think that farming would be as good as any other business, as good as anybody could expect. When we get outside of our own country we have to go into competition with cheap labor of other countries.

Q. Then the increase of city population increases the farmer's market?—A. Yes;

very materially. When our potteries in Trenton were in full blast it was no trouble for the farmer to take a load of produce and get the ready money for it.

Q. And even the farmer boy who leaves and goes to the city becomes a consumer of farm products and to that extent aids the farmer, does he not?—A. Yes.

Q. Taking into account our improved machinery and the conveniences, commercial fertilizers and all that, what, in your judgment, is the comparative cost of production of a crop now under the new conditions, and under the old, before you had either?—A. I think the comparative cost is about the same as it was in 1860.

Q. Assuming that there is a gain in the machinery and fertilizer, where does the loss occur that balances that?—A. Our farm labor costs us a great deal more than it did in 1860; and in 1860 commercial fertilizers were just beginning to be used, were not used one-quarter as extensively as they are now. We were compelled to use it because our soils were becoming exhausted. Now we have to supply that deficiency.

Q. Are wages higher?—A. Yes.

Q. By the month?—A. By the month and by the day.

Q. And the hours; how much shorter?—A. The tendency is to shorten. Many diversified interests come in. A trucker has to make large hours at certain seasons. The dairyman who retails milk or ships to Philadelphia—the train goes early in the morning—has to get around very early in the morning. These two classes of men have to make very long hours, especially in the summer, and they do not get off from their time what they used to; but with other classes of farmers who do not ship milk, but follow the old lines of raising cereals, the tendency is to shorten hours.

Q. Is it not about universally true that the farm hand of to-day is determined to work more deliberately and comfortably than he did 20 years ago?—A. They are much more independent in their work than they were back 20 and 30 years ago.

Q. What, in your opinion, is the effect of the good road movement in New Jersey on the agricultural interests?—A. I can not see that good roads will be of any great benefit except to the farmers that are adjacent to the large cities. To them they are undoubtedly a benefit.

Q. What do you call adjacent? What is the hauling distance to market in your neighborhood?—A. Well, take a dairyman that runs his milk into the city, and who has to make a trip every day; and take the man who raises grain, for instance, hay, which is one of our great staples; the man who carts his crop of hay to Trenton—the average farmer sells, say, 30 loads of hay—has to make 30 trips over that road to Trenton, and the milkman has his 365.

Q. I notice through Burlington County, people above Riverton, over about Mount Holly, drive to Philadelphia with their truck, some of them as much as 18 miles certainly.—A. We have very few that haul that far to Trenton markets. The radius for that market is about 6 miles. With hay, grain, and potatoes they will run in for perhaps 12 miles. On the good-roads question, it is a help to the farmers living along these roads who come to the market frequently. For farmers living off from them a little distance, who do not go to Trenton frequently, it does not materially increase the value of the farm.

Q. What is the variation in transportation charges from your vicinity to either Philadelphia or New York within any period fresh in your memory?—A. There has been a very little change. The rates on some things to New York were increased a few years ago, especially on live stock.

Q. From all the indications now apparent, what is your opinion as to the future of agriculture in New Jersey?—A. I think the outlook is favorable. One thing that has made it a great burden, many bought their farms 20 or 30 years ago when the price of land was up, paid about one-third down and gave a mortgage for the balance, or one-half down and a mortgage for the balance, and the money they put in that was swept away. Lands are down now. If a man buys a farm now he is in a very different condition from the man who bought a farm 30 years ago. My own opinion is that in our own country our supply and demand will equalize itself, perhaps in the present generation, we might say, and when that comes to be the case I think the outlook is good. Our best western lands are taken up, and our population is increasing so that, after all, when we compare figures the amount of our exports is not so very much compared with the whole amount that we grow. If we can get that near equalized (I think it will come before many years), the outlook is very good for the farmer. I would not advise a young man to buy a farm without any money, but if he can pay one-third or one-half down and is willing to work, I do not know of any occupation that the average young man would have a more certain way of making a living from than he would by buying a farm.

Q. (By Mr. KENNEDY.) That advice, I suppose, applies to the young man who has been reared on the farm?—A. Yes.

Q. Do you find in Trenton a sufficient market?—A. For some distance around Trenton; all the goods from that section of the country, and most of the hay and milk.

Q. Do you not think the New Jersey farmer should have some one to do his buying and selling?—A. One of his own class as a commission man instead of the regular commission man? How long would it be until he would be as bad as the original or professional commission man?

Q. It would depend a good deal on just what he could make out of it. You could arrange among yourselves for a reasonable commission. Do you not think there is a great deal of money lost by not having a man on the market knowing what the products are worth?—A. The method among the commission men in New York to a great extent is that they buy the goods that are sent there themselves and make returns for what the market price is that day. Very largely the commission men at the present time in New York, on articles that can be held, are the purchasers, the jobbers.

Q. In your farmers' meetings there have you taken up that question?—A. No. In our section we have scarcely anything to send to the New York market because we are fortunate in being near a market that is oftentimes better than the New York market. Let our potteries be in full blast in Trenton and we have no use for the New York market.

Q. Would the same amount of money put into farming yield as much as if put into mechanical or manufacturing business?—A. It might not yield as much and it might yield more. If a young man adapted for farming should buy a farm, would study it, and give his close attention to it, he perhaps would succeed more than if he put his money into mechanical pursuits. On the other hand, a young man not adapted for farming might succeed best the other way.

Q. To a young man raised on a farm, an ordinary farmer's boy, are there more inducements to stay at farming than start in any other kind of business?—A. For myself, I think the inducements at the present time are as good for him to remain on the farm as to go into the city.

Q. Take it the 12 months round, do you think the farmer does any harder work than the mechanic working 8 to 10 hours a day in the city?—A. A great many of our farmers do, especially truckers and the dairymen. I do not think the average labor on the farm the year through is any harder than that of the mechanic who works 10 hours; but put it down to 8 and it makes a good deal of difference.

Q. (By Senator MALLORY.) Hour for hour, do you think they work equally hard?—A. It is owing, of course, to what kind of mechanical labor a man is engaged in.

Q. Machinist or molder?—A. I think the machinist's labor would perhaps be as hard or harder than the farmer's, the year round.

Q. Do you think farming is more exacting than mechanical life, or is it easier?—A. I might answer that question by saying, anything is exacting if followed out thoroughly, farming as well as mechanical arts.

Q. But you say the farm hand is getting more independent, more conservative of expending his energy?—A. The tendency of our best farm labor, such as we had 30 or 40 years ago, has been to leave the farm, especially our American laborers, and go to the city. One reason for that was that they could get higher wages than the farmer could pay. Another reason, especially in different manufacturing, such as the large wire works, which manufacture millions of yards of wire cloth and things of that kind, his family and daughters could go to work. In the potteries they employ hundreds of girls. They could get work and get fair wages, and the family could spend their evenings at home together and have these social advantages and earn more money than they could on the farm. These things have drawn our best American labor away from a radius of 30 or 40 miles of the city.

Q. You have plenty of help the whole year round?—A. Yes.

Q. Do you take into account the fact that most of these mechanics do not get over 8 or 9 months' work, at presumably higher wages than the farm hands would?—A. Mechanics' wages are higher because very few work by the month, but work by the day of so many hours.

Q. To spread the mechanic's greater wages over the 12 months, is not the farm hand in about as good condition as the mechanic?—A. I think he is.

Q. With all of this, cheap, fresh vegetables, lay by, leisure, and everything else, is he not in better condition than the one who seeks the mechanical trade?—A. I think that is true. But after they get in the city with their families it is a gay life for the young people, and you can not get them to return to the farm. They will starve almost, but they will not go back.

Q. The allurements of the city are really the reason the young man leaves the farm, not because his task is harder and not as well paid?—A. Not always the allurements. There are ambitious young men who want to make money faster than they can make it on the farm; young men who wish to enter professions are the pushing young men.

WASHINGTON, D. C., June 24, 1899.

TESTIMONY OF MR. A. C. TRUE,

Director of the Office of Experiment Stations, United States Department of Agriculture.

The commission met at 11 a. m., Second Vice-Chairman Gardner presiding. Mr. A. C. True was sworn as a witness, and testified concerning agricultural experiment stations and colleges, as follows:

Q. (By Representative GARDNER.) Please state your name?—A. A. C. True.

Q. Occupation?—A. I am director of the office of experiment stations, United States Department of Agriculture.

I might say that under the call which I received to come before the commission I have prepared myself to speak especially on topics which are included under Nos. 23 and 24 of the commission's topical plan of inquiry on agriculture, technical education in agriculture, and the agricultural experiment stations, and I shall have something to say on the adaptation of the public school to the needs of the agricultural people. I take it for granted that as I proceed in my remarks members of the commission will put in questions wherever they desire special information, and if I am able I will give it.

Just a word as to my competency as a witness on these subjects: The office of experiment stations, with which I have been connected in various capacities since its foundation, is a sort of clearing house for agricultural education and experimentation in this country and abroad. We receive there the reports and bulletins of all the agricultural colleges and experiment stations and from many foreign countries, and we make a business of reviewing all that literature for the purpose of knowing its contents and publishing as much as may be of general advantage to our people in this country. Besides that, we have made, within recent years, personal visits to every part of the United States except our new island possessions, and also to many of the countries of Europe. I have been myself a number of times to all of the States and Territories in the United States except Alaska, and I have also visited Europe for the purpose of studying questions relating to agricultural education and experimentation. So that, in a general way, I think I am in a position to look at this matter broadly, and I hope I shall be able to bring out some information which will be of use to the commission.

First, let me call your attention to the fact that there has been within the last half century a great world-wide movement for the organization of technical education in agriculture and scientific research along agricultural lines. It is very important, I think, that our people should understand that the work we are doing in this country is simply a part of what is being done the world over, and that the great commercial nations, with which we are more and more coming in competition, are every year increasing their efforts to perfect their system of agricultural education and investigation.

The movement abroad, in some respects, has reached its highest perfection in France, Germany, and Belgium, where agricultural education has been quite thoroughly organized, and includes schools of different grades from the university down to the elementary school. And now such countries as Russia and Australia and Japan are developing quite complete systems of agricultural investigation and education, and even in countries that we have counted as among those that never move in progressive lines there is a movement in this direction. In Egypt there is at least one very well organized agricultural college, and in connection with it agricultural experiments are being carried on under competent direction. Recently the Sultan of Turkey has called on the Secretary of Agriculture to recommend some scientifically trained expert along agricultural lines who might advise him how to organize agricultural education and experimentation in the Turkish Empire.

In this line, as in other lines, we must always remember that we are meeting an ever-increasing tide of competition and that we can not afford to be behind

the rest of the world in any way in the organization and perfecting of our schemes for technical education in agriculture and for scientific and practical experimenting in agricultural lines.

Coming now to the United States, we may say in general that we have three agencies for agricultural education and research. We have the agricultural colleges and schools, the agricultural experiment stations, and the United States Department of Agriculture. The United States Department of Agriculture is, in the main, a great agricultural experiment station, working along both the higher lines of scientific research and more practical lines, and giving out a large amount of information for the benefit of the people. I thought that very likely the commission would call before it some representative of that Department who would speak particularly of its work, so it is my purpose not to say anything about it in detail to-day, but to confine myself to the system of agricultural education in this country and the agricultural experiment stations.

Briefly speaking, our system of agricultural education includes agricultural colleges, agricultural schools which are of a lower grade, the farmers' institutes, various plans of university extension, as it is now called, such as home reading circles and farmers' clubs, which pursue courses of study under the more or less direct supervision of the agricultural colleges; and besides that we have a movement, now rapidly gathering head, for the introduction of nature study into the rural schools, somewhat after the same plan as has been introduced into the city schools, but with a choice of subjects more directly relating to agriculture.

Speaking first of the agricultural colleges, they are organized under what is known as the land grant act of 1862. This is an act which is very broad in its scope, and for that reason the system of institutions which have grown up under it includes a wide range of colleges and universities, and much misapprehension has arisen in the public mind regarding these institutions because they are loosely classed together in the public press and otherwise, oftentimes, as agricultural colleges. Now, the fact is that in this country we have only one purely agricultural college, and that is located in the State of Massachusetts, at Amherst. In 27 States and Territories the colleges are organized as agricultural and mechanical colleges, not always having exactly that name, but they are colleges in which, along with agriculture, there are courses of instruction relating to the mechanical arts and other subjects like domestic science, and in many cases some shorter courses, so that in these 27 States you have institutions ranging all the way from those which have 2 or 3 courses of study to those which have 12 or 15 different courses of study.

Q. (By Representative LIVINGSTON.) How do you class the Mississippi College?—A. The Mississippi College is classed as agricultural and mechanical—that is, it has courses in agriculture and mechanic arts especially.

Then, in 20 States, these land-grant colleges are the State universities, in which there is a department or school of agriculture, but of course these State universities take in every subject that comes within the scope of education, as far as their means will permit. In all these institutions we have different kinds of courses for agriculture—the regular 4 years' college course, a shorter course, commonly of 2 years' duration, special courses, as in dairying, etc.—and there has been a great tendency, as far as the agricultural side of these institutions is concerned, within the past few years toward specialization, both in the dividing up of the subject of agriculture into different branches which are taught by different teachers, and in the offering of more special courses in different agricultural subjects; and this, I think, is strengthening the agricultural course and bringing it into line with the courses given in other subjects, and enabling it more fully to meet the needs of different classes of students.

You may be interested in one or two of these special lines of work. For instance, there is at the University of Wisconsin a special dairy school, which has already sent out about 800 trained butter and cheese makers, and has also taught between 1,000 and 2,000 young men butter making on the farm as distinguished from that in the creamery. There is also at that institution a short course in agriculture which this year had 190 students in attendance. In this case they are working directly for the interests of the farm, as you will see by this statement which the dean of the college, Professor Henry, makes:

"We have found places on the farms this year for more than 60 young men, and 20 more will probably find employment within the next week. These young men secure from \$3 to \$5 or \$10 more per month because of their training with us."

Another instance of this special school work is in Louisiana, where a school for training sugar experts has been in operation for a number of years at Audubon Park, New Orleans, in connection with the experiment station, and more recently at Baton Rouge, in connection with the State University, that has proved useful

and is meeting with outside approval and with the support and financial assistance of the Sugar Planters' Association.

We have in this country, at present, land-grant colleges in all the States and Territories except Alaska; and in some of the States, especially in the South, there are separate institutions for the colored people, so that the total number of such institutions, according to the statistics for 1898, collected by the office of experiment stations, was 64, of which 61 maintained courses in agriculture. They had, in all, resources of funds, lands still unsold, farms, buildings, apparatus, machinery, libraries, and miscellaneous equipment to a total value of something over \$53,500,000, and the income of these institutions, derived from the land-grant act of 1862, from the United States appropriation under the act of 1890, from State appropriations, from fees, and from other sources made a total of a little over \$6,000,000. The value of the additions which were made to the buildings and the equipment of these institutions in the single year 1898 is estimated to be \$2,800,000, showing a large relative increase and indicating the strength which these institutions have in the public regard, because a large part of this money came from the State appropriations.

The number of persons teaching in these institutions was, in 1898, 2,611, and in the colleges of agriculture and mechanical arts 1,722 instructors were employed. The total number of students in these institutions in that year was reported to be 31,658, and, in the courses of agriculture alone, 4,181.

Now, it would not do to measure the influence of these institutions on agricultural education and the promotion of the intelligence of our farmers, by the instruction they give in exact facts regarding this art; it will not do to judge the influence of these colleges in that direction by the number of students in agriculture, because these institutions, as I shall try to show you a little later, are in many ways going out beyond the class room to exert a much wider influence on agricultural progress in this country. But I think it is something that we ought to note carefully as an encouraging feature that we have such a large number relatively of students who are actually pursuing college courses in agriculture, for we are thereby, it seems to me, doing a great work in training the men who are to be the leaders in agricultural progress. We are sending out every year a body of thoroughly trained young men along agricultural lines whose influence, without any doubt, will be very great in promoting the progress of agriculture in this country.

We will consider next the schools of agriculture of lower grade than the colleges, and here we shall find that we have simply the beginning of a movement. There is connected with the University of Minnesota a school of agriculture of high-school grade, having a course of study and a faculty organized separately from the college of agriculture in the university, and giving instruction of a distinctively lower grade. This school, last year, reported an attendance of 275 young men and 60 young women. It is also affirmed by the managers of this school that nearly all of its graduates returned to farm homes, and as one branch of that institution there is a dairy school, which has in attendance about 100 young men who have had some previous experience in butter and cheese manufacture, and who have come to get a more technical knowledge of this subject.

A similar school has recently been started in the University of Nebraska and this year has an attendance of 60 boys, reported to be directly from the farm and with the intention of going back to the farm. The schools for colored people, the Hampton Institute, in Virginia, and the Tuskegee Institute, in Alabama, under Booker T. Washington's wise management, of which we have all heard so much, are developing agricultural courses along these high school lines. Then we have a school under the Jewish auspices at Doylestown, Pa., endowed, as I understand it, by the Baron Hirsch fund to a considerable extent, which has a farm school on the European pattern, I should judge, though I have not had the privilege of visiting it. They take the boys to live on the farm and instruct them in agriculture along practical lines. I also understand that the Miller Manual Training School, in Virginia, gives some training in agriculture along this line. This, as I have stated, is only a beginning. In my judgment, every year shows more conclusively that we need in this country to develop secondary schools for agriculture as they have been developed to a considerable extent in the leading countries of Europe. Now, there are two ways in which I think this may well be done. I think we ought to have a number of special schools after the plan of those schools in Minnesota and Nebraska. They might be begun in connection with the land-grant colleges, but they ought to be extended so as to have a number of them at different points in different parts of the State. They can be run, of course, as secondary colleges at comparatively moderate cost and the expenses of the students can be made smaller than in the colleges, and they would be nearer to the students' homes; but even if that should be done,

I think that in addition we should have the introduction of what I would call outline courses in the theory and practice of agriculture in the high schools in or near the rural communities. I do not think that our people outside of the cities fully understand that the cities are constantly developing their high schools along the lines of manual training and technical education. In Washington, for example, we have a business high school as a separate institution, and we are going to have a manual-training high school. In many high schools in the smaller cities, we have courses which directly relate to the various lines of business and industrial arts. Now, I think the same thing ought to be done for agriculture, and, in my judgment, it is a comparatively simple matter at least to make a beginning of this work. Many high schools in the cities where the high-school system is well organized already have at least one teacher who is chosen because of his ability to teach natural science in certain branches. That teacher might just as well be a person who had received instruction in scientific agriculture in the land-grant college, if you will, because there, of course, he gets instruction in the natural sciences, which is just the same as he gets in any college, and he receives instruction in technical agriculture besides. He could offer an outline course in agriculture as an optional study, if you will, that would enable the boy going from the common school to the high school, as many of them do to finish their education, to take up at the same time, in his high-school course, such a general survey of modern scientific information relating to agriculture as would enable him when he went back to the farm to further the movement that is going on for the uplifting of agriculture along these lines. It would enable him to understand more fully the bulletins sent out from the experiment stations and the Department of Agriculture, and, in a general way, it would give him an outlook toward comprehensive agriculture which would be of the greatest value to him. He could get all that without going farther from home than he now does to the high schools located in his own township or near there.

Now, a similar thing to that along another line has been done in some States for the advantage of the high-school teachers; for example, the State of New York gives to every high school that organizes a teachers' class with a certain number of students a subsidy, varying, according to the number of students, say from \$500 to \$1,000 a year. That enables that high school to get a teacher who has had some instruction in a normal school, and he, in connection with his other duties, organizes a teachers' class and gives them an outline course in teaching. That is doing a great deal in New York State to raise the grade of teachers in the public schools, and has been found a comparatively inexpensive plan. I think the same plan might be applied to the teaching of agriculture in the high schools under the auspices of the State.

Passing now, and considering briefly the farmers' institutes, which we may call the adult farmers' school of agriculture: these are organized in different ways in the different States. In some cases they are under the general management of the agricultural college or experiment station. More frequently they are under the direction of the State board or commissioners of agriculture, and in a few States there is a special State officer known as the superintendent of farmers' institutes, who has that general management. There has been a very rapid increase in the number of institutes annually held in this country. There are, I am sorry to say, no exact statistics available regarding these institutes, but I have collated them as well as I could, and I have estimated that institutes are regularly held now in about 30 States, and that during the past year some 2,000 institutes were held, the total attendance at which was about 500,000. These institutes are passing through an interesting stage in their development. When they were first organized the farmers seemed to like best to hear the local men who had had experience in their immediate vicinity—some successful farmers—and they did not care as much about outsiders; but nowadays the demand more and more is for expert talkers at these farmers' institutes, men who can not merely state what is within their own experience, but who have had opportunity for some wide study of agricultural problems, and so in one or two places at least there is the beginning of a movement to organize a special corps of institute workers. They have, thus far, largely drawn upon the colleges and experiment stations; but these men, I must say in their behalf, are getting overworked, and so now there is a call for men who will devote their time more largely to the special work of the institutes. I think myself that this is a thing which ought to be encouraged; that we ought to have in this country men corresponding to what they call in France traveling professors; men who can be connected with the central office of the farmers' institute in the State, and who can have time to go to agricultural colleges and experiment stations, or come to Washington and see what is going on in the Department of Agriculture as well as look around and see what the needs of the farmers are in

their own State. Then it should be made possible for them to disseminate this information by oral communications at the farmers' institutes and other farmers' meetings.

Some of the States in which the institute movement has been most successful are the following—a few instances to show how the movement is developing:

In Wisconsin there are now annually held 120 institutes with an average attendance of over 50,000 persons, and 60,000 copies of their annual institute bulletin, in which the best addresses are grouped together, making a book of over 800 pages, are annually distributed, and a copy put in every school library in the State. For this work the State gives an appropriation of \$12,000 annually.

In Massachusetts 125 institutes are held, with an attendance of about 18,000 farmers.

In Minnesota 50 farmers' institutes of 2 or 3 days each are held, with an attendance of from 300 to 1,000 people at each institute, and 15,000 copies of their annual report are distributed.

In Indiana an attendance is reported of over 25,000, an average number of 273 persons in somewhat less than 100 institutes.

In Michigan institutes are held in nearly every county and the total attendance is reported to reach about 120,000.

In Pennsylvania some 200 institutes are held.

In Ohio 235 institutes in 88 counties were held, with an attendance of about 90,000.

In New York some 250 institutes are held in a single year.

Pass on, now, to consider briefly what may be called university extension work on behalf of the farmer, a part of which is included in what the colleges do for the farmers' institutes, as already shown.

We have an attempt in Pennsylvania and some other States to organize a regular course of home reading for farmers. The Pennsylvania State College was the first to do this in any thorough way, and its work may show what can be done in this line. They have at present enrolled at the Pennsylvania State College between 400 and 500 persons who are pursuing these courses at their own homes. A syllabus of the course is sent out to each of these persons and they are recommended to read certain books and asked to write answers to questions, and these answers as they come in, in many instances, show a surprising degree of proficiency. That work is growing rapidly, and it has already taxed the resources of the college to carry it on. Besides this, we have at times had what may be called traveling schools—that is, instead of the ordinary institutes, we have the instructors in the colleges and workers in the experiment stations going out and taking up some particular line of instruction for, say, 3 days, in a special locality, so that those in attendance get a little more systematic survey of the subject than at the ordinary institute through addresses. This is just in its beginning in this country, but has been attempted abroad to a considerable extent. For example, in England a number of traveling schools for dairying are put in operation each season. A dairy outfit of the modern kind is taken along on the train and on the cart finally, and the teacher in charge not only makes an address, but he shows how these instruments or apparatus are to be worked, and helps the farmer in this way to get an idea of the more modern methods.

Lastly, under the head of agricultural education, we will consider agriculture in the elementary schools. This has been undertaken in some European countries to quite an extent, but the outcome is as yet problematical. The one great difficulty thus far, as in this country, has been to find teachers who are properly trained for that kind of work, because it requires a special training and especial adaptability to succeed; and then the general demand for the introduction of new studies into the elementary schools growing out of the general broadening of human knowledge makes it a very difficult matter to determine how far any special subject like agriculture can be safely and wisely introduced into the common schools. In some cases it is done with considerable success abroad. I remember, for instance, going myself to a school in a little village in Belgium, where the teacher, as in Europe in such schools is almost universal, was a man, who was that day giving instruction on milk to children 12 and 14 years of age. He was doing it in good shape, and they were much interested, and trying to get out of it all they could. They told me he was a very unusual man. His whole soul was in his work. He was secretary of an agricultural club of the village, and he was trying to introduce a modern dairy, besides his onerous duties as general schoolmaster. He was one out of a thousand. That shows that under some circumstances, at least, something can be done in this line, but, generally speaking, I do not myself believe that the formal teaching of agriculture can be introduced into the common schools, and that seems to me to be certainly true

under the present condition of our common schools. What we need to do now is to reform our country schools along the modern lines of elementary instruction, just as we have the city schools, and we shall be busy for some years to come in getting the common schools into as good condition along these lines as they ought to be. One thing which can be done, and which will have considerable bearing on agriculture, is to introduce into the common schools the teaching of nature, to use a phrase that is becoming common—that is, to have the teachers in these schools as a part of their regular work lead the scholars to observe the natural objects and phenomena about them, and thus to get a start along the line of modern thought relating to science, and to see in an elementary way how this is related to their practical affairs. If that can be done in the rural schools generally, of course the subjects which would naturally be selected by the intelligent teacher would very largely be subjects related to agriculture. If the teacher was to teach about a bug, for instance, the natural thing in the country would be to take a bug which was prominently known to the people there as a bug helpful or injurious to agriculture, as the case might be; and any intelligent teacher in the course of instruction would point out the fact that it was beneficial or injurious to agriculture; and so in regard to a wide range of subjects relating to nature. This movement has begun in a very successful way in the State of New York. It has spread into Indiana and Maryland, and possibly into some other States. It seems to me to be the coming movement for the improvement of rural schools in the direction of benefit to agriculture. In New York the State makes an appropriation of \$35,000 for university extension work to the college of agriculture connected with Cornell University, which is the land-grant college. A portion of that money is to be spent in simple experiments to be carried on in different parts of the State, and under such appropriations the college of agriculture and the experiment station connected with Cornell University have carried on several hundreds of experiments with potatoes and fertilizers and such other things as the farmers themselves could manage; and these have been distributed quite broadly through the State. But a good deal of the money is used in the preparation and dissemination of leaflets on nature subjects, which may be used by the teachers in preparing simple lessons for the scholars in the elementary schools, and then the instructors in the agricultural college go about the State to attend the teachers' institutes and farmers' meetings to explain this movement and to help on in the work.

They report that this year, under this plan, instruction is being given to some 10,000 farmers and about 25,000 teachers, and presumably, of course, to the scholars under the control of these teachers. Now, the only difficulty about this movement is that it is so popular that the work imposed is an embarrassment to those in charge of it, and, as would be natural, the city schools see in it an opportunity to improve their course of study, and so the demand for these leaflets has come to a considerable extent from the teachers in the city schools, showing that they are alive to the subject. I speak of this because one of the greatest difficulties in such movements grows out of the conservatism of the farming population. I had myself an experience covering a period of years as a teacher in one of the State normal schools of Massachusetts. We trained our teachers, among other things, to give lessons on nature subjects. In Massachusetts the schools are under the control of the local board, and we found that when the teachers went out into the rural schools and undertook to introduce these nature studies the school board said: "Oh, no; we do not want these new-fangled studies. Readin', writin', and 'rithmetic is good enough for us." This is a matter that you will have to contend with in extending this movement for the introduction of nature study into the common schools. You will have to overcome the conservatism of the mass of the people in rural regions.

I have gotten through now with what I had marked out to say about agricultural education. If there are any inquiries, I might pause briefly there.

Q. (By Senator MALLORY.) Do I understand you to advocate the introduction of these practical lessons in agriculture in the common schools in urban as well as rural districts?—A. No; I do not think we can urge that agriculture ought to be taught specifically in the urban schools, and yet it is very difficult to make, of course, an exact division. I think agriculture might well be taught in a great many places that we might call cities, which are intimately associated with rural communities, but in our large cities, like Philadelphia and New York, I doubt if they would find it expedient to introduce the teaching of agriculture.

Q. Where would you draw the line between urban and rural schools?—A. I do not think any exact line could be drawn.

Q. That would have to be left to each particular case?—A. Yes; to each particular case.

Q. There would be danger, I suppose, of rather overloading the curriculum with practical work in having it in the city schools, because there is always, if I am not mistaken, a movement to bring in practical mechanics, industrial arts in some of the schools.—A. They teach things relating to the industries of the cities. What I urge is, in the high schools in and near the rural communities, there should be teaching relating to agriculture.

Q. How are you going to draw the line?—A. I think that would have to be determined largely by the local conditions. There are cities of 50,000 to 60,000 inhabitants which really are rural centers surrounded by agricultural population. Take, for instance, a city like Des Moines, Iowa, where the agricultural interests of the State are so prominent. I have no doubt in the high school in Des Moines there are quite a large number of students who have come from the rural schools to finish their education. It would then be very appropriate, in such a school as that, that an optional course should be formed in agriculture for the benefit of these students. They could do it without any considerable expense, because, as I said, they already have at least one teacher who is equipped along scientific lines, and if they got a teacher from some agricultural college he would know just as much science, and he would be able to give instruction in agriculture besides.

Q. (By Mr. FARQUHAR.) Will you please state the substance of the law of 1862, the land-grant act?—A. It is a law which granted each State and Territory 30,000 acres of land for each Representative or Senator in Congress, the proceeds from the sale of which were to constitute a fund to be held by the State and devoted to the maintenance of colleges in which agriculture and the mechanic arts would be taught, but in which other subjects, not even excluding the classics, might be taught.

Q. Do you recollect which State first took advantage of the act?—A. I do not. Colleges have been organized in all the States and Territories which could take advantage of the act.

Q. Before the act of 1862 how many States had what we call State agricultural colleges?—A. Only a very few. The college of Michigan was the first college; established, I think, in 1835; Maryland had made some movement in that direction; Pennsylvania likewise, and so in possibly 10 or 12 States there had been a movement.

Q. In the early part of your discourse you mentioned that France, Germany, and Belgium had made great advances in agricultural education; why do you except Great Britain?—A. Great Britain has been backward in that respect. She has no thoroughly organized agricultural education or experimentation. There are a few agricultural colleges; and she has in recent years given grants of money to a number of institutions, but there is no regular system. She is behind, but she is beginning to wake up to see, as in regard to technical education generally, that this is one of the problems in England nowadays.

Q. I suppose in Great Britain—if they have not organized systems of agricultural education, how do you account for the fact that the farmers are able to pay £3 to £5 rental annually and get crops off that pay them? This is a practical view, independent of the educational features, is it not?—A. I should say, in large measure, that is due to the market right at hand—at their doors. England has imported a very large portion of her agricultural material of all sorts, but along lines which call for intensive farming, market gardening, and, to a certain extent, the raising of fine stock and industries which require a large amount of practical skill, patience, and systematic effort, her farmers have the advantage, though it is not certain how long they will retain that advantage. I should judge from what I read they do not feel secure in that position.

Q. The point is this, you say that Great Britain has not systematized its education in agriculture, and yet practically this result we know, that farmers raising cereals in Great Britain pay rent from \$15 to \$25 per acre annually and make it pay. How does the British farmer learn these scientific principles?—A. He has learned through long years of the necessity for careful culture, and then he has taken advantage to a considerable extent. I would judge, of the information which has been given him through what has been done on the continent of Europe. You will find that the reports of the experiment stations in France, Germany, and Belgium are being constantly translated and made available to the English farmer. Much valuable information has also been given him by the experiment station at Rothamsted, in his own country, which has been at work over 60 years. But, on the other hand, in some things he has not been able to hold his own altogether. The farmer in Denmark, who took up with the scientific side of dairying and with the help of his Government organized the business of dairying on a scientific basis, has been able to go into the English market with his butter and

drive out, to a certain extent, the Englishman himself. The Danish butter, I understand, is rated higher than any other butter on the English market.

Q. And so with respect to Canadian cheese. I do not think the Canadians are very far advanced in agricultural education, but Canadian cheese can sell in Liverpool and London markets against the best Dunlop.—A. But in Canada there has been of recent years very systematic and thorough work in agricultural education and investigation. They have an admirable system.

Q. I thought in Canada, on account of the sparseness of population, it would be difficult to bring education in among the Canadian farmers?—A. I do not mean that large numbers of Canadian farmers have actually gone to colleges, but they have good agriculturists and good experiment stations, the reports of which have been widely disseminated in Canada.

Q. To go back to the British farmer question; do you not think that the three great societies of agriculture in England and Scotland, through lectures and positive experiments on their farms, without colleges, have really brought British agriculture up to its present high state, so that these farmers, renters, can pay these high rates of rent?—A. I think these organizations have had an important part in it.

Q. Do you not think in these schools you are speaking of now, that there has been a good deal of lecturing and use of the class book and the study of formulas and all that, and not enough real practical work on the farm carried on by the students in the agricultural colleges?—A. Perhaps, in a general way, I should agree with you, but not probably in just the sense you think; that is, without doubt, the general plan of teaching in the agricultural colleges and schools of this country has been not well organized. One thing, I may say in that connection, that the Association of Agricultural Colleges and Experiment Stations is doing now is to study the methods of teaching agriculture with a view to their improvement; but when I say that, I do not think we will have to go back to the old system of manual training in the schools, which has prevailed in Europe in connection with agriculture, as with other subjects. I do not think that it is the best plan to have the boys go to a school and spend a considerable portion of their time in working on the farm. The farm connected with the school, in my judgment, should rather be used just as a laboratory is used in connection with the teaching of science, to show certain things and to show how certain principles are to be applied to practice. Now, that will not be always done by the ordinary methods which the farmer would use on the farm, but the student, if intelligently instructed along these lines, can go back to the farm and apply these. Of course, he will incidentally get a certain amount of practice if the teacher is wise, which will enable him to carry out these things practically.

Q. Is there not really among the agriculturists of the country a considerable aversion to what they call "book learning" instead of practical lessons in agriculture, and is not that the greatest obstacle you have to overcome?—A. Yes; it is a very great obstacle. At the same time you may say, on the other hand, there are more farmers every year who read and profit by the literature which is available to them. Of course, nobody wants to claim too much for reading or acquiring information in schools, but I think we may fairly claim that as accurate information is obtained the farmer has more and more taken advantage of it.

Q. In various States of this Union, more especially in the States that were cultivated by black labor, we have the problem of a naturally impoverished soil. Even with the fertilizers and the known accessories that belong to agriculture it is hard to raise a profitable crop. Do you think that any of these lands can be reclaimed or profitable crops raised without the use of scientific agricultural means?—A. No. I do not think so, using the word "scientific" in its broad sense.

Q. I mean the everyday practical knowledge; that he has to acquire a knowledge of his soil and to diversify crops. Do you not think that is the largest problem we have to meet to day?—A. It is a very large problem, especially in the South and east of the Alleghenies.

Q. Now, do these experiment stations in the South, at Hampton and Tuskegee, cover anything like the problem of reclaiming these lands? Do you think that the style of education there is going to be helpful or is it sentimental?—A. I think the education in agriculture is decidedly practical. Of course, it has not gone very far, but the experiment stations and agricultural colleges in the South are teaching a great deal along this line, and the farmers should listen to what they have to say. Of course, in the South the greatest difficulty grows out of the conservatism of the farmer, which increases in proportion to his ignorance. The colored man has it deep into his mind that it is no use for him to try to raise anything but cotton. That is the only crop on which he can get money advanced, and so

he is unwilling to venture beyond that with which he is already familiar; but I think things are reaching such a stage in the South that he will be compelled to venture, and when he has once ventured he will find that he can live for an indefinite length of time if he does not get his advances; and if he is not at the mercy of the men who make advances of money on crops I think he will be a great deal better off year by year if he does not grow so much cotton. There are thousands of farms in the South where the profit on the better part of the land is more than eaten up by the loss on the poorer land, where cotton is grown under the present methods.

It was my purpose, if there are no further questions, to take up now the agricultural experiment stations, about which I have not said anything material thus far. Experimenting along agricultural lines began in this country in a regular way with the establishment of agricultural colleges, but it was only organized definitely as an experiment-station movement just about 25 years ago, when the first regularly organized experiment station was started in the State of Connecticut. About the same time a similar thing was done in California, and stations began to be formed here and there in other States, until in 1887 we had 17 experiment stations in 14 different States. In that year Congress passed what is known commonly as the Hatch act, which gave to each State and Territory annually \$15,000 a year for the maintenance of an experiment station, which, as a rule, must be in connection with a land-grant college. The only exception is in those States which had State experiment stations organized before the passage of this act. Now, these early stations were largely occupied in organizing the control of commercial fertilizers and demonstrating the necessity of the usefulness of basing the purchase of such fertilizers on the manufacturers' guaranty of their chemical composition, but the stations made also sufficient scientific investigations to indicate that with broadened facilities and resources they might render much more service to the agriculture of the country. The work of organizing new stations under the Hatch act was therefore taken up with enthusiasm, and they were soon in operation in every State and Territory. The basis for this rapid development of experiment-station work had been laid by the agricultural colleges previously established under the land grant act of 1862 in most of the States and Territories. As the Hatch act made the stations departments of these colleges, it was comparatively easy to find in their faculties men competent to undertake agricultural investigations, while their buildings, scientific apparatus, and farms furnished a sufficient equipment to make it possible to begin experimental inquiries as soon as the funds for their maintenance were provided. The lines of work had already been marked out to a considerable extent by kindred institutions in Europe, by our older stations and by the United States Department of Agriculture, which already contained within itself a great experiment station through the work of its different scientific divisions. The method of publishing accounts of agricultural investigations through widely distributed reports and bulletins containing the scientific and technical details of the work or concise summaries of its practical results had already been established. It was possible, therefore, for the stations organized under the Hatch act almost immediately to undertake useful investigations and to begin the publication of information based on systematic observations and experiments.

During the past 10 years more than \$10,000,000 has been expended in the maintenance of the experiment stations in the United States. Of this sum about \$7,000,000 came from the Federal Government and \$3,000,000 from State sources. This seems, perhaps, a very large sum to expend for agricultural investigations, but it will not appear unduly so if we bear in mind that during the same period the United States produced agricultural products valued at \$30,000,000,000; in other words, we have spent \$1 in the effort to improve our agriculture and increase the output for every \$3,000 of product, which I think you will say is not a very large sum to expend in that way.

The number of publications of these stations, including 3,000 bulletins and 500 annual reports and exclusive of press bulletins, has reached 3,500. The bulletins of the stations are now regularly sent to more than 500,000 farmers, and it is estimated that about 5,000,000 copies of these publications are now annually distributed. This, I may say, is in addition to the distribution of between 6,000,000 and 7,000,000 copies of documents from the Department of Agriculture.

The experiment stations are conducting a wide range of scientific research in the laboratory and plant house and an equally large amount of practical experimenting in the field, the orchard, stable, and dairy. Practically all the stations are keeping a record of meteorological data, while 9 are making special studies of problems relating to meteorological phenomena and climatic conditions. Twenty-four stations are at work upon soil investigations, its geology, physics, and chem-

istry, or conducting soil tests with fertilizers, or in other ways. Sixteen stations are studying questions relating to drainage and seepage or to irrigation in the field or greenhouse, and with orchard, garden, or farm crops. Forty-eight stations are making analyses of commercial and home-made fertilizers or are conducting field experiments with fertilizers. At least 17 stations either exercise a fertilizer control in their respective States or make analyses on which the control is based. All stations are studying the more important crops, either with regard to their composition, nutritive value, methods of manuring and cultivation, and the best varieties adapted to individual localities, or with reference to systems of rotation. Thirty-six stations are investigating the composition of feeding stuffs and, in some instances, making digestion experiments. Thirty-seven stations are conducting feeding experiments for milk, beef, mutton, or pork, or are studying different methods of feeding. Twenty-five stations are investigating subjects relating to dairying, including the chemistry and bacteria of milk, creaming, butter making, or the construction and management of creameries. Fifty-two stations are doing chemical work and 37 are studying methods of analysis. Botanical studies occupy more or less of the attention of 37 stations, including investigations in systematic and physiological botany with special reference to the diseases of plants, testing of seeds with reference to their vitality and purity, classification of weeds, and methods for their eradication. Forty stations work to a greater or less extent in horticulture, testing varieties of vegetables and large and small fruits, and making studies in varietal improvement and synonymy. Several stations have begun operations in forestry. Thirty-four stations investigate injurious insects with reference to their restriction or destruction. Nineteen stations study animal diseases and the methods for their prevention or cure. At least 5 stations are engaged in bee culture and 7 in experiments with poultry. One or more stations have made investigations on miscellaneous subjects, such as the following: Technology of wine and of olive oil, bleaching of nuts, preservation of fruits and vegetables, gaseous fermentation of canned goods, draft tests of farm implements, road-making experiments, cane, sorghum, and maple-sugar experiments, oyster culture, etc.

That summary is, I think, enough to indicate something of the breadth on which our stations are organized. We may classify their duties roughly under 4 general heads: *a*, they take part in certain police duties such as are connected with the control of fertilizer inspection, of dairy products, etc.; *b*, they study the natural conditions and resources of the State by making something of a survey of the soil, of the plants, etc.; *c*, they conduct demonstration experiments in which they show how things, which have been worked out by science or through practical experiments can be adapted to local conditions; and then, finally, *d*, they conduct scientific investigations with reference to finding out new truths and new applications of old principles. The stations are now organized in all the States and Territories under this Hatch act of March 2, 1887, and work has been begun in Alaska under the direct supervision of the Department of Agriculture through the office of experiment stations. We have a very successful experiment station in operation in the Hawaiian Islands under private auspices, but having for its director a man formerly connected with the Department of Agriculture and the Louisiana experiment station.

Separate stations are supported in some of the States, so that the total number of stations in the United States is 54, not counting branch stations, of which there are a number. Of these, 52 receive the appropriation provided for in the act of Congress above mentioned. The total income of these stations for the fiscal year 1898 was a little over \$1,200,000, of which \$720,000 was given from the national Treasury; the remainder, nearly \$500,000, came from State sources.

Q. (By Senator MALLORY.) Is there any revenue at all from the experiment stations?—A. Yes; they get from their farms a small revenue. I have noted that the sales of farm products of the stations in 1898 in the United States amounted to \$85,356.25. Of course we can not experiment to make money, and can not expect to turn in much.

In addition to this, the Office of Experiment Stations had an appropriation of \$35,000 for its work last year, which included \$5,000 for the Alaskan investigation. The stations added to their equipment in 1898 buildings, libraries, apparatus, implements, live stock, etc., to the value of over \$176,000.

There were employed in 1898 689 persons in the work of administration and inquiry, divided as follows: 75 directors, 148 chemists, 71 agriculturists, 10 experts in animal husbandry, 77 horticulturists, 39 farm foremen, 21 dairymen, 50 botanists, 46 etymologists, 26 veterinarians, 20 meteorologists, 11 biologists, 11 physicists, 6 geologists, 19 mycologists and bacteriologists, 7 irrigation engineers, 15 in charge of substations, 23 secretaries and treasurers, 10 librarians, 46 clerks.

There are also 21 persons classified under the head of "Miscellaneous," including superintendents of gardens and buildings, apiarists, herdsmen, etc. 305 of the station officers do more or less teaching in the colleges with which the stations are connected.

During 1898 the stations published 406 annual reports and bulletins. Besides regular reports and bulletins a number of the stations issued press bulletins, which were widely reproduced in the agricultural county papers. The mailing lists of the stations now aggregate half a million names. Correspondence with farmers steadily increases and calls on station officers for public addresses at institutes and other meetings of farmers are more numerous each year. The station officers continue to contribute many articles on special topics to agricultural and scientific journals. A number of books on agricultural subjects, written by station officers, have been published during the last year.

The individual stations are brought into intimate relations with each other and are made to constitute organic parts of a great national system of agricultural research through two general agencies—the Association of American Agricultural Colleges and Experiment Stations and the Office of Experiment Stations of the United States Department of Agriculture.

The Association of Colleges and Stations holds annual meetings in different parts of the country, at which questions of general policy and management of the stations are discussed and papers on special topics connected with the work of the stations are read. The proceedings of this association are published by the Department of Agriculture. The next meeting will be held at San Francisco on the 5th of July, 1899.

The Office of Experiment Stations, organized in October, 1888, in the Department of Agriculture, examines the work and expenditures of all the stations, publishes popular and technical summaries of their investigation, collects and disseminates information regarding the work of similar institutions throughout the world, suggests lines of inquiry, aids in cooperative enterprises, and in general aims to assist the stations in developing and strengthening their work. Since its establishment this office has published 10 volumes of the Experiment Station Record, comprising over 100 numbers or 10,000 pages, over 60 bulletins, about 40 Farmers' Bulletins, and a card index of Experiment Station Literature, aggregating some 18,000 cards. Nearly 1,000,000 copies of the publications of this office alone are distributed during one year.

The American experiment station as it exists to-day is the most complete and comprehensive system of agricultural research which the world has ever known. Its publications reach farther and come home more closely to great masses of our farmers than is the case in any other country. If any farmer in the United States is not acquainted with the latest information which agricultural science has to give him regarding the means for improving his art, it is because he has neglected to avail himself of the public agencies created for his benefit.

I will speak now of some of the results of the station work under separate heads:

As to what stations have done to defend the farmer against fraud: The stations largely, especially those east of the Mississippi River, have been engaged in the investigation and inspection of commercial fertilizers under State laws. The fertilizer business involves millions of dollars and the stations have largely prevented the sale of fraudulent goods. In the State of New York alone, over 900 brands of fertilizers were examined during 1898 and even then the station did not get around with its work. In Connecticut, where the inspection has been very efficient, the business amounts to a million dollars in the year, while in Pennsylvania it is estimated it has reached \$4,000,000.

The stations have also done much to expose extravagant claims for fertilizers, showing the advantage of farm manures, cotton seed, etc., and instructing farmers how to mix their own fertilizers; and by testing the varieties of grain, vegetables, fruits, etc., the stations have warned farmers against extravagant claims for new varieties. Other matters inspected by the stations are nursery stock for fungus diseases and insect pests; seeds, adulterated food, especially dairy products, butter increasers and preservatives, concentrated feeding stuffs; quack medicines for stock, especially hog-cholera remedies; they have also exposed frauds in creamery construction and equipment and dairy apparatus.

Then they have done much to remove obstacles to agricultural industries. A very large feature of this work has been the investigation of injurious insects and diseases of plants, the value of which is now very widely acknowledged; such important work as that on the rot of grapes, apple scab, San Jose scale, gypsy moth, potato rot, potato scab, smuts in wheat and other grains; of course the Department of Agriculture has shared in this as in many of these lines of work.

It is hard to separate stations from the Department in such enterprises. By discovering an effective curd test the Wisconsin station has provided a means of detecting tainted or defective milk at cheese factories, a matter which has caused a loss of from \$100,000 to \$200,000 each summer in Wisconsin alone.

The agricultural colleges and stations have been largely instrumental in securing State laws for the inspection of fertilizers, nursery stock, dairy products, falsified foods, and feeding stuffs, creamery glassware, paris green, and for the suppression of plant diseases and injurious insects. They have also aided in the passage of laws establishing farmers' institutes, fixing a milk standard, organizing associations for the promotion of agriculture, quarantining animals for contagious diseases, sale of oleomargarine, the apportionment and measurement of water for irrigation, State aid for highway improvement, etc.

Then they have aided in the development of existing methods, crops, or industries, in their several States. I can only give you a few examples of the work done in this line.

In Louisiana, by developing new methods in the sugarhouse, previous losses in sugar making were either reduced or entirely removed, and by improving the cultivation of sugar cane and the selection of new varieties the industry has been considerably helped; and the Sugar Planters' Association has recognized that by contributing to the support of the stations to a considerable extent.

In Connecticut the chemical studies and elaborate field experiments of the Connecticut State station, in cooperation with tobacco growers, have given very important results. The quality of the Connecticut wrapper-leaf tobacco has been decidedly improved and hence this tobacco commands higher prices than any Northern-grown wrapper leaf.

In New York the animal industry and dairying have been improved by investigations made by the New York State station on ensilage, waste products of manufactures for feeding stuffs, processes of cheese manufacture, and elaborate tests of dairy breeds.

In Missouri the investigations on the draft of wagons with broad tires have shown their advantage in nearly all conditions. This seems to be a thing which the League of American Wheelmen have thought a good deal of. They published a large edition of the station bulletin on the subject at their own expense.

In New York also the station connected with the Cornell University has made a very careful investigation on the care and preservation of farm manure and the effects of careful tillage.

The Connecticut Storrs station has been notable for its studies on the nutritive value and digestibility of forage crops; and it has carried on a large number of cooperative experiments with fertilizers, also cooperative experiments on the effect of nitrogenous food materials on milk production.

Ohio, by some feeding experiments, seems to have shown that much more stock food per acre can be secured in Ohio from corn than from sugar beets, and they have also had a good deal to do with showing the superiority of shallow over deep cultivation of corn on Ohio soils.

The Mississippi station has done a very important work for the South on the development of the growth of forage plants and the live-stock industries, along with which went a demonstration of the value of cotton seed and products for stock.

Of the stations in the irrigated regions we have an example in Utah, where important work has been done in improving the methods of tillage with special reference to the conservation of moisture, and by studies of alfalfa at different stages of growth, etc.

In Vermont we have special investigations on the chemistry and physiology of sap flow as related to the maple-sugar industry.

In California a large amount of work has been done in the distribution of seeds and plants of improved varieties, in helping the wine industry and the olive industry by investigations on the raising of grapes and olives, and in the making of wine and olive oil.

In Oklahoma effective investigations have been made on the culture of Kafir corn.

In Rhode Island there have been important investigations on the feeding and breeding of ducks and geese.

In Nebraska, the station has had a good deal to do with promoting the growing of alfalfa and winter wheat instead of spring wheat, by which the State has got to be a large producer of wheat, raising some 50,000,000 bushels in 1897. Its investigations of subsoiling in that region have been very important, and have resulted in increasing the yield of corn in some cases from 10 to 30 bushels per acre.

In Arkansas, some practical experiments on economical methods of producing pork and beef in connection with the raising of cotton, have been made with a special view to the improvement of the worn cotton soils.

Lastly, we come to the higher work of the stations, which relates to the new methods, crops, or industries introduced by the stations. There is time to give only a very few examples.

The Wisconsin station has been instrumental in introducing a variety of barley known as the Manshury barley. This increased the average yield several bushels per acre in Wisconsin with a result worth millions of dollars annually to the State alone. This station and the Minnesota station have been largely instrumental in introducing the growing of rape in these States, and it is now grown on thousands of farms to the advantage of the farmer. The Wisconsin station was fortunate enough, after several other stations had made imperfect successes, to perfect a reliable milk tester—the Babcock milk tester—and that has very largely revolutionized the business of dairying in this country.

The Pennsylvania station, and many other stations, have recently been engaged, as you doubtless know, in investigations on sugar beets. This together with what work the Department of Agriculture has done, has shown definitely where good beets for sugar can be grown, so that we do not need to work on that problem any more. The question of manufacture now remains for other people, working along economic and commercial lines.

The Maine station has shown that apples can be raised successfully in Aroostook County, and now thousands of barrels of apples are shipped out of that county annually.

Storrs station, in Connecticut, has made very important original investigations on problems connected with the nutrition of men and of animals, working out the apparatus and methods of experimenting, which can now be adapted to experiments with all sorts of farm animals, and the Department of Agriculture has recently taken up that work in Pennsylvania, and we are going further than anybody in Europe has gone in studying certain problems connected with the nutrition of men and domestic animals.

In Ohio a method of watering greenhouses by subirrigation has been originated, which it is claimed will largely increase the product and make the crops less subject to disease.

In Florida the introduction of the velvet bean seems to have been a great thing for the State, resulting in the saving of thousands of dollars on fertilizers. It can also be used as a forage crop. Individual orange growers say they save as much as \$1,000 annually by the use of the bean. Cassava is a new crop, and seems to be especially adapted to the sandy soil of Florida. One factory for the manufacture of starch from cassava has been built, and it seems that starch can be made quite cheaply from this plant.

The California station has been engaged in soil investigations, especially on alkali lands, and these have been along lines not previously attempted, and a great deal of information has been obtained, which has brought into agricultural use large tracts of land which before were thought to contain alkali in such proportions as to make them useless. This has been an important result.

Speaking of Kafir corn, which was introduced into Kansas by the Department of Agriculture and taken up by the Kansas station, in 1898 over a half million acres of this corn were grown on Kansas land, a value of about \$6,000,000.

Q. (By Representative GARDNER) Does it mature in Kansas all right?—A. I think so. I am speaking generally now; there may be localities where it will not. That is, of course, a dry-soil plant, and that is a great advantage for certain regions of Kansas.

Let me speak briefly of a few hindrances which the stations have in their work, but from which, however, they are yearly escaping more and more. There has been to a considerable extent a failure to understand the real purpose of the stations, and there has been disappointment that they have not undertaken, I might say, more farm operations. It should be borne in mind all the time that the act under which the stations are operating has been framed with reference to the needs primarily of institutions where science is to be used for the benefit of agriculture, so that the stations are to work, so to speak, from the scientific end to the practical, and not to carry on farming operations for the sake of showing what good farming is, after the manner of the model farm or anything of that sort. Ignorance of this fact has often been coupled with a failure to appreciate the needs and requirements of scientific work on behalf of agriculture, so that many have supposed that the workers in such institutions could engage very largely in outside work, such as lecturing, teaching, etc. Now, if the stations are to do their best work, the men engaged in them must give their time very fully to their investigations and must be allowed to pursue these investigations according to the methods

demanding by the investigations, and must not be hampered by outside duties; and a failure to appreciate that by the people and boards of management has often hindered their work.

But there is a general hindrance due to political influence working too actively in the organization of these stations, and it is well that the people should understand that and safeguard these institutions against it. In most of the States the board is appointed by the governor of the State, either with or without the consent of the legislature, and these boards have such terms of office that the membership can be more or less shifted for political purposes, and it has been done too largely. Of course every one can see that this is not the field in which political action is proper, safe, or wise.

Now I want to say in that connection that I am not one of those who take a narrow view of the field of political activity. I think there is a wide field where political influence may properly exert itself, but when it comes to the management of educational and scientific institutions it is impossible for me to see how we can have a good state of things until these institutions are completely rid of personal and political influences and considerations.

Then there have been, as a result of many causes, shifting policies in the management of these institutions, so that the officers have changed too frequently, and that has been a great hindrance to efficient work. We must have men who will stick to the work of agricultural experimenting long enough to accomplish the best work. Another difficulty arises from a lack of proper organization of the stations; the different workers have oftentimes been too independent of each other; at other times there has been too much meddling on the part of the board of management, who should confine their work to general matters. Then at the outset, and, to a considerable extent still, there is a lack of thoroughly trained men for this work. We are making this up every year, but that has been one of the difficulties. The haste for immediate results has been a considerable hindrance. As soon as the stations are established, farmers and others want something to show at once. In most lines of experimenting with which I am familiar we can not determine much in 1 year or 2 years. It takes time, and if you hurry the thing too much you spoil it; and, connected with that, there has been a demand for too many kinds of work. The stations have a certain amount of money, and there are all sorts of questions, a thousand problems in any State, and of course it is not wise for any one station to take up more than a few and work them up thoroughly; but the demand for a little work here and a little there has, in many cases, spread the work out too much.

On the other hand, there are many hopeful indications looking to the strengthening and improving of the work of the stations. Every year they have a better equipment and better trained men; they divide their work more thoroughly among specialists and introduce new lines of work in that way. Then there is being made yearly a clearer distinction between the educational work which the college can properly do and the experimental work which the station ought to do. Finally, we have in an increased measure the cordial support of Congress and State legislatures and the people. I think it is very remarkable how the appropriations for experimental work have been made in Congress without demurrers and how those of the State legislatures have been increased from year to year, evidently with the backing and approbation of the people; and there are many evidences that farmers and people generally approve the work of these stations.

Now, if I may be allowed to sum up in a few words the general results of the movement in this country for agricultural education and research, I would say first, that it has given us a body of trained leaders and experts, so that we are prepared as we have never been before for advanced work along these lines; secondly, we have an up-to-date American literature on American agriculture the like of which has never been seen. Reference has been made to the work done in England, and it is only a few years since we were compelled in this country to depend very largely on English works on agriculture for our agricultural literature. This was unfortunate in many ways; but now we have a literature of our own which is up to the times and from an American standpoint. As a part of this some 50 books have been published within the past few years whose authors are college and station men. Thirdly, there has been a free distribution of a vast amount of accurate and useful information. When you have made all the allowance that you can fairly make for crudity and misinformation which the station and Department publications may from time to time contain, you can still say that a very large amount of accurate and valuable information has been disseminated, and this has been more thoroughly done in the United States than it has been in any other country. This is a special feature of the work which our foreign friends comment upon when they come to have a knowledge of it. In the

fourth place, I think we may fairly claim that the colleges and stations have been an important factor in breaking down the traditional opinion that agriculture is of necessity a nonprogressive art, and this is a work the effects of which will accumulate as the years go by. Fifth and lastly, they have been an important factor in making the state of the ignorant, shiftless, and nonprogressive farmer worse than it used to be. I think this work is also cumulative, because it is becoming clearer every year that if a man is to be successful in agriculture, as in other arts, he must be progressive and seek up-to-date information and ideas.

Q. (By Senator MALLORY.) With reference to this movement of experiment stations, are any of these men appointed by the United States Government?—A. No. The experiment stations are State institutions, each under its local board.

Q. (By Representative GARDNER.) The distribution of the agricultural colleges over the country is shown in your statement, is it not?—A. Yes; generally.

Q. Is there one in every State?—A. Yes; one in every State; at least each has a college in which agriculture is taught.

Q. And an experiment station?—A. Yes.

WASHINGTON, D. C., June 24, 1899.

TESTIMONY OF MR. GEORGE K. HOLMES,

Assistant Statistician, United States Department of Agriculture.

The commission met at 2 p. m., Second Vice-Chairman Gardner presiding. Mr. George K. Holmes, Assistant Statistician in the United States Department of Agriculture, being first duly sworn, testified as follows:

Representative GARDNER: You may proceed in your own way.

The WITNESS: The agricultural element is the largest one in our population. In 1890, 8,500,000 persons were employed in gainful agricultural occupations of all sorts, out of 22,750,000 persons employed in all gainful occupations. Of these 8,500,000 agricultural workers for gain 3,000,000 are agricultural laborers, or those who work for wages, while 5,500,000 are farmers, who constitute the proprietor class, including not only owners, but proprietor tenants.

I mention these numbers not because they are new to you, but to suggest to you to bear in mind how important an element in our population this agricultural one is.

Now, let me proceed to a consideration of the wages and earnings of this labor. Since 1866 the Department of Agriculture has collected statistics of the wage rates paid to agricultural laborers in all of the States and Territories, and the statistics have been brought down to 1895. In the last-named year an agricultural laborer on the average received \$17.69 per month, without board, during his actual employment. This is a decline of \$1.49 from the average of 1893, when the financial depression began and when the farm laborer's wage rate was higher in this country than at any time since 1869, when it was \$19.49 in gold.

I have taken the Department's grouping of States—and I think that the names of the groups will sufficiently indicate where they are—and have computed the average wage rate for each of these groups, giving proper weights to each State in each group with regard to the number of agricultural laborers living in it. In the Eastern States the average wage rate per month without board in 1895 was \$29; in the Middle States, \$23.80; in the Southern States, \$12.71; in the Mountain States, \$30.04; in the Pacific States, \$31.68.

The Department has also collected statistics of the wages of farm labor with board, and I have taken pains to subtract the rates with board from those without board to ascertain how large or small the farmer's allowance for the cost of the board of an agricultural laborer is. The result is that in 1895, as an average for the United States, this allowance was \$5.67; and at no time covered by the investigations of the Department has the allowance been higher than \$7.05 in gold in 1869.

To a person unaccustomed to agricultural conditions throughout most of the country this allowance for board seems exceedingly small; but it is partly accounted for by the fact that in the South it is mostly the custom to feed farm laborers, if they receive board as an element of wages, by issuing rations to them consisting of hardly more than a certain amount of corn meal and bacon. This ration is a cheap one, the allowance for which in the Southern States is \$4.08 per month, and brings the average for the whole country down to the figures that I have given to you, \$5.67.

Here are 8,000,000 workers, using the figures for 1890, having we do not know how many dependents upon them in their families—but very likely 8,000,000 to 10,000,000—who are receiving but \$17.69 per month without board, and then only when actually employed; and I could hardly use figures or other statements better to show how low is and must be the economic condition of this large population group.

I have been able to compute the actual earnings of these agricultural laborers. Of course you understand the distinction between wage rates and earnings, and I want to be sure that I am not misunderstood when I say that I have computed the wage earnings. I took from the last census the average time during which these persons were out of employment for the year 1890 and subtracted it from one year, in order to find the time of employment. This probably gives us a larger period of employment than these farm laborers actually had, because I think that the census figures of idleness are too low in all occupations, especially in the occupation of agriculture. But, however that may be, I have multiplied the wage rate per month without board into the time of employment, which appears to be 11.35 months as an average for the United States and hardly below 11 months in any one State. As the computation stands, the actual earnings of the 8,000,000 of agricultural laborers of this country in the year 1890 amounted to \$645,500,000, or an average of only \$215 per individual during that time.

This is the lowest-paid labor of all the great occupation groups in this country, and the income would hardly seem sufficient to provide subsistence for a family. Of course, it may be that the laborer has a garden, or that he has the privilege of getting his firewood from his employer's farm—and these things are frequently done, and when so are a considerable element of income—but even with considerable allowance for this addition to the total income of the farm laborer, it is a poor one and makes his condition, it strikes me, a lower one than that of any other great class of workers.

In the South his computed individual earnings for 1890 are only \$147 in North Carolina; \$140 in South Carolina; \$162 in Alabama; \$176 in Mississippi, and \$158 in Tennessee.

If the number of these laborers in the whole country were not so large no such aggregate earnings as \$645,500,000 could be shown; but even this sum, as large as it may appear at first, is not as large as the earnings of persons engaged in trade and transportation.

I have been fortunate enough to obtain an estimate of the actual earnings in 1890 of each large class of workers for hire—and by large class I mean the large groups given by the Census Office. These estimates were made by some experts in Washington for a special purpose, and have never been published. Of course they are only estimates, because it would be impossible to ascertain the actual earnings of any large class of persons, especially for the entire wage-working population of the United States; but I am informed that wage-rate averages in the Department of Labor records were largely used for the purpose, with some allowance for idleness.

Well, as I have said, the agricultural laborers received \$645,500,000; persons engaged in trade and transportation received \$745,000,000, or \$100,000,000 more, although their number is given as only two millions; persons engaged in domestic and personal service, their number being about four millions, received \$943,000,000, or \$300,000,000 more than the agricultural laborers did; while persons engaged in manufacturing and mechanical industries received \$2,197,000,000. The number of persons last named is about five millions. It therefore appears that the persons engaged in manufacturing and mechanical industries, who are about a third of the wage earners, received nearly half of the entire earnings of labor during the time covered by this estimate, while the agricultural laborers, who are about one-fifth of the wage earners, received less than one-seventh of the total earnings.

This is the first detailed estimate of the earnings of all of the labor of this country—the first estimate of any kind, except the very roughest—and it may be interesting to you to pursue the subject somewhat further, for the sake of comparisons with agricultural laborers.

The allowance of actual yearly earnings made by these experts is \$235 to fishermen. Please remember that the actual ascertained average for agricultural laborers published by the Department of Agriculture for 1890 was \$215. Well, the persons engaged in domestic and personal service received, it is estimated, \$237; the persons engaged in trade and transportation, \$340; various unclassified pursuits, including lumbermen, quarrymen, stock raisers, woodchoppers, etc., received \$372; miners, \$420; while lastly, the persons engaged in manufacturing and mechanical industries received, it is estimated, \$445. That is the highest average given by

these experts to any one of these large classes of occupations, and of course, does not include board.

Now I want to turn away from this subject to the kindred one of the income of the farmer.

The farmer, you will remember, is known to us as the agricultural proprietor, whether an owner or whether a tenant for money rental or a share of the crop. In all these cases we understand the proprietor to be a farmer in this country. He is not a man in any case who works for hire.

Now the product of agriculture in the United States in 1889 was reported by the enumerators of 1890 to be worth \$2,500,000,000. I am not saying that they told the truth about this, but of course there was no willful misrepresentation. The general understanding is—and I may say in regard to this that I have the opinion of the special agent who had charge of agriculture in the census of 1890, Mr. Hyde—the general opinion is that this statement of the value of agricultural products by the census of 1890 is too low. These values are very difficult to ascertain, and there were not only underestimates but omissions. Mr. J. R. Dodge, formerly statistician of the Department of Agriculture, estimated the value of the farm products in 1889 to be about \$3,500,000,000, after allowing for some duplication, but this estimate is merely an estimate, and not being acceptable as sufficiently founded upon facts, it is safer to use the census figures with the understanding that they are certainly too low. Let us see how this sum was distributed.

We are able to determine several of the recipients of this product, and approximate, in some cases quite accurately, the amounts that they receive. The wages of the 3,000,000 agricultural laborers during the 11.35 months while they were employed, as I have stated before, was \$645,500,000.

The enumerators of the census reported for each farm the value of the commercial fertilizers that were used on the farm during the agricultural year, and their value was \$38,500,000.

Then, again, it was ascertained in the census that the mortgages on the farms occupied by owners amounted to about \$1,000,000,000, and the interest on these mortgages was \$76,750,000. How much of the product of agriculture went to pay the interest on crop liens has never been ascertained, but I have made inquiries of scores of cotton planters and cotton dealers and other persons who are familiar with the conditions of cotton raising, and I have estimated that the interest on the crop liens in the South, and these are mostly liens on the cotton crop and very little on any other crop—amounted to \$120,000,000 in 1890. This is at the rate of 40 per cent on the debt for the year, and all cotton men tell me that this is a moderate estimate.

The taxes that farmers paid in 1890 are of unknown quantity, but I have taken the average tax rate on all property at its estimated true value for that year, as reported by the census, and this was 0.73 of 1 per cent. At this rate of taxation on the farmers' entire capital the amount of taxes paid by the farmers of the country in 1890 was \$116,666,000.

Now, before I state the remainder of this distribution of the product of agriculture, I ought to say that I am going to give you the result that I am aiming at in two forms.

In the first place, I am going to allow the farmer a theoretical interest on his farm capital after deducting the mortgage interest that I have already allowed, and then see how much of the product there is left for the payment of wages to the proprietor farmer. Then I am going to allow the farmer wages before allowing him interest on his farm capital, and see whether he has any product left for the payment of interest to himself.

In the first instance I allow the farmer a theoretical interest at the rate established for farm mortgages by the census of 1890, which was 7.7 per cent, and after deducting the mortgages on the farms occupied by owners this rate of interest multiplied into the remainder of the farmers' capital, as stated by the census, amounts to \$1,050,000,000. After taking the foregoing items of distribution from the value of the products of agriculture there remains only \$410,000,000 to go to nearly 5,500,000 farmers, and this gives them only \$6.83 a month for 12 months as an equivalent of wages.

Let me now reach a conclusion in the other alternative. I will allow wages at the rate of \$22.61 per month for 12 months to the nearly 5,500,000 farmers and that exactly absorbs this remainder of \$410,000,000, so that, assuming that our statistics are not so very far from the truth, it appears that if you allow interest to the farmers on their farm capital they earn substantially no wages; and, on the other hand, if you allow them no interest they receive but \$22.61 per month as wages.

This is a rather bold way in which to attack this problem, and one of which I do not fully approve, in view of the inaccuracy of some of the statistics.

The value of farm products as reported by the census being unquestionably too low, of course the remnant of product allowed for the earnings of the farmer after the allowance of interest is made is too small, but I am inclined to believe that, as faulty as the statistics of the value of farm products may be, it is nevertheless probable that one of these alternative conclusions is at any rate significant of too much of a competition.

Now the question naturally arises, why is the farmer in this situation? This is a question that has been agitating the farmer's mind for a considerable number of years, and has interested students, scholars, and economists, and political and social agitators, and has received many sorts of answers. Probably I can give you nothing new in the way of answer myself, but I want to say briefly that my explanation is that the farmer and farm laborer do not produce enough wealth, as measured in price and exchange, to make the situation any better than it is.

It would seem that the application of unskilled human labor, even with the aid of the very excellent and labor-saving machines and implements that are used in agriculture, fails to produce wealth enough per capita of workers to afford the payment of better wages, and to return to the farmer after the sale of his products enough to pay him both full interest and good wages on the one hand, or, if we allow him no interest at all, not enough to return to him a respectable compensation for his labor.

It is in evidence from census returns that the agricultural product in the latest census year was only \$293 for each farmer and farm laborer. In this computation I have not included the wives and children of farmers and farm laborers, unless it has been the case that they received wages for labor on the farm. As I have said before, it is confessedly a low valuation of farm products that the census has reported, so that the average I have just mentioned is one that is too low.

The various parts of the country differ materially with respect to the average value of the agricultural product per worker, and I have had some computations made for the five geographical divisions established by the census of 1890, in order to see how the different regions vary.

The lowest per capita product—and please bear in mind that when I say “per capita” in connection with this matter, I mean per capita of farmers and laborers engaged in agriculture—the lowest per capita product is in the South Atlantic States, where it is only \$177. These are cotton, and to some extent, tobacco States.

The next group of States in order is the South Central, with an average of \$211. These are also cotton States, and to some extent, tobacco States.

The States of neither of these groups are exporters of grain nor of animals and dairy products. Of course there are minor exceptions to my sweeping statement, as, for instance, the exportation of cattle from Texas, but my statement is, I believe, substantially true.

Upon coming to the North, the agriculturist produces a higher product in value. In the North Central States, which contain most of the great corn and wheat States of the Union, and which are prominent as producers of live stock and animals and dairy products, and States also where agricultural machines and improved implements are much more in use than in the South, in these States, the product per individual is \$362, or more than twice as much as in the South Atlantic States.

Next in order of product per worker are the North Atlantic States where the amount is \$380. These are the States of more dense population, with more diversified agriculture, with the more numerous cities and large towns, and with the better local markets.

Last among the groups of States is the one called the Western, for which the average agricultural product is \$519. This is the largest of all, and if our theory, together with the information that we have in a general way with regard to agriculture and horticulture, holds good, then it is this highest product of agricultural wealth in the Western division of States—which includes the Pacific States—that permits the comparatively high rate of farm wages in that part of the country. The statistics of the Department of Agriculture show conclusively that the highest farm wages are in the Western group of States, and that the Eastern States stand next, and these are the groups of States that stand highest in the value of the product of agricultural wealth per worker.

A larger value is produced in manufacturing than in agriculture, namely, \$806 per worker, and wages are very much higher in the manufacturing industries than they are on the farm. There must be a product of wealth before the wages can be paid, and other things being the same in different industries, wages can go up only as the product permits them to go up.

Now the fact is that the farm prices of most of the agricultural products are

and have been for years declining. Without regarding it as necessary to mention exceptional years, I may say that the prices of most of the principal products on which the farmer depends for his income have been declining. I would except most of the meat, dairy, and poultry products; but notwithstanding these important exceptions, the farmer has had to face declining prices, and in order that he might hold his footing he has needed to depend upon reducing the cost of production, upon facilities and cheapness of transportation, upon an increase of product, and upon combinations with his fellow farmers to keep up or increase the farm prices of his products.

That his product has increased per acre, generally speaking for all agricultural products, is very doubtful. The statistics that we have show small changes, one way and another, but I doubt that these statistics are precise enough to enable us to place much dependence upon fine distinctions. They are principally trustworthy in pointing out distinct movements one way or another, or as indicating stationary conditions; but the statistics of agriculture in this country do not indicate any distinct movement towards intensive agriculture, although that movement is taking place, it is well known from observation in special directions.

So much for the farmer's dependence upon increased production in order to increase his income.

Transportation has done great things for him.

One would hardly need to say more than that the freight rate on wheat per bushel from Chicago to New York had decreased from 33½ cents to 12 cents since 1867, to express strongly the enormous decrease in freight rates on agricultural products in general and to show how important this reduction has been to the farmer.

If I need to reinforce the statement that I have just made with regard to the freight rate on wheat, I will mention corn. The all-rail rate on a bushel of corn, on the average, from Chicago to New York was 36½ cents in 1858, and it declined to 11½ cents in 1897.

A reduction in freight rates, which has been going on all over the United States and across the oceans, has given the farmers a new problem to solve. It has given them a world market for several of their largest, and in the aggregate, most remunerative crops, and for their cattle and swine.

This reduction in the rates of transportation has created millions and millions of competitors for our farmers.

It has made them competitors with one another, and perhaps this is of as great importance as the fact that foreign competitors have been created. The Eastern farmer, when he found himself placed in competition with the West, had to change and diversify his agriculture materially, and has been able to save himself only because of the density of population and the proximity of cities and towns, and by the use of fertilizers which he has saved and prepared himself.

It may be that this gradual extension of the area of competition and of the number of agricultural competitors has largely been the cause of the falling prices of those products whose prices have fallen and of the prevention of the further increase of the prices of those products that have increased in price. And yet, were it not for the present means of transportation, the farmer would be living in the ways of the backwoods.

I will turn now to say only a few words with regard to another dependence that I mentioned that the farmer might have for increasing his net income, and that is through decreasing the cost of production.

It is difficult to form an opinion with regard to this. The most that we can do is to draw inferences, because little is known with regard to the cost of producing any agricultural product except cotton.

We know unstatistically that the farmer has increased the use of machines and implements, and that he is using better and more labor-saving machines and implements than he ever used before, and we think that we know that the human labor element in agricultural production is a diminishing one relative to the amount of the product.

I have been allowed to get some information from the office copy of the report of the Department of Labor on hand and machine labor, and I will make a few comparisons for you.

First, let me compare the raising of 1 acre of corn in 1855 with the same acre in 1894. In the former year the shovel plow was used for marking the rows and for cultivating, the hoe for planting, and a peg in husking by hand. The stalks were cut with knives, and cut for fodder with an old-fashioned cutter turned by hand, and the corn was shelled by hand.

In contrast with this is the raising of the same quantity of corn (40 bushels) on the same area (1 acre) in 1894, with the use of the best implements, machines, and methods. The plowing was done with a gang plow and corn planter; a

machine for cutting and binding stalks, a combined husking and fodder-cutting machine, and a steam cornsheller were used.

The increased effectiveness of labor when aided by machines is clearly brought out in this comparison. Machines and improved implements in raising corn reduced the human labor cost per bushel from 35.77 to 10.57 cents, or 25.20 cents, or 70.5 per cent, and reduced the time of human labor from 274 to 41.3 minutes, or 84.9 per cent.

A comparison of the Department of Labor schedules discovers the following reductions in the cost of human and animal labor, per bushel, caused by the use of machines and implements: Corn, from 12.58 to 8.27 cents; wheat, 19.17 to 10.18 cents; wheat (another pair of schedules), 20 to 5.60 cents; oats, 8.88 to 4.07 cents; rye, 21.01 to 17.20 cents; barley, 12.94 to 8.54 cents; Irish potatoes, 5.99 to 2.72 cents.

The reduction of the time of human labor, per bushel, is as follows for selected pairs of schedules: Corn, from 58.1 to 22.7 minutes; wheat, 183.2 to 10 minutes; oats, 90.6 to 10.8 minutes; rye, 151.2 to 60.4 minutes; barley, 116.2 to 6.8 minutes; Irish potatoes, 21.7 to 10.4 minutes.

Q. (By Senator MALLORY.) Does that mean the minutes of human labor which are given to each bushel?—A. Yes; from the very beginning of the year, from the time of the plowing to the harvesting and stowing away of the grain in the granary. My last statement pertains to human labor. In the previous case it included animal labor.

There is a great difference in results between the time when, as ascertained by the United States Department of Labor, 20 minutes of human labor were required to husk a bushel of corn by hand, with the use of a husking peg, and 102 minutes to haul the stalks required to produce a bushel of corn to a barn and cut them into fodder, and the time, as at present, when 17½ minutes are sufficient to haul the same stalks to a husker and, by the use of a machine operated by steam, to husk the corn and at the same time cut the stalks into fodder; and there was a transition from one agricultural age to another when a man ceased to expend 100 minutes of labor in shelling a bushel of corn by hand, and employed a steam sheller by which a bushel of corn is shelled in a minute and a half. When farmers reaped their wheat with sickles and bound the straw by hand, hauled the sheaves to the barn and thrashed the grain with flails, these operations, applied to one bushel of wheat, required the labor of 1 man for 160 minutes, whereas this work is now done, by the use of a combined reaper and thrasher, operated by steam, with 4 minutes of human labor.

Whether the numerous savings in agricultural labor have, on the whole, enabled the farmer to save to himself a larger net income, I am unable to say.

It may be that the effect of all this has gone into lower prices, perhaps partly into higher wage earnings of farm laborers—for it is a fact that the wage rates of farm labor have, on the whole, been increasing ones. But if the farmer is able to extract from his product, above the cost of production, a larger income than he has heretofore been able to extract, it is not an increase of which he is sensible.

But in any discussion of this I should insist that the much increased quality in the general standard of living and in the farmers' living should be taken into account.

This is a new age to the farmer. He is now, more than ever before, a citizen of the world. Cheap and excellent books and periodical publications load the shelf and the table in his sitting room and parlor. He travels more than he ever did before, and he travels longer distances. His children are receiving a better education than he received himself, and they dress better than he did when he was a child. They are more frequently in contact with town and city life than he was. They have a top buggy, and a fancy whip, and a pretty lap robe, with a fast stepping horse, whereas their father had an old wagon and a less expensive horse. The farmer's table is better, too; his food is more varied, and more of it is bought by him and less of it is raised on his farm.

Now, all this costs money, and if the farmer has nothing more to show for an increased net income, if he is receiving one, than his advanced standard of living, it is, after all, a good deal of a return.

In recommendations that you may make with regard to trusts, I beg that you will bear in mind the immense agricultural interests of the country. The farming element constitutes one-third of our population, and, while the capital owned by this fraction of our population is small, compared with that invested in manufacturing and mechanical industries, yet after all it is numbers of people rather than dollars of wealth that are entitled to primary consideration.

A trust is not restricted in its nature to an association of men who are millionaires and manufacturers of refined sugar, or of cottonseed oil, but it may include common, everyday farmers, dairymen, and fruit growers, and, as a matter of fact,

these men have been organizing trusts and conducting them more or less successfully, and are anxious to do so, in all parts of the country and in some cases upon a large scale.

There is a trust movement among agriculturists which has obtained a successful foothold after many failures, and the fundamental reasons for this movement I will briefly state.

Farmers are so numerous that they are frequently and severely subject to competition with one another in the disposal of their products; and, probably more so than with any other class of producers, are naturally at the mercy of the middlemen, or the men who buy directly from them and dispose of the farm products to wholesale dealers or consumers.

The farmer is more or less isolated; he lacks capital; unaided and alone he is generally unable to reach consumers directly; and so, operating independently, he is compelled to accept the services of the middleman and the middleman buys from the farmer practically upon commission, and sells for cash or upon short time; and thus, without furnishing much, if any, capital himself, compels the farmer to supply the capital for his operations and makes the farmer suffer for losses by bad debts or any other causes, to say nothing of the frequent dishonesty of the middleman and his false reports with regard to the prices he receives if he sells upon commission.

You may call to mind some neighborhood in which tobacco is produced. It is visited by perhaps one or two tobacco buyers. They are in tacit, if not express, agreement as to the prices they will pay, and since practically the individual farmer can not reach a tobacco warehouseman or manufacturer in any other way he is compelled to accept what these buyers offer.

The farmer, acting alone in his dealings with men of concentrated capital and power, as is generally the case with the men and associations that buy and handle his products, is in a position that is economically weak, and I believe that it is fair to say that one of the reasons why the farmer has been and is discontented is because he has fought the battles of production and trade single handed.

Before proceeding to state the extent to which farmers have carried the trust idea and are disposed to carry it, I want to state what my understanding of a trust is. I should define a trust to be an association of individuals, partnerships, or corporations for the purpose of regulating, maintaining, or raising prices or rates, or for the purpose of regulating the management of the undertaking, in which purpose there is a considerable degree of success, but not necessarily that of a monopoly. Whether the operations of such an association should be of large dimensions before it may properly be termed a trust, is a question; but apart from this the essential principles are the same, whether the association controls the hop crop of Oneida County, N. Y., or the hop crop of the United States; and any law that may be formed by the United States or by any State I should suppose would be unable to draw the line at any particular place with regard to the extensiveness of the operations of the association.

The Department of Agriculture has endeavored to obtain the names of the associations of farmers in this country that are commonly termed cooperative, and among these associations are many that are virtual trusts. For instance, there is a milk-producers' union that supplies Boston with milk. Until some years ago the milk market situation in Boston was this: The buyers, that is the dealers in Boston, had an association, and although a milk producer in New Hampshire may have been selling to a dealer under contract directly and nominally with him, yet, as a matter of fact, the farmer was dealing with this association of milk dealers, because each individual dealer was acting in agreement with the combination of dealers, while the farmer had to deal with this combination unaided.

The farmers were at a great disadvantage, contracts being made under such unequal conditions, and in the course of time they formed an association for the purpose of dealing in a body, through their representatives, with the representatives of the Boston milk dealers.

As the business is now carried on, representatives of both organizations meet every year and agree upon prices for the remainder of the year. This arrangement is satisfactory to both parties, and the individual farmer finds himself in a position much better than the one which he previously held when making his bargain alone. He has back of him the entire combination of farmers that supply milk to Boston.

To give another instance of an agricultural trust, let me mention the comprehensive and successful one of the California fruit growers. They were compelled to form a trust for the purpose of getting remunerative prices, for the purpose of

suppressing competition among themselves, for the purpose of getting lower freight rates, and for the purpose of finding responsible customers in the East and elsewhere.

As the matter stood, an orange buyer, for instance, would go to an orange grower and offer him a certain price for the pick of his crop. The fruit grower, not being satisfied with the offer, would decline it, and the buyer would decline to buy, just as subsequent buyers would decline to do, because they were able to go to neighboring orange growers and obtain the oranges they wanted at the low offer that they had made. The result was that the fruit growers, without knowing what the market was or was to be, without knowing trade conditions and through freight rates, and without being able to obtain low freight rates on small shipments, were eventually compelled, in their own interest, to form what are known as "exchanges."

The fruit growers of Santa Clara Valley, for instance, have formed a trust for the purpose of suppressing competition among themselves as well as for the purpose of having an expert manager to become acquainted with the conditions of the market and make their sales for them. And so there have grown numerous fruit associations all along the Pacific coast, embracing oranges, lemons, various citrus fruits, grapes, and English walnuts, and all the other fruits for which California has become famous; and these associations are coordinated by a central exchange in San Francisco, so that the entire fruit business of California is in the hands of a trust. It is not called a trust, but it has the essential elements of a trust, its objects being, among other things, to suppress competition among fruit growers and to regulate and perhaps raise the price of fruit.

Q. Is that fact established, that one of their objects is the suppression of competition?—A. Well, it is one of them.

Q. Or to secure the benefit of good prices by combining?—A. It is to combine all their fruit, you know, and make a sale of the fruit of all members or many members at the same time.

Q. In suppressing competition, it does not lessen the product, does it?—A. No; not necessarily. I do not understand that they undertake to lessen the product.

Mr. FILLMORE MOORE: They discourage the production of inferior fruits by establishing a standard that does not allow inferior fruit to be put on the market.

The WITNESS: There is no other such immense fruit trust in this country, but there are similar ones in Florida, and in various parts of western New York, New Jersey, Ohio, Michigan, and in nearly all of the other fruit-growing States.

For many years, at irregular times, cotton planters have held conventions with the express object of limiting the production of cotton and of raising its price.

These conventions have never accomplished anything, although their purpose has been practically to form a trust of cotton planters, with the object of controlling the cotton market. It is not necessary to state why their intentions have failed, but there may come a day when their intentions will succeed, and when that day does come we shall have a gigantic trust, and just as distinctively a trust as that of the cotton-seed oil manufacturers.

I mention these as some of the more prominent instances of the trust movement among farmers and to show how extensive it is becoming.

Whatever legislation is to be enacted with regard to trusts must necessarily apply to this farmers' movement, and I beg to suggest that it should not be enacted without a recognition of the fact that this movement has been beneficial, in no unreasonable sense, to a large fraction of our producers.

Now, I should like to say a few words with regard to cooperation among farmers. This has been and is an extensive movement. The Department of Agriculture has obtained the name and address of nearly every cooperative association in this country that is maintained entirely or mostly by farmers. The list contains the names of many about which there is some doubt with respect to their cooperative character, but, with some uncertain allowance for this element, it is probable that farmers are now maintaining in this country about 5,000 cooperative organizations, not including irrigation associations. These include cooperative insurance, cooperative buying of farm and family supplies, cooperative selling of farm products, the maintenance of cooperative stores, small factories and shops, many hundreds of cooperative butter and cheese factories, cooperative elevators, warehouses, lumber companies, milling companies, cotton-ginning associations, telephone lines, and so on through a long variety of undertakings, and in addition to these there are thousands and thousands of irrigation canals and ditches in the arid regions.

Cooperation among farmers has, it is true, often been a failure, but it has at the same time, especially recently, been unquestionably successful, and the failures and successes indicate in what respect some small legislation might be helpful.

If anything can help the cooperative movement among farmers it would help a movement which, if well conducted, is conducive to their welfare. It tends to eliminate the middlemen, makes the farmer more of a capitalist, tends to make him save, cultivates his knowledge of business, makes him more self-reliant, and perhaps, most important of all, unites in one interest both capital and labor.

I suppose that it would be beyond the province of the United States to legislate on the subject of cooperation, but it would be permissible to recommend to the States to outline more or less in detail some legislation with regard to the subject. The difficulties that the cooperative undertakings of the farmers have encountered have been incompetent management, dishonest management, and lack of capital. Now, it is impossible to legislate honesty and ability into mankind, but the law may prescribe certain requirements which will bar out the incompetent and the dishonest. For this purpose I would suggest that a cooperative association, when incorporated, should be subject to the supervision of a State officer or commission such as that to which banks and insurance companies are subjected; that is, a supervision consisting of an examination of accounts and with a publicity of the business. This, I believe, would protect many a cooperator who does not know how ill the business of his association may be conducted until it is too late, and until the collapse follows.

I desire to say but a few words more, and these relate to the crop-lien system of the cotton States. By way of description, I will simply remind you that it is largely the custom of cotton planters and their tenants to use their credit with the neighboring merchant for the purpose of obtaining their plantation and family supplies in advance of the maturing of the crop, and this credit is often obtained even before the cotton seed is planted. The trouble with this system is, that it permits the planter and his tenants to live in the future, to be improvident, to be hopeless with regard to their situation; and it is the direct cause of the enormous production of cotton in this country, with the constant tendency towards overproduction; and is the cause of 5-cent cotton and 4½-cent cotton.

Now, the cost of raising cotton has recently been determined by the Department of Agriculture to be 5.27 cents per pound, and the price of cotton at the plantation has latterly gone below this. The reason for this is that the merchant, in order to cover the credit that the planter and the tenant have asked him, and to feel financially sure of covering that credit in case of partial crop failure, is calling for the production of cotton, cotton, and more cotton.

I will not say that it will be a wise thing for any cotton State suddenly to extinguish this privilege of credit against the future crop, but I believe that it would be well, in the way of a beginning, for the States to limit the credit to a certain percentage of the value of the cotton produced, this percentage to be a diminishing one year by year. This would gradually compel the planter to produce the principal portion of the supplies used on his plantation, and would practically and eventually prevent him from purchasing his bacon in Chicago, his wheat flour in Minneapolis, his hay in Iowa, and his corn in various parts of the West. As all persons know, who are familiar with the cotton situation, this is what the cotton planter should avoid doing; and I think I may safely appeal to the member of this commission from Georgia to sustain me.

Let me summarize briefly the three points that I attempt to make. First, I claim that any legislation aimed at the destruction or regulation of trusts will apply to numerous farmers' organizations mainly having the object of marketing farm products. These associations are an outgrowth of the economic necessities of the times; they intend to make remunerative prices for farmers, and, as far as now appears, they have not abused their intentions; they try as much as possible to do away with the middleman, who, as he conducts himself to-day, is one of the leeches of American agriculture. While I object to the suppression of these agricultural trusts, I have not the slightest objection against their regulation. Indeed, I believe in the regulation of trusts and of corporations. I was reared in a State that was the pioneer in the regulation of corporations—the State of Massachusetts; and, in accordance with my political rearing, I should like to see the business of trusts and corporations compelled to be thrown open to the light of day rather than to be indiscriminately suppressed.

My second point is that industrial cooperation should be strengthened by legislation that will promote honesty and efficiency of administration, and this by means of examination and publicity of accounts and manner of doing business.

My third point is that that curse of the cotton States, the crop lien system, should be gradually extinguished by limiting the credit that may be placed on the cotton crop to some certain percentage of its value, and by making the limit a diminishing one year by year until some low minimum ratio between the credit and the value of the crop shall be reached.

Q. (By Representative GARDNER.) You made a deduction from statistics on the wages of farmers, in which you stated that if interest were not allowed the wages would be equal to about \$22.50 a month?—A. Yes.

Q. In that calculation are such items as rent for buildings that he keeps—his living comes out of the farm—taken into account?—A. The rent is taken into account in the form of interest; but it is doubtful if farmers, in reporting the value of their products to the census enumerators, have included living. I doubt that very much. They may have done so to some extent.

Q. You stated that there was no general movement in the direction of intensive farming in the United States. Is it not true that the consensus of action among agriculturists at this time discourages that movement in this way, that they advise against the expenses for mineral fertilizers and other expensive methods of intensive farming, and advise the cultivating of less soil and keeping it up for crops to plow in?—A. I think that that is their plan, although I do not profess to be familiar with the general policy of the experiment stations with regard to that.

Q. (By Senator MALLORY.) I understand you, in your plan of organization of cooperative associations of farmers to advocate the placing of the control in the State authority. Do you think that Congress could not exercise any such power over those corporations so chartered or organized as are engaged in interstate commerce?—A. Well, I suppose so. I do not profess to be capable of giving you a legal opinion on such a subject.

Q. Would it not be better, if it were possible, for one power to exercise that control than for 40-odd?—A. I should rather think so, because the States will not go into the movement universally. There might be a pioneer or two. And as between the two, I should prefer that Congress should do it.

Q. You spoke of the advisability of the legislatures of the cotton States limiting the percentage of liens contracted on the crop. Would not a difficulty in that arise from the character of the legislatures themselves in those cotton States? The majority of the legislators in the cotton States are generally cotton raisers or connected with the cotton raisers.—A. The cotton men are beginning to realize in the South that they are the victims of a bad system. I have heard them say so time and time again—the cotton men I have met in the last 8 or 10 years.

Q. They say they are forced to it. A witness testified to that here a few days ago. He said he had deliberately tried to get out of it.—A. They tried that in Alabama. They had a proposition to get out of it, not to modify that crop-lien system. They had to give it up. The legislature could not pass the act.

Q. I understand your objection to this lien system is not merely that it causes an overproduction, but it is also a very exorbitant drain upon the resources of the farmer?—A. It is dreadful. The rate of interest on the liens on the cotton crop of the South, it is safe to say, probably averages 40 per cent a year. All cotton men will agree that it is at least that. The store system of the South is a sort of a peonage; that is what it amounts to with the cotton planter.

Q. And it has created with successive years a prospective debt to the producer?—A. Yes; they are a year behind; at least a year behind.

Q. So, in fact, the only way to stop the store-lien system in the South is to shorten the production of the crop and make better prices, or a price system of some kind, or a longer time in the payment of those liens?—A. You can not shorten the production as long as the merchant can say to the cotton planter, "You have got to raise so many acres of cotton this year," and that is what they are doing.

Q. As a statistician, do you think that a matter of 500,000 bales from America make a very appreciable change in the Liverpool market as meeting the world's product?—A. That is a difficult question to answer. It is a good deal more of an economic question, not merely with regard to cotton, but with regard to an export surplus. It is a good deal of a question as to what determines the home price. But we do export enough, I think we all agree, to determine the home price.

Q. Would you not suggest a remedy this way, as a statistician, that instead of depending upon the Liverpool market we should manufacture it right here and then export the manufactured goods, holding the American wages at home?—A. I would like to see that done, of course. I believe in home production, and it has grown enormously. The number of cotton manufacturers and cotton planters has increased enormously.

Q. And not lessened on the part of New England?—A. I think not; not so far as I am aware.

Q. (By Mr. A. L. HARRIS.) You spoke about the cooperative marketing of milk at Boston. Have you any statistics in regard to the price the producer has to sell his milk for and the price that the consumer has to pay for it?—A. I am not aware that our Department ever went into that. We each of us know how

much we pay in our own cities—how much we have to pay for milk—but we have no statistics so far as I am aware.

Q. You have never made any investigations?—A. No.

Q. You say you are not certain that the enumerators are able to get the full value of the product of the farms when the farmer gives in his product for the year?—A. It is doubtful if they do. It is probable that they omit to include the farmer's garden, which is worth \$25 or \$50, and omit to give certain products on the farm; and sometimes he does not, we reckon.

Q. He is more apt to give what he sells?—A. Yes; but there may be a duplication, because the farmer may include so many hundred bushels of corn and at the same time include the steers he sells that he fattens on the corn. He may do that more or less, and there is a duplication on that to some extent, but nobody knows to what extent. You can not draw any very fine distinctions.

Q. Has the Department ever made any calculations as to the average cost of producing a bushel of wheat?—A. Some years ago, about 1893, the statistician of the Department made an investigation of the cost of producing wheat and corn; not the present statistician. I do not know whether they are generally regarded as trustworthy or not.

Q. Can you tell what they were?—A. No; I do not remember what they were; and the method of the investigation and the form of the schedule and all that, are not known to-day. So, in the absence of having information in regard to the schedule and the method of conducting the investigation, I do not like to say or express an opinion as to how trustworthy the figures are.

Q. (By Senator MALLORY.) Relative to this proposition of limiting liens on prospective crops, what is the method by which the liens are made now?—A. Well, the farmer makes up his mind as to about how much credit he wants and the merchant says, "Well, you produce so many acres of cotton," and the merchant sees that he gets a good margin against a possible crop failure.

Q. And your idea is that the merchant should not be permitted to advance only a certain amount?—A. That will compel the cotton planter to produce his own bacon. He should not be obliged to buy his bacon in Kansas City or Chicago.

Q. Not only that, but would it not probably diminish the amount produced?—A. Yes, it probably would; it would raise the price of cotton to the farmers, probably, at least, to the extent of compensating him for the cost of producing.

Q. Have you thought of the practical method by which that could be accomplished: what kind of a law could be enacted to put that restraint upon the freedom of the merchant to contract?—A. Well, I should say a simple law of perhaps one section would be sufficient for that, just limiting the percentage of incumbrance that can be placed on a crop prospective or actually in the ground, and I should have that a diminishing percentage year by year.

Q. Will there not be a question as to whether the legislature would have that power?—A. They might mortgage a crop before it goes into the ground, as they do now, because they have the permission of the legislature. It could not be done at common law.

Q. (By Mr. FARQUHAR.) You seem to be pretty hard on the middlemen. How is it possible for the agriculturists to get along without the middlemen?—A. The agriculturists can not get along without the middlemen. The middleman is a necessary link between the producer and the consumer not only in agriculture, but in all industries. But what I would like to see done is for the farmer to become his own middleman. The service performed by the middleman must be performed by somebody. Of course distribution must take place, whoever does it, and the farmer should do it himself.

Q. (By Mr. KENNEDY.) You want the farmer to make the profit and not have somebody else have it all the while?—A. Yes; that is the California plan.

Q. (By Mr. FARQUHAR.) Owing to the perishable condition of fruits, would it not be a difficult thing to assemble all those productions together into a central point before distributing?—A. Yes; of course the cooperative nature of the movement with respect to the assembling and marketing of fruits has its limit. At the same time it has been developed to a great extent all up and down the Atlantic coast all the way from New York City to Florida and all along the Pacific coast it has been developed to a great extent in the truck-garden business and the fruit business.

Q. (By Representative GARDNER.) Has not this been its utmost development along the coast: To reach the New York market the farmers have organized into associations or unions. By getting together they have been more able to make proper arrangements of transportation at more opportune times, probably through cars, where before it had to be changed from car to car; and then any such bargains as they were able to make with one or more markets are not discounted for

handling their products, because they come in large quantities; they are the products of the union and not the products of individuals. Is not that the sum total of the advantage they have received up to the present time in the markets?—A. Those are the principal points of advantage so far; yes. I do not think they have raised the price of farm products—truck gardening.

Q. But they have reduced the cost of transporting them?—A. Yes; by having carload lots and by dealing with a great railroad corporation as a big body of farmers.

Q. What has been the result of the observation, if there has been any by the Department, of these associations extending credit to their members?—A. They advance cash. These associations of farmers require cash for sales. They do not buy on credit at all when they conduct a buying business.

Q. Are there not some that buy for their members on credit?—A. I know of granges that have gone into that business—the Farmers' Alliance people.

WASHINGTON, D. C., April 8, 1898.

TESTIMONY OF REV. PITT DILLINGHAM.

Principal Calhoun Colored School, Calhoun, Ala.

The commission met at 10.45 a. m., Vice-Chairman Phillips presiding. Rev. Pitt Dillingham was introduced at 8.20 p. m., and testified concerning negro labor in the "black belt" of the South and its education, as follows:

Q. (By Mr. A. L. HARRIS.) You may state your name.—A. Pitt Dillingham.

Q. Your occupation?—A. Principal of the Calhoun Colored School, Calhoun, Ala.

Q. Now, without interrogatories, you may make such statement as you have in your mind in regard to the condition of labor in the "black belt."—A. I would like to say to the gentlemen of the commission, to begin with, that perhaps it was a little rash for me to accept the kind invitation to speak this afternoon, but feeling that it was doubtful whether I should have any other opportunity I used it. It would be possible, of course, to bring you later a carefully written out, detailed statement. I am on my way North, and coming to Washington and going to see Dr. Curry, I found him profoundly interested in the question of the nation's taking hold of the education of the colored people. On going to see Commissioner Wright, I was told of this Industrial Commission and of the subcommission having to do with the condition of agriculture and agricultural labor, and I at once felt that I would like to know what was to be done in the study of agricultural labor in the black belt. I find, by going through your topical plan of inquiry on agriculture, that the questions which you ask are the questions which we would like to have asked down there, and the only thing that we hope is that you are not going to pass us by. We feel that the time has come when it is possible to turn on the light and make an investigation in regard to some of these matters bearing upon the condition of the new American citizen in the black belt; in other words, it is no longer a race question; it is no longer primarily a political question; it has become a sociological question and a labor question. We find at last it has entered into the universities. You find economists devoting their attention to this question. In connection with this, those of us who are living down there and trying to do something feel deeply the fact that so far, even though a generation has passed since the nation emancipated the colored people, practically nothing, really, has ever been done by the Government in the way of careful inquiry into the conditions of this new citizen. We realize, too, that this is a very complicated question; that it can not be answered by any one man. We feel that if this commission should find it wise, if they should see their way to conduct investigations which would throw light upon the conditions of agricultural labor in the black belt, it would have a value which it is rather difficult to estimate. I believe you are likely to underestimate rather than overestimate its possible good consequences. In other words, to meet the very thing that Dr. Curry was speaking of this morning, the question of whether or not the nation is going to feel any responsibility in regard to this matter, it seems to me that an inquiry conducted by this commission in regard to agricultural labor in the black belt will perhaps do more than anything else. It will bring home to the mind of the nation the urgency of the situation and the nation's responsibility.

I said that I would try to give some facts in regard to the condition of things, as we see them, in Lowndes County especially. I ought to say that if there is any

reason why I have a right to say a word here this afternoon, it is simply because I have been living for some five years in this county, which is a typical black belt county, one of the blackest in all the black belt, the county selected by Mr. Booker Washington when the Calhoun Colored School was started some seven years ago. I am not here to tell you about the school except as it bears upon this question of agricultural labor. The reason why the school was started there was because, in the first place, the cotton belt is where the negro is—that is, an immense per cent we know are down there. In the so-called black belt you have the highest percentage of colored as against the white—something over 60 per cent. The desire, therefore, was to get into the black belt itself, and getting there we got at once into the agricultural South, and we found the field hand of the South. When the school bell was rung, it was rung out over a farm as well as a schoolhouse. We wanted to give agricultural education, and we were thinking of what we could do to help the State of Alabama, among other things, in bringing some kind of elementary agricultural education to bear in the country districts of the South. Then, if I mention one other fact, you will see our situation. Besides conducting this school, we have around about us at the present moment some 70 families of negroes who are buying lands, 50-acre farms, at an average of about \$7 an acre, on 3 years' time at 8 per cent interest. In other words, we have really a sort of farm village. At the center there is a graded school, running from kindergarten up through the primary and grammar grades, giving also agricultural instruction and training for the boys and domestic instruction and training for the girls. We are working for the farm and home, trying to turn out farmers and farmers' wives. We are saturated, as it were, with this agricultural situation. We have, for seven years, been coming up against all the facts of that situation in one way and another, all the disagreeable and hard and trying facts, and all of the hopeful ones, and are feeling exactly what we understand to be the feeling of every man, whether a Northern or Southern man, every educated man who thinks about the situation, and that is that the condition of things is bad, that it is urgent, that it is dangerous.

I say that without being pessimistic, because the peculiarity of the situation as we see it is the combination of two things—we see the urgency, we see the danger. At the same time we see the hopefulness of the situation if only reasonable stimulus and help and guidance can be given to that great body, those millions of colored people down there, children of the tropics, right at home. We say, in other words, the nation can do just as it pleases. It can have a body of intelligent, tax-paying, industrious, thrifty citizens, or it can have God only knows what in the far future. We do believe, as a result of our 7 years' work down there, that there is a very hopeful way out, which we have actually tried, which we see being used right under our eyes. Take simply our county, with 28,000 colored people and only 4,000 white. Suppose you ask, Are the colored people going up or down? I can not tell you, and for this reason: I can tell you of individuals who are going up and I can tell you of individuals who are going down, but when it comes to the proportions going up and down, I can not answer the question. I wish I could bring it home to you our feeling that the time has come when we should be assisted by the nation in getting at the facts concerning the negro. Our situation is simply typical. In some way the nation should undertake to assist in the inquiries. We have, so to speak, a sociological catechism for our county which we have worked out. We have a book of landowners among the colored people, all those who are buying or have bought land, and it is an encouraging book, but there is great need of a body of statistics that has not as yet been gotten.

We are speaking in a very general way, of course, when we say the situation is bad and urgent. We sometimes talk about the "Big Four" in Lowndes County. The "Big Four" to us is the farm, the home, the school, and the church. We say that the home is the foundation of the nation. We say again, you can not have a home without a property basis for it. We say again, it is not enough simply to have the individual home; you must have a neighborhood of homes, and these homes must have a community center. You must have homes where you can hear the school and church bells ring, and the school making this community center must be a school and the church must be a church. I am reporting to you from a county that is very much worse than many of the counties in the South. Farms, homes, schools, and churches are what make civilization: make Christian civilization, and American civilization. Now, what is happening to these institutions? We see a distinct danger of Africanizing. You remember Prof. N. S. Shaler pointed out some time ago that there were certain districts in the cotton belt which he said were in danger of being Africanized. That is what we see. We see what are called homes, what are called farms, what are called schools, what are called churches; but they are not. They are not homes, they are not farms, they are not schools, they are not churches. At the present moment it can not be said in any sense that they amount to much, or that in particular

the American school system exists in our county. What is the American school system? When you have no schoolhouse, and when you have no teacher, why call it a school system? If you must take a little old, tumble-down log hut, with no desks or blackboard or map or text-books, except a blue-back speller here and there, and the man who teaches can hardly count his cotton weights, and school only lasts three months a year, can you say that is an American school system? Even if exceptions for the better exist, this condition of things bears as heavily on the poor whites as on the negro. We live in the land of one-room cabins, mere crop-mortgaged cotton peasants. I will not go into details about the homes. Probably they are sufficiently familiar to you. We simply have the worst probably that there is in the way of one-room cabin living. What is the matter? The two questions you have asked, your topical plan of inquiry in regard to labor, "sufficiency of public-school facilities," No. 22, and No. 23, "adaptation of public-school curriculum to the needs of agricultural people," come very close to what is the matter. These questions seem to us of startling consequence for the agricultural regions of the country in general, with heavy additional weight for the black belt, because we see no way out for the colored people of the South except through agricultural education.

Agricultural education, combined with "small holdings" of land, is to us the way to get from under the crop-mortgage system. Can we get from under it? Well, we actually see individuals coming out from under it. They are raising their food and buying land, and this largely because of the stimulus that comes from having a school in their midst, giving agricultural instruction and training. You all know where the negro was at the time of his emancipation. He was literally in the air. That is where the nation left him. He had not a square foot of ground. He was hungry. He had no loaf of bread. He had no land to get it out of. If he had had the land he had no plow, and if he had had the plow he had no mule to pull the plow, and if he had broken up the ground he had no seed to put in it, and if he could have gotten his crop started he had no hoe to cultivate it with, and if he had been able to cultivate it he had no basket or bag to pick the cotton bolls into. He had a shirt to his back, and probably an old pair of plow shoes. However, in spite of all this, we regard the crop-mortgage system as a step up. It meant a beginning of free contract. Free contract meant that these men had found, as they say down there, "a man to go on." That is how they have been going ever since, getting an "advance," and giving the year's crop as security; eating their cotton before they pick it; living under a credit-price system out of the store, getting their food over the counter, then finding at the end of every year they have eaten up all they have earned, and that a small or large balance is against them.

Within the last three months (you know we have had two of the severest seasons the South has ever known) one noticeable thing has happened. The negroes who are buying land, although they are having a very hard time, are not discouraged. Of those that are not buying land, many get discouraged, and the small white farmers or renters are getting discouraged also, and some of them are leaving their farms and going onto the railroads and into the cities.

To come back to the question of the general condition, and what agricultural labor has to say about it, we offer our farm village as an object lesson, for what it is worth. It is not enough, we are sure, to teach the individual, or to secure an individual home and farm, but there must be a neighborhood of farms and homes grouped about a civilizing center, school and church, etc. There is such a neighborhood in Lowndes County, endeavoring to lessen the difficulties of the farmer's life, to overcome its poverty and its isolation. We believe in the sort of education that will give a property basis to the negro's manhood, and enable him to make something of himself. Our hope is to plant these neighborhoods and stimulate the growth of them in our county: give an object lesson, and let it work as far as it will. We look to the farm village in particular to protect the life of the child. This goes to the root of matters, for the child is going to drift into crime unless something is done. In our county at present things are going pleasantly so far as the race question is concerned. One reason why I speak as I do is because white and colored people are working together at Calhoun. Mr. Cheanutt, a Southern white man sold one of his plantations to us. Now he is supervising the buying of the colored people, and is practically the agent of the school, working with us. He believes land owning is the way out for both races in Lowndes County. Only a very short time before Calhoun was founded there was a race war in our county. That means there was actual organized fighting, and a very considerable fight it was. It grew out of an exceptionally aggravating case of arrest. Lowndes County has had its full share of lynching, and one or two summers ago we had an aggravated case which caused a lynching not very far from us, and some of the men—not all of them by any means, but some of the men—who had taken

part in that race war, came to Calhoun's colored farmer, John W. Lemon, a graduate of Hampton, and said: "You lead us, we are ready." And what did he say to them. There was his opportunity. He got those men together and said: Now just look at the situation, and see what it means. What was the situation? Well, a woman, the wife of a colored man, had been ordered out into the field; she claimed she was sick; the husband then said to the man who ordered her out that she should not go; that she was sick. The white man went for his shotgun. When he came back the black man was ready with his gun, and shot the white man first. Then finally came the lynching. The black man was hung up and riddled with shot. "What," now said Mr. Lemon, "is the real trouble? Is it not the crop-mortgage system, and the control of the labor of your wife? On the 1st of January you mortgage not only your labor but the labor of your wife, and the man has a right to the labor of that wife in this case. Is it not better to get down to the root of the trouble; to get land and homes, instead of fighting and setting all things back? Are we not to go out from under that system, so you can say whether your wife should go to the field or not?" I mention this as a typical case. We want to promote kindly race feelings. This story hints at what is actually taking place around us. It can not be thrown into statistical form, but I think it was worth while, really, to send the group of people to Lowndes County—the eighteen people, black and white, educated blacks and whites working together in an agricultural settlement; worth while for our farm village to help stave off the possible race war that might spring up in our county.

We find the one thing that enables the black man to pull himself together and do something, is to give him the motive and the ambition which the white man requires both North and South; the chance to get a home. The other day, before I left the South, I visited and held a meeting on the Chesnutt plantation, and on the La Grande plantation. The farmers and their wives were present. We asked a carefully prepared series of questions, for instance, in regard to their farms: How far are you along in breaking up your land? How much new land have you taken in? How much cotton are you planting? How much food are you planning for? What is your advance going to be this year? Here is the point: We found these men were not only very hard at work; they had not only broken up the old land in good season, but were taking in new land; they not only were planning to be sure of plenty of cotton, but they were planning for food as never before. And, furthermore, they were all seeing how low they could bring down the advance. They were seeing the meaning of thrift; that, no matter if they raise three times as much cotton as now, unless they raise their food and unless they learn how to save, there is no way out.

Q. (By Mr. SMYTH.) You mean by advance, the advance of these men who will rent these lands; the merchant and the landlord?—A. Many of the men who are buying land have to get an advance, and they get it from Mr. Chesnutt, or through him.

Q. Is the party who advances land to the tenants the landowner or the merchant?—A. We have both cases. We have some absentee landowners, and merchants who are also landowners. The largest landowner near us is both a merchant and a landowner.

The problem with the negro farmers is to learn how to raise their food and how to save. This is admitted to be the leading question of prosperity in the agricultural South—diversification of crops and raising of food, and the habit of thrift; breaking, in short, with mere cotton raising. Now, these colored farmers on the Chesnutt and La Grande plantations we found were learning to save, and actually thinking of food raising as a part of this. In a Review article which appeared a little while ago there was a statement to the effect that the colored man was a failure as a farmer, saying also that he was a failure largely because slavery had existed and produced mere black muscle. Slavery did not produce the brain essential to our modern farmer. In a way this is only too true. But it seems to me that to realize this fact is to realize the need there is that now the nation should do something and the States should do something to teach that man to be a farmer.

We have a farmers' conference meeting each month. It is a school in farming for the older people. The economic gospel is, raise your food and buy your land. The black farmers of our farm village are now buying some 3,600 acres. Only the other day a man wanted to sell 1,000 acres adjoining one of our plantations. So the opportunity to get land grows. At the same time I will say frankly there are landowners around us who probably do not altogether sympathize with the selling of land. In other words, they take it that the land buying stands in the way of the renting system. There are certain conflicting interests. The best tenants are the men who want to buy land. The point is this, however: these very men say their land is growing poorer all the time, and the people are growing poorer. This is a double fact. It tends to create a certain unrest and discontent. Under

its influence the boys and girls are beginning to drift to the cities. It is an easy thing to get to the railroad, and you can play the tramp on a freight car until you get to Washington or Philadelphia. So the negro can help fill the slums of the northern and western cities, to say nothing about the black city slums in the South already forming.

One word in regard to the definite proposition which I have been asked to submit to this Industrial Commission. Are you going to investigate the condition of the colored man as an agricultural laborer? I do not mean colored men in general, but the agricultural condition of the negro. Can you investigate that as a part of the general agricultural question? If so, can we in any way cooperate, and can you in any way help us? It seems to us that carefully selected small areas, thoroughly examined from this agricultural point of view, would yield results. These areas should be typical ones, selected in the different States, representing different sections of the cotton belt. I am thinking especially of cooperation with such settlements as Calhoun and with the other schools, such as Hampton, Tuskegee, etc., that are actually in the South itself. Some money would be required, but money alone would not answer the case. Expert supervision would be still more necessary, and what we should want the experts to furnish us with would be two things: in the first place, a catechism covering the limits of the inquiry to be made, and also a certain amount of testimony, taken by the expert himself on the spot, to guide and supplement the testimony taken by the various schools.

I should like in the time that is left to answer any question, rather than to go on talking in a general way.

Q. (By Mr. A. L. HARRIS.) You may state the extent of this credit system of which you speak.—A. It reaches throughout the entire agricultural region. I will say that during the last month the bitterest word almost that I ever saw written against the merchant was written for a county paper in Alabama by a poor, white farmer who represents the small, white, farming class. Any study of the condition of agricultural labor in the Black Belt should include the white renter of that region.

Q. (By Mr. SMYTH.) Does the advance lien system, as we call it in South Carolina, extend generally throughout the cotton belt?—A. Yes.

Q. (By Senator DANIEL.) What is your proposition for the relief of the people; educational?—A. Yes.

Q. Who is to furnish the money for this education?—A. The nation should help.

Q. (By Mr. SMYTH.) You mean in the way of agricultural training schools?—A. Yes; and I am thinking especially of elementary agricultural training in the common schools, such as they have to some extent in Ireland and at this day. Elementary agricultural education is given in the country districts. Many a little school-house has its plot of ground, where the staple crops of the district are cultivated by the children. Russia and Austria are doing similar things.

Q. (By Senator DANIEL.) In your observation of the colored people what do you think is the general effect of the public school upon them?—A. I am afraid it tends to unfit for the real struggle for existence; that it is only too true and perfectly natural that the men coming out of slavery think of education simply as something to save them from work, especially work with their hands. This is to a degree the tendency of the public-school system as it is to-day in the country, both North and South. As to the South in particular, and the colored boys and girls alone, I am reporting; it is not my own observation, but I am speaking of the observation of educated and friendly white men and of educated negroes, who have spoken to me about the same thing. They say that instead of lifting up work of the hands, dignifying it, the public school tends to make them think they can get through life without work, in particular without hand work.

Q. Ordinary public school education tends to divert a man from work in some cases rather than to encourage him?—A. I think it does.

Q. What do you say is the average intelligence of these ordinary country or farming people in Alabama; do they show a disposition to learn?—A. They do. We have boys who walk 8 miles a day to come to school.

Q. Do not you believe there is more intelligence in these American black people than in any other black people in a civilized country in the world?—A. I think so.

Q. Most of the intelligence they got, they got in slavery?—A. I think slavery was a school in several ways.

Q. (By Mr. A. L. HARRIS.) Please state the condition of your school?—A. We have had about 800 students on an average during the 7 years. We have 18 workers there, about one-third educated blacks from Hampton, and the rest educated whites from the North. But Calhoun's life is peculiarly a neighborhood life. We are trying to build up a neighborhood with an institutional object lesson at the center. A farm, a home, a school, a church make this object lesson.

Q. Under what control is this school?—A. It is a corporation under no denom-

national control. It is seeking in every way to work in conjunction with the State, so far as the State finds it possible to work with us.

Q. From what source do you obtain funds?—A. Voluntary contributions almost entirely.

Q. Is your farm owned by the corporation?—A. By the corporation.

Q. Does your corporation engage in buying land and selling it?—A. No; that is done by individuals.

Q. To what extent does your curriculum go in education?—A. Elementary work. We begin with the free kindergarten and go up through the grammar grades. Our students run from 5 years to 21 years. We only attempt elementary education.

Q. Have you any graduates from your school?—A. We graduate a class of 10 this year. It is a mixed school.

Q. (By Mr. SMYTH.) Not in color?—A. No; all black.

Q. (By Mr. A. L. HARRIS.) What is the condition of your graduates after they leave your school?—A. Very promising, indeed. There is only one of our graduates so far about whom we have been disappointed. But the others all promise well and are taking hold. For instance, some are buying farms. We have 4 or 5 students who are already becoming landowners. That is the ambition of all. The largest colored church in our part of the county is now taken care of by one of our graduates. He is a level-headed preacher of righteousness and of vital Christianity. Then again, during the last year our students have reached about 300 pupils in the county public schools.

Q. What is the comparison between those in your locality who are not educated and those who have gone through your schools?—A. Very marked. Of course, in a way our students are on trial still, but the energy and determination that they are showing, the industry, and the idea they have of what they want in the way of homes and farms, and of higher ways of living, is encouraging.

Q. Are they industrious after getting through?—A. They are all, so far, looking toward work, and they are trying to win a home by working and saving.

Q. Do you educate them to the proper use of the hands?—A. In the use of the hands. The manual training room has just come up as a part of our repair shop. We are teaching agriculture. Farming and domestic training figure as one-half, and the larger half in some ways. Some of them when they come to graduate say: "The book seemed to us at first the great thing. We found it to be a great thing, but now work looks just as large as a part of education."

Q. What is the disposition to go on with their education after leaving the schools?—A. Good, so far as we can see. Most important of all, they are not only trying to go on with their education but are trying to educate those around them in some way.

Q. How many of these schools have you in your State?—A. I do not know anything that is exactly like our settlement and farm village work. I would rather stick closely to our own experience in our county. I do not know enough about other schools.

Q. You have other schools in the State?—A. We are trying to establish branch schools in our own county.

Q. (By Senator DANIEL.) Is it not true there is a State manual labor school for the colored people in Alabama?—A. The Tuskegee Normal and Agricultural Institute, at Tuskegee, Ala. Its president, Mr. Booker T. Washington, is one of our trustees.

Q. Is that the only one?—A. There is one at Huntsville.

Q. (By Mr. KENNEDY.) Was it the influence of that school that started up your school or was it Hampton that led up to yours?—A. Hampton and Tuskegee together.

Q. (By Senator DANIEL.) What is the condition of agriculture down there as carried on by the white people in that county? How does that compare with your experience and observation, with those colored people?—A. The small white farmers are in the same boat with the colored farmers, so far as the crop-mortgage and the credit-price system go, and their effect on land and people.

Q. (By Mr. SMYTH.) Is the whole agricultural industry depressed?—A. It is depressed.

Q. How do you account for that?—A. That is a pretty big question, but I believe the South must have a new agriculture, and that means that she must for one thing take care of her soil, feed it, and then take her food out of it.

Q. (By Senator DANIEL.) What can you raise there besides cotton in Lowndes County?—A. Corn is a leading crop after cotton; oats rank next.

Q. Can you raise corn down there in competition with the corn that comes from the West?—A. No; I do not think so. We have not carried our experiment far enough to know.

In regard to the ideal of farming it seems to us that one thing is very desirable

and possible in the cotton belt, and that is "sufficiency farming" as a basis of family life, done with family labor. They can raise food enough. They need not compete with the West in raising corn.

Q. It would not be economy for a man to go into raising that product for putting it upon the market for sale, but for home consumption it will pay?—A. That is the point. The ideal we try to encourage is simply that of a competence in the home, so they can have enough to build and furnish a decent house to support and educate their children and have enough for a rainy day, and enough for old age. The only highly organized industry in the cotton belt is the cotton industry. There is no market yet for other things.

Q. Cotton is a cash crop?—A. It is a cash crop.

Q. How much do you raise to the acre in Lowndes County?—A. We have shown the people on our farm how you can raise a bale of cotton to the acre instead of a third of a bale of cotton, the average yield for the county.

Q. By intensive farming?—A. By intensive farming and by mainly using the cotton seed as fertilizer. When it comes to corn—our experiment last year was to show them that instead of getting 15 bushels to the acre, which is the average crop, they could just as well get 25 bushels. We believe very much in the effect in the South of the leguminous plants, beans and pease. Now that the new facts have been discovered, and we know the power of these plants to put nitrogen into the soil, we believe very strongly in the building up of the soil through that. Nature in the bottoms, of course, by her overflow, keeps certain lands up. All the rest of the land is "skinned." The moment our men begin to own a little land, a little bit of dirt as they say, they do not want that washed down and sent off into the Gulf of Mexico, and they begin to think also about feeding it. They have been taking out and putting nothing back, and now they are beginning to feed it and trying to feed themselves out of it. Our practical salvation there in agriculture is to develop just that. We must feed ourselves out of it, the land under our feet.

Q. (By Mr. A. L. HARRIS.) How many acres of cotton can 1 hand till, take care of?—A. The average farmer has about 25 acres; that means about 8 bales of cotton. They do not get that as an average; the average is a little lower.

Q. That you mean to say is the total income of your small farmer?—A. Yes, with a little corn added.

Q. What part does the landlord get of that?—A. Lands in our county rent all the way from \$2 to \$3 and \$3.50 an acre.

Q. Is it a cash rent?—A. It is both custom rent, or cotton rent, and cash rent. The cash rent is growing.

Q. How much is the custom rent on the share system?—A. The share system has largely gone out among us. It did exist at one time to some extent, and involved one-half. But it dropped to one-third, and the people went out of it.

Q. (By Mr. SMYTH.) Was it not practiced very much on the principle of one-third for the land and one-third for the man and one-third for the labor?—A. Where you furnished your own stock that would make a difference.

Q. If the landlord furnished the machinery, he got two-thirds?—A. When he did, he got two-thirds, but in our county it gave away to the renting system.

Q. (By Mr. PHILLIPS.) Do the native white people cooperate with your educational efforts there?—A. We have, among other friends, Mr. Chestnutt, already referred to, who is a very important white man for us in that county. He is not a rich man nor an educated man, but he is a fine type of a good American, intelligent and honorable. He owns considerable land, and he is working with us. It grows constantly more friendly. One of the pleasantest things down there is the fact that we get along so well with our white neighbors. From the beginning the gospel has been to the colored people there that the way out for one race in that county is the way out for both races. And one of the things that Mr. Chestnutt did that was helpful was that he emphasized that. He says, "I, as the result of my experience (he had been a renter for a great part of his life), know there is no way out for the white man as a renter. I found the way out myself by buying land. And I also believe that there is no prosperity for the white people in our county except as the colored people are built up, and there is no prosperity for the blacks except as the whites are built up." That sentiment is growing.

State of Massachusetts, County of Suffolk:

I swear that the statements made by me of my own knowledge in the foregoing report of my testimony before the Industrial Commission are true, and that all other statements I believe to be true.

PITT DILLINGHAM

Sworn and subscribed before me this 16th day of November, 1899.

[Notarial seal.]

JOHN D. BRYANT, Notary Public.

WASHINGTON, D. C., May 4, 1899.

TESTIMONY OF MR. LE GRAND POWERS,*Chief Division of Agriculture, U. S. Census.*

The commission met at 10.55 a. m., Vice-Chairman Phillips presiding. Mr. Le Grand Powers, of Minneapolis, Minn., appeared and testified as follows (the topical plan of inquiry on agriculture being followed):

Q. (By Mr. A. L. HARRIS.) You may state your full name.—A. Le Grand Powers.

Q. And your residence?—A. My legal residence is Minneapolis, Minn.; at present I am stopping here.

Q. State your occupation or business.—A. For the last eight years I was commissioner of labor of Minnesota; at the present time I am one of the five chief statisticians of the Census, having charge of agriculture.

Q. Is this the first time that you have been connected with the Census Department?—A. Yes.

Q. During the time you were labor statistician of Minnesota did you give much of your time to the subject of statistics regarding agriculture?—A. I gave a large part of the statistical work of the department to that subject. In Minnesota the bureau of labor, unlike that of some of the States, has two functions—the enforcement of laws and also the collection of statistics. So far as the statistical work was concerned I gave a large share to agriculture.

Q. Did that take you over the field of agriculture?—A. Certain parts of it; not the whole field.

Q. You may state whether there has been an increase or decrease in the number employed in agricultural labor in your State in the last 50 years.—A. Minnesota was just beginning to be settled 50 years ago. I think possibly that under this subdivision of the plan of inquiry I might make a general statement, with your permission. I would say, in speaking more directly to the first two topics, "1. Increase or decrease in number employed in agricultural labor in the several States during the past 50 years." "2. Comparative condition of those so engaged;" that in the United States, as a whole, in 50 years the agricultural population has a little more than doubled. From 1850 to 1890 the population engaged in agriculture increased from substantially thirteen millions and a half to twenty-seven millions, and the following changes took place among the farm families: The farm owners, who in 1850 constituted a little over 50 per cent of the farm families, increased until they became a little over 60 per cent; the other sections of the farm population that in 1850 were slaves, wage laborers, and tenants had decreased from about 48 or 49 to substantially 40 per cent of the total number of farm families. To the extent represented by these figures the ownership of farms had increased and the dependent forms of farm labor had decreased. Of these dependent forms, tenancy had increased very markedly and the other two had decreased to a very great extent. The slaves had vanished. They represented in 1850 about 19 per cent of the farm families, giving them the same number to a family that was the average of the whites. The wage laborers that in 1850 constituted somewhere in the neighborhood of 16 per cent of the farm families had been increased by the emancipation of the slaves, but although thus increased, at the end of 40 years, in 1890, the relative number of families engaged, for wages—that is, the head of the family engaged for wages—had so decreased that it was less than either one of those classes in 1850. The tenants represent, as a whole, an improvement above the condition of the farm laborers, from which they have risen. There is possibly an exception to be made to this statement. Some of the negro farm tenants in the South doubtless represent a lower industrial level than the average farm-laboring family—farm-wage family—of the North. As showing further what that increase of farm ownership has been, I will state it in another way which will more fully exhibit the improvement which has taken place among the farm families, so far as it relates to tenure. In the history of the United States down to 1850 there had been settled on the farms a total population of thirteen and a half millions, and of the families in that population substantially one-half were farm owners. The next 40 years saw another thirteen millions and a half added to the American population, or the same as from the settlement at Jamestown down to 1850; and out of that second thirteen millions and a half five out of every six families added were those of farm owners.

Q. (By Representative GARDNER.) That improvement was not due to the improvement of conditions of those engaged in agriculture, but rather to immigration and the taking up of public lands in the West under the homestead act?—A. The first 150 years of this country had seen immigration from Europe just the

same as the last 40 years; but while during that first immigration only a small portion of the farmers were able to become farm owners, the second one did see a large proportion of them rise to ownership. Of course, the more liberal land laws assisted these people who came here to rise. They had never been farm owners in Europe. They were there wage laborers. We are now, as I understand it, discussing whether the conditions on the farm have improved. They have improved. It matters not why they have improved, or how they have improved, providing there has been that improvement. I will agree with you that one of the causes for that improvement has been our improved land laws, which give the owner, which give the slave, which give the farm laborer a chance to rise which he never had at any time before 1850. As showing further this improved condition, I will mention the fact that on the frontier to-day, even in the semiarid regions of the West, there is a greater percentage of the people who try to make homes who succeed than in central New York at the beginning of this century. In the early settlement of central New York a great body of the land was taken up under contract. Not one-fourth of the men who thus took up land and made clearings ever perfected title to the same. Further, the chances of a man who is in debt paying off that debt on a Western farm are at least ten times what they were in central New York at the beginning of this century.

Speaking of 3, the effect of improved machinery on labor, I would say that the introduction of improved machinery, in my opinion, has been an important factor in the elevation of labor. It has called, first, for greater intelligence on the part of the workingman on the farm; it has stimulated that, and it has otherwise improved the intellectual status of the American farmer. It has thus been one of the great factors in this general upward movement which we have alluded to. It is a greater factor for good even than the land laws, however valuable they may be.

Q. (By Representative LIVINGSTON.) Is improved machinery general throughout the United States upon farms, or is it local?—A. It is more fully employed, I think, in the central West than in any other part of the country.

Q. Is it to any extent in the South?—A. I think it is not in the South, and I think that the fact that the Southern labor has not ever used that machinery is one of the factors that have left that section to one side of the progress that has come to the North.

Q. Why is it not used in the South?—A. I should say it is largely because the help, the negro, is neither industrially trained nor educated in the knowledge of books.

Q. To express it flatly, you mean to say that the labor in the South is not fit to use improved machinery?—A. I do not think it has been educated up to its use.

Q. You know nothing about practical agriculture in the South?—A. Nothing, in one sense of the word. My impressions I have given you, and they are nothing more than impressions, concerning the South.

Q. (By Mr. NORTH.) Do you mean to imply that agricultural machinery, which is used in the West generally, is not used in the South in similar kinds of agriculture?—A. I think that quite possibly in the same lines of agriculture it may be used, but not to so large an extent. For example, corn raising in the South is more limited than in the North, and for this reason machinery, I take it, does not become so great a factor as it is in our Western States in corn raising.

Q. Is it economically possible to use this machinery on small plantations?—A. Not all of it.

Q. Is not that the true answer to Colonel Livingston's question?—A. That fact in part explains this difference.

Q. (By Representative GARDNER.) Are the farms in the South as large as they are in the North, outside of the great grain-raising country?—A. They are; but I understand that many of the original large plantations are now divided up into a great many small ones. The South used to have more large plantations than the North.

Q. (By Representative LIVINGSTON.) Is it not true we have by 50 per cent the largest plantations in the South?—A. I think you have.

Q. (By Mr. FARQUHAR.) In the production of cereals in the South, how many bushels do they raise compared with the great Northwest, where this machinery is used?—A. As a whole they raise much smaller crops than in the Northwest.

Q. Can you give any comparison?—A. I can not.

Q. Under the present Southern cultivation, is there any need for labor-saving machinery?—A. I would not say no need; there has been none introduced; I should say there was need of it.

Q. (By Representative LIVINGSTON.) Is it true that there are a great number of Southern plantations better fitted for machinery than anything you have outside of your prairies?—A. I think there are.

Q. Why don't they use it?—A. I should lay it to the help more than anything.

Our machinery is the creation of the thought and labor of many. It is the result of the work of countless farmers, who are the real inventors; and until you have educated all the people to a knowledge of mechanical science, practical and theoretical, so that they can grasp the elements of the problem, they are not in shape in any given section, either to introduce, or devise, or improve, or adjust to their locality the highest grade of improved machinery. That is true of any art. And if the Southern negro is the equal of the Western farm owner, with whom is the center of the invention or introduction of this machinery, then there is a misunderstanding on my part. I think that he is not. Whatever his good qualities or his bad qualities in this inventive quality, he is not the equal of the men who stand close to the soil in the same relation in the North; and here is one reason why there has not been the introduction and application of machinery to the great staples of the South as there has to those of the North. I do not say that machinery can not be applied to the staples of the South. I believe that it can and will ultimately be so applied, but it will be only when the average Southern negro workman has attained to a mechanical education equal to that now possessed by the white machine-using farmer of the Northwest. When the cotton grower of the South has the same grade of intelligence and knowledge of mechanical principles as the wheat raiser of the North, you will have the same progress in machinery, and with that the same larger general advancement. The question is one of race fitness, educational, and industrial as well as book knowledge. Industrial education cuts a larger figure than any other. I here refer to that form of industrial education for which Booker Washington is agitating.

As to causes of irregularity of employment: The greatest irregularity of employment in the North, particularly in the Northwest, is found where the farmers are engaged in raising one or two staple crops to the neglect or exclusion of any wide system of diversified industry. They are engaged in the busy season in cultivating these staples; when that is over many become idle. There was of that irregularity far more in the early days of the West than there is to-day, because the great central States of the North, where over half of our products are raised, are tending naturally and inevitably, though slowly, toward a diversity of crops that keeps the men engaged on the farms for a greater relative proportion of the year; and thus irregularity of employment, owing to this change, is decreasing.

Speaking to 5, the transient labor in poor seasons, I will say that this is, for the reasons above given, decreasing. The average number of days employed in the year, I would say, is steadily increasing wherever the farmers are developing a wide system of diversified farming.

The tendency of agricultural labor to seek other employment has many factors. Sometimes when we educate boys we educate them just enough to take them away from the farms. Our so-called agricultural colleges sometimes educate them in wrong lines. I think that is true of half of our agricultural schools. I am glad to say that in the Minnesota Agricultural College they are educating the men to stay home. When they leave the school they are educated to a love of farming; they go back and become important factors for the elevation of the farmers. They aid in spreading abroad a knowledge of the science of agriculture, the elements of success. Thus the sections to which they go become doubly imbued with this spirit of improvement and progress. Judging from the result of this school work in Minnesota, I think that so far as the tendency in agriculture to seek other employment needs a remedy it will be found in a wider education of the farming people in the science and practice of the highest agriculture. We need on the farm a wider knowledge of the factors of business success. It is not true that any fool can make a success of farming under any and every condition. The widest success in farming is found only where there is intelligence, foresight, and energy. These are the elements that make success anywhere. As the farmers are educated in all these virtues and comprehend that the farm does give an opportunity for their exercise, any undue movement to the cities will be checked and held in abeyance.

Crop sharing is the old method of tenancy as a rule in the Northern States. It is the most satisfactory method of tenancy where the tenant has only a small amount of capital. There is, however, a tendency at the present time, where the tenants are improving in general status, for them to assume the risk and pay a cash rental. When our farms were worth but very little, the land and the capital invested were small, and almost any man could become a tenant. To-day, in sections where farm lands are valuable and the capital invested is large, it takes a man of some wealth and some capital to become a cash tenant; and the most desirable tenants are those with that capital, and they prefer, as they have business sense, to take a cash rental instead of the older, primitive, and lower form of a share of the proceeds.

Q. (By Representative GARDNER.) What is the general basis throughout the country of rental by crop sharing?—A. Where a tenant furnishes the implements and machinery and live stock, he usually receives one-half of the product. If the man who owns the farm furnishes all the stock, implements, and seed, the tenant only has one-third. In the latter case the tenant is a man who has no capital and simply puts in his labor. He receives a small return. It is otherwise where the tenant puts in the capital and seed and has his implements, horses, and tools, and part of the stock. He receives a larger share of the product.

Q. (By Mr. A. L. HARRIS.) Is the tendency to tenancy increasing in this country?—A. That depends upon what form of tenancy you refer to. The tenancy that involves large holding of land by capitalists of great wealth and a permanent tenant class practically never existed in this country except in New York and some other parts of the East. That form of tenancy came to an end in 1846 by the adoption of the constitution of New York in that year. Up to that time there was a large permanent tenant class. Farms were leased for long periods of time, 100 years, 3 generations. Tenants could not become farm owners. The system bred discontent, and in 1846 the question of farm tenancy became an issue in politics and defeated Silas Wright for governor and elected Young. A new constitution was adopted in New York also in 1846. That forbade leasing farm lands for more than 12 years. That was the beginning of the end of the permanent, fixed, tenant class in New York.

Q. (By Mr. NORTH.) Was that the barn burning period?—A. Yes; and Delaware County was declared by Governor Wright in a state of insurrection during the period. In certain parts of Illinois and some other sections of our country there are a few large tracts of land operated by tenants who never have a chance to buy the land they till. The land is owned by capitalists, who will not sell the same. Those places are, however, few in number. Tenancy, except in these few isolated places, is a step toward farm ownership. Many men are able, in the course of a lifetime, to accumulate enough money to own a farm free and clear. They seek in their old age to retire from farming. They surrender their farms to some one first as a tenant. That is very frequently their son or daughter or son-in-law or some relative, and very frequently it is a hired man who has been with them a series of years and whom they trust. That man takes charge of the farm, is a tenant for a while, and then ultimately becomes the owner. That phase of tenancy is larger than it used to be, and is increasing in every portion of the country. It is more markedly increasing in the West, because originally the farmers there were all young men. Land was cheap and all were owners. But when those first settlers become old, land rises in value and all is settled, and it becomes necessary for the young man who wishes to rise in the world to begin life as a tenant. But the drift of that tenancy is upward. This you will find by noting the average age of the owners and tenants. In the census volume on Farms and Homes it is found that the farm families whose head or chief members were under 25 years of age are very largely tenants; of those over 45 years of age nine-tenths are owners. If you include men unmarried and married, owners, tenants, and wage laborers, you will find that the males only 25 years of age who are owners make up but 3 per cent of the total agricultural workers, while as you go down in life that per cent rises until it becomes very great. The average young man works as a farm laborer on his father's farm or somebody's else farm; his father dies; he may succeed his father on the farm; if he does not, he may start on some other farm as a tenant, and if he succeeds he may buy the same; and it is becoming more and more common for him to start as a farm laborer.

Q. (By Representative LIVINGSTON.) Under the share system what protection has the landowner as to the saving and caring for his farm land?—A. The character of the tenant.

Q. It depends entirely upon the character of the tenant?—A. Yes.

Q. If a farmer looks after some other business and leaves the land in the hands of the crop sharer, does the land as a rule deteriorate?—A. If he is some relative to the man who looks after the land, its quality may be held up. If he is a stranger, it has about an even chance to deteriorate. About 25 or 30 years ago there was a tendency on the part of rich farmers to buy up adjoining farms and then lease them out to tenants, and in doing that they had to take all sorts of tenants. Their farms were so generally deteriorating that they found it to be unprofitable, and they went to selling their land; it was better for them.

Q. Would you recommend the share system for the farmers generally all over this country?—A. No. Wherever the system is introduced with a view of making a permanent tenant class, it is making a failure. There is a natural check to-day upon the growth of tenancy, except where there is a legitimate relation between the family, where the father is giving over to the son or someone whom he wants as a successor, paving the way to an owner. The share system is a detriment to

the farming interests. That is the check that exists in nature on the undue growth of the tenant system in this country.

Q. How are farm laborers cared for generally? What privileges or helps do they get besides their wages?—A. In our section the average farm hand lives with the family of the employer, in the same house, boards at the same table, and is one of them.

Q. Does the married hand board there?—A. Yes, of course; but as a rule more married men get their homes and live in them with their families.

Q. When that man lives by himself, is his house and garden furnished him free?—A. As a rule, if he works by the year or by the month. But you will note this, that the number of married men among the farm laborers is relatively a diminishing quantity. I mean to say that there are less than one-third the relative number of married men, heads of families, apart from that of their employer to-day that there was in 1850.

Q. Is the tendency of agricultural labor to seek other employment due to want of good living, as a rule?—A. Yes.

Q. Or is it the fact that they do not want to do manual labor?—A. I would state the situation a little differently. Let us see some of the facts. One man to-day on a farm out in the West raising cereals for food can produce as much wheat or corn on an average as ten men did in New England in 1850. A given number of men on the farm, as a rule, can produce as much food as twice their number could 50 years ago. Something must be done to give the extra men employment, and that extra employment comes in manufacturing, transportation, and other industries. If our agriculture had not made this improvement by which a certain number of men can raise far more food products than their fathers, there would be no possibility of supporting the life of such a great number of people as are engaged in transportation and manufacturing. Our progress on the farms in the line of increased productivity of labor renders it possible to sustain life for great numbers, and the progress of these others in turn helps the farmer. There comes a natural sort of adjustment between the life on the farm and the life in the city, and this excess drifts where it can find work.

Q. If I understand, you are willing to charge largely this tendency to seek other employment to the fact that our farmers, by using improved implements and machinery, are thereby displacing hand labor?—A. To a certain amount.

Q. Is it true that in the rural sections the poorer facilities for education, getting the newspapers, daily mail, and all those things have anything to do with this tendency to herd in the cities?—A. With some people.

Q. As a rule are farmers living from their farms as well as people of other professions and callings?—A. That would depend more upon the farmer than on the classes. I know farmers that live better than the average lawyers do.

Q. Do those engaged in farming, generally, get as good a living as those in other callings, those in transportation and manufacturing, and lawyers or politicians?—A. I will say that I would not want to live as some farmers do in some sections. Let us make a comparative statement and see how we ought to answer that question. If you speak of the uneducated farmer, the farmer without any culture of any kind, one who is only capable of doing the hardest manual work, it is unfair to compare his style of life with that of the educated mechanic in cities, because the educated mechanic represents a higher standard; but if you compare him with the uneducated week or day laborer in the city, I should say that their living is substantially the same. The man in the city gains certain things and loses certain others.

Q. Do the ordinary farmers dress as well and live as well and furnish their houses as well and pay as much to the preacher and school teacher as the other classes?—A. I should say yes, for any given section in which the farmers, say in the North, are selected, for example. I should say even in the South that the poor negro who works on the farm, representing a certain stage of natural development, will give as much to the preacher, for example, as the same man would if in the city. That I know is true in the North; and he will have as good clothes in the North, assuredly; and he will buy as good papers and as many of them.

Q. The agriculturists all over this country claim that they are not doing as well as other callings or professions?—A. I do believe that our farmers are not as well off as some city people, the men who represent a type of life above them. It is another thing when you compare them with the mechanics and laborers in the city of the same education, training, and thought—the ability to enjoy and use. You will find in the older sections of Minnesota as many pianos among the farmers as you will among the same grade of mechanics. You will find more daily papers among the mechanics than among the farmers, owing to the question of mails. When you go on to the mere frontier, out to the new section, say the

Red River Valley or the newer counties, you will not find so many pianos and organs, fine dresses and fine wagons. Why? Because those men are beginning life, and they are doing that which the ambitious mechanic who is wise enough to forestall a little of the present to gain the future will do. They go without some of these things for the time being. I would not want to say that the farmers on the frontier in sod houses have all these things, because they do not.

There are more mortgages foreclosed in the East than in the West, three times over. I am frank to say that the question of debt is probably in certain portions of New York and New England ten times as great as in the Western and South-western States. The East is suffering very much from the competition of the West in the production of certain great staples, and that competition is bound to be felt more severely in the future than it is to-day, for the West has only begun to bring that competition to bear.

Q. What portion of farm products enters into our exports?—A. Very large, directly and indirectly. If you take agriculture in its primary and secondary stages, as meat products and flour, etc., it makes up very much the larger share; 80 or 90 per cent.

Q. How and where are the prices of our foreign exports fixed?—A. Very largely in Europe; competition of the world; the world market; wherever you may make it center.

Q. When the people who produce 90 per cent of our exports are thrown on the mercy of foreign markets to fix their prices, is it not likely that they will be skinned, especially where the question of competition in the manufacture of raw material enters largely into the whole question, and is not that one of the great troubles of the farmers of this country?—A. I would say yes and no. Now, let me illustrate where I say yes and where no. I may be wrong, but I give you my idea: The farmers in Minnesota, who raise millions of bushels and who determine the price of wheat, are not suffering as the farmers in New York, who raise but a little. The farmers in Iowa are not suffering, where they are raising great quantities of corn and beef and pork, as much as the farmer in Maine, New Hampshire, or Vermont, where they are raising a little. The man in the West, who is absolutely dominating the market, is not suffering, but the man in the East who is seeking to produce farm products in competition with the man who dominates the market.

Q. I understand you to say that the prices of our farm products are fixed in foreign markets on account of the competition of the outside world with our producers?—A. I would state that in this way: The markets of the world have their prices fixed by the competition of America. The markets of the world are dominated by the product of the American farm under its most favorable conditions.

Q. Why does not Chicago or New York fix the price of wheat to the world?—A. They do more to do it than any other section.

Q. How is it wheat is priced in Liverpool?—A. You can state the matter in many ways. The price on the farm is the price in Liverpool, in any great market, minus the price of sending it there; but the product that is raised here in this country and the conditions under which it is produced will determine the price at which it is sold over there. I am now speaking of general conditions, to which there are exceptions. Then there may be a crop failure in Europe; that is one of the factors affecting the world; it raises the world's demand, and there is a time when the world's demand affects the price in the United States; but if you take a series of years, the price of wheat in the world is determined by the price at which it can be produced in the cheapest place. That is a fundamental law in political economy.

Q. What is it that gives foreign markets the power and control over foreign products in this country?—A. They do not have that power. Foreign production and consumption unite with home production and consumption in fixing the prices of all products. That is all. For any given product of the farm or shop the highest price is found where the people buy the most and produce the least; that for wheat is Liverpool; for iron is Asia and Africa. Liverpool does not fix the price of wheat or cotton any more than Africa fixes that of iron and steel. All prices are established in one way. I will give a concrete case: Here are a thousand men working in the production of any article, as wheat or pig iron: each one of that thousand exerts a certain influence; you take one of them out and you lessen by one-thousandth the factors intervening there; you cut it down to one-half, and you have one-half. If Europe and the world represent one-half and America one-half of the producing power, then they each have one-half of the influence in the determination of the price; and they always have it; they are entitled to have it.

Q. (By Mr. KENNEDY.) Is it true that the markets of Europe, to which we send

our manufactured products, have as much influence in fixing the prices of these manufactured products as the markets to which our great cereals go have in fixing the prices of cereals?—A. I should say, relatively, yes; the same conditions apply to both manufacturers and farmers. The farmer who is so situated that he can produce large quantities of grain cheaper than the rest of the world fixes the price for the rest of the world, within certain limits; that is, he does more to fix it than any other single individual. The men who can use Minnesota iron ore, which is produced under conditions the cheapest, and can make use of modern machinery, have more to do in fixing the price of steel in the world than any other equal number of men, although even their prices and the prices of the world are determined by the number of other men who are engaged and the conditions under which they are working.

Q. (By Representative LIVINGSTON.) Have the manufacturer and the miner the same competition in foreign markets to face and meet that the farmer has?—A. With limitation. Let me see what that limitation is: In so far as our manufacturer finds a sale for his products in this country, and he is producing an article which is not produced in sufficient quantity to even quite supply the home demand, and the excess comes from the Old World, and he is protected with an item of tariff or import tax, then his price is not wholly fixed by the markets of the world. That manufacturer has a margin of advantage, temporarily or permanently.

Q. They meet the same competition, independent of the question of protection; they would have to meet it if they did not have that margin?—A. Yes.

Q. What Government protection or aid is given, either directly or indirectly, to the farmer of this country?—A. Protection in the sense of the manufacturer's protection—I know of none.

Q. Then you are willing to say they stand at odds, and the other industries have the advantage of them in that particular; that by the tariff of this country other industries are protected directly, while the farmers are not even protected indirectly?—A. In so far as our tariff system develops home markets and thus brings people into our country in these other industries, to that degree it is an indirect protection, and that indirect protection is a margin in its total and final effects, in my opinion, as great as the other. That, of course, is only my individual opinion.

Q. (By Representative GARDNER.) Does that remark apply with equal force, whether the native operator, called so, is idle or employed in manufactures? You mean, so far as it employs him?—A. In so far as it gives employment to the people in this country.

Q. (By Representative LIVINGSTON.) You admit this protection to manufacturers' products is an advantage that they have as a class, directly by the Government, over the farmer?—A. I do not admit it in that sense, because I believe that the farmer, without protection's hand, would feel this world competition under conditions very much worse than he does to-day.

Q. If the farmers' products meet the competition of the world in foreign markets, and the manufacturers' products meet the same competition in foreign markets of the world, if the Government undertakes to help one in any way ought it not to help the other, both being situated in certain cases alike.—A. Certainly.

Q. Has she done it?—A. I do not know why it has not, because the tariff cuts absolutely no figure. We have to-day, to catch certain of the voters, a nominal tariff on certain agricultural products brought here from other countries. That tariff may affect prices a little on the border, just a trifle, but in the markets of the United States, on all the farms of the United States, the prices are not affected a hair's breadth. It is the same as with the tariff on steel rails. Nominally you have protected the manufacturer of steel rails and steel billets; absolutely the tariff is of as little consequence to-day, when your steel rails and steel billets and bridge timbers and locomotives go to the Soudan, as your tariff upon farm products in Georgia.

Q. Are you aware of the fact that the farmers have been hammering at the doors of our national legislature for an export duty to meet this trouble?—A. I understand that is true.

Q. They say they ought to have an export duty on their products so as to balance against the odds the Government has placed them in; what do you say about it?—A. I do not believe in it.

Q. You do not think that would remedy it?—A. No; you would have out of such a bounty no benefit at all to the farmer. It would be the same as in Germany in the matter of the sugar bounty. The English farmer, as the result of the German bounty, is able to feed his hogs raw German sugar as one of the cheapest articles he can give them; and he does that at the expense of the German taxpayer. The system of bounties in Germany has simply raised the price of sugar

to the consumer in Germany, and thus lessens the amount that is consumed in Germany. If Germany would take away all bounties on sugar the common people then could and would consume more sugar, and they would thus make a market for as much sugar of their own in twenty years as they have built up by their export duties.

Q. If this country would take off import duties on sugar, would not the mass of the people use more sugar and get it cheaper?—A. Yes.

Q. (By Mr. KENNEDY.) Is it a fact that the export duty on sugar in Germany has influenced the building up of that industry in Germany?—A. What Germany has done by fostering its technical schools, what it has done in the scientific development of the principles underlying the sugar industry, has been the great factor. I do not believe the bounty has played as great a part as that scientific study that has been fostered by the German Government; and here we come right to the key of many of these things, so far as legislation is concerned. The great work of Germany, a monumental work of benefit to the German farmers, is found in its agricultural schools and experiment stations; it was the bringing out of all the possibilities of the soil in different sections. Germany has led the world in these things. And Germany has favored the farmers and has helped the farmers, and has benefited them infinitely more in that way than she has by her export bounty. The agricultural experiment stations of this country, which show the people what is possible out of agriculture in their States, have done most for the farmers. I think Minnesota has been one of those. The farmers were changing from an almost exclusive cultivation of wheat as a single-crop industry to a diversified system of agriculture. While this change was taking place the agricultural college and experiment station was finding out what was the system of diversified farming best suited, not to the State as a whole, but for each individual section—for we have a great State, and the system of diversified farming in southern Minnesota is not suited for the north. That work has been of great value to the farmers. I think I can say the Minnesota Agricultural College has done more along that particular line than any similar institution of the Eastern States. I go back into my own old home in New York. I tell my farmer friends there that their farming industry has been revolutionized by the West, and that if they attempt to compete with it they will be ruined. They must find a new system of crops suited to the changed situation. But the State ought to take the lead, and by liberal expenditure, wisely managed, ascertain what new agricultural industries ought to be established in their section which will give them as much profit as the farmers in the newer States. I do not think that any of our Eastern States are doing enough practical work in that line. It is a tremendous problem, requiring the greatest intelligence, in my mind, to adjust methods of agriculture in all parts of the land to the new conditions following the introduction of cheap methods of farming in the West, and cheap means of transportation from the West to the seaboard. Farming is a great industry, the greatest in the world. To adjust it to the new conditions the schoolmaster must be considered more valuable than the lawmaker, and the lawmaker only valuable as he can set in place the schoolmaster. So far as legislation is concerned this is the conclusion to which I come. And in the Eastern States—New York, my old home; I speak of it because I know it more fully—they are spending a great amount of money for agriculture, but they are not coming down in a practical tangible way to ascertain what the farmers can do that will not bring them in competition with these Western farmers, where those Western farmers are working under conditions that will make them masters of the market. I believe it is the same, to a great extent, with the farmers of the South. I have been preaching that as a hobby. If I have a hobby at all, it is that this nation, in its Congress, is not doing in that matter what it ought to do in the practical working out for the older sections of the nation the methods of agriculture, the crops that are suited to enable the farmer in those sections to meet this Western competition.

Q. (By Representative GARDNER.) You have given the main study of your life, I take it, to these problems. Would you be prepared to advise the farmers of New York as to what to do?—A. No, I would not know enough about it; and let me say that I want to avoid any pretense that I have given this the main study of my life. It has been, even in the last 8 years, only incidental to certain sociological studies. It is only incidental to what I consider my main work, the general looking after the labor interests of the State of Minnesota.

Q. (By Mr. FARQUHAR.) What is the condition of the dairy industry of the State of New York to-day compared with what it was 80 years ago?—A. Almost ruined by Western competition.

Q. Is anything done about stock farms and cattle raising in New York?—A. Not to the extent it used to be.

Q. Have you ever noticed, in the exports from the State of New York of cheese and butter, what the production of the State was in comparison to any Western State?—A. New York has a tremendous dairy interest; it has held its own, and increased somewhat its amount of goods, but the profit has vanished. That is what I thought you meant when I spoke of "ruin." I did not mean to say the dairy interest had been wiped out, because it has not.

Q. Independent of supplying the State of New York there with the dairy products, its export trade is quite large?—A. Yes.

Q. Do you think that a farmer in the State of New York, on an ordinarily good farm, a farm that has been opened for 70 or 80 or 100 years, can not make as much off his farm now as he could 40 years ago?—A. He can not make the money; and in the country where I was brought up the average price of farm land is a little less than half what it was in 1870.

Q. Under the new conditions of the farm in the State of New York, having no relation to the selling price of the farm, is not the New York farmer reaping as much from his land now as he did 20 years ago, say in 1880, when the readjustment of values was made in this country?—A. I question whether he is doing as well as 20 years ago.

Q. Considering the crops that we raised in New York 25 and 20 years ago, and the selling price of those crops, and the dairy product and the cattle raising that we have now, do you think there is more money raised off a New York farm now than was then?—A. The farmer turns off as much money, but he is expending more money in connection with his farm.

Q. I mean first profits; I know his expenses are larger.—A. If you will say first profits, I will have to say less profits; for the dairy farmer that I knew in New York 25 years ago was buying but very little feed away from his farm; to-day he is buying large quantities of shorts from the West and also more or less corn from the West. After he has bought that corn and other feed and he deducts that, together with any artificial fertilizers he may buy, the extra sums that he thus expends, deducted from the total sums received, will give him, in my opinion, a slightly smaller amount.

Q. Does the New York owner of the farm and the New York tenant of the farm live as well now as they did 15 years ago?—A. Live better.

Q. (By Representative GARDNER.) You spoke of tenant farmers of 20 years of age and under. I do not understand that. There is not a State in the Union in which a boy can make a contract to become a farmer under 21.—A. That is true, but there are a great many cases where a father dies and leaves an estate to his widow and a young son manages it. You will find a great many cases where a boy reports himself as managing the farm even though he is under 21.

Q. He is not a tenant farmer?—A. He is put down in this census as managing the farm. On the family schedule he puts himself as the head of the family.

Q. Tenants under 21 are usually boys who are agents for their mothers?—A. Yes, under 21. But if I made a statement about farmers under 21 I misspoke myself; I should have said under 25.

Q. I understand the inference from your statement to be this simply, that the only tenant who will keep the farm in condition is the one who anticipates becoming the owner?—A. Probably, yes.

Q. You stated there were fewer married men now on farms than formerly; I believe no one asked you the reason for that.—A. I used the words "married men" to represent a family, where the head of the family was a married man or any way supported as the head of the family; for example, we had formerly a great many families, father and sons, who worked for wages on farms and died working for wages. To-day the average man when he starts in life has a chance of dying something besides a wage earner. I speak of the married man, not meaning anything of marriage but simply to represent the unit that we call in life a home and family. The number of families the head of which is a married man was what I was speaking of; those are decreasing where they work for wages.

Q. To what do you attribute the decrease in the number of the men who come under that classification of married men from farm laborers, or is that covered by your statement that they find better employment?—A. Let us put it in another way. There is a certain number of people leaving the farm owing to this cause already referred to. There is just the same chance for the man who is owner to leave the farm and make something as there is for the laborer. In this exodus from the farm to the town there will be a larger proportion of farm owners than of farm laborers. They all have a little money and are in better shape to avail themselves of the opportunities of the city. Notwithstanding this fact the natural action and interaction of the forces on the farms in this country is such that the

owners and tenants increase, the number of the laborers decreases, and the wages of the laborers increase. There is on our farms a greater opportunity for men to rise than there ever was. The movement to the city is no new thing. That movement has been going on for centuries, and will continue to go on. It is the salvation of the cities. Note the men who 50 or 60 years ago thus left the farm. They are such men as our great jurist, Justice Field, and his brother Henry, and multitudes like them—all farmers' sons. They go to the city and make the backbone of our republic. They come out of the farm-owning class rather than the laboring class.

Q. (By Representative LIVINGSTON.) Is it not true that the bankers, lawyers, doctors, the leading men in all pursuits, in every city in the United States, were originally farmers?—A. Very largely so.

Q. (By Mr. RATCHFORD.) We have, as I understand, among the farm laborers two classes, one the heads of homes and one which is not?—A. Yes.

Q. I understand from your statement that that part of the farm laborers known as the heads of families is decreasing in number?—A. Yes.

Q. And the question asked by Mr. Gardner is, Why is that class decreasing in number as compared to the class not the heads of families?—A. I did not catch that. I see the point. The great mass of our unmarried farm laborers are young people. They are the sons of farm owners, of farm tenants, and also the children of laboring farm families, and a very great proportion are under 25 years of age. As I mentioned before, the average man does not marry until 22, 23, or 24. If you should take 25 you would find that the average man under 25 is an unmarried man. The young man starts in life on the farm as a laborer and he becomes something else. One-half of them, when they get married, will work out with their wives and board in their employers' families. I recall a farmer in New York who came over here from England at about 17 years of age and worked until he was about 24 years of age as a farm laborer. His wife came from another section of the Old World. She worked as a servant on a farm until they were married; then they worked 2 or 3 years as man and wife on a farm, and finally took a farm as tenant, and later purchased a farm, and by the time he was 40 years old he had paid for a farm worth \$5,000.

Q. (By Representative GARDNER.) Are these young unmarried men on the Western farms the men who work the agricultural machinery that the laborers in other sections lack the education to work?—A. The great mass of our farm laborers, so called, are the children of the very men for whom they are working.

Q. They get the mechanical education necessary for the operation of that machinery on the farm?—A. On the farm.

Q. (By Representative LIVINGSTON.) They have no industrial education, have they, particularly?—A. Excepting as they have been taught on the farm.

Q. (Mr. A. L. HARRIS.) What is the character of the foreigners who go on the farms?—A. They have been largely men who have been employed in Europe as agricultural laborers. They have come largely from Germany, Scandinavia, and Great Britain. There have been a few from Bohemia, settling in certain portions. The agricultural immigration has been largely of the nationalities mentioned. The exact percentage of literacy is probably not far from that of the people of the North, taking the great body of this immigration that has settled on the farms. The immigration from Scandinavia has a larger percentage of people who can read and write their language than probably the native population, all told, of almost any State in the Union. They can all read and write. The German immigration proper is a little short of that, and then when you pass from German to Bohemian it is quite a little less. Of the literacy of the French Canadian who has come into some portions of the West as well as in New England I can not speak, but the general intelligence of all has been such as to elevate rather than depress the general tendency of our Western and Northern agriculture.

Q. (By Mr. NORTH.) The immigrants who go on the farms are the best that come to this country?—A. I should say they are very largely the best. Many Irish have gone onto the farms, the best educated among the Irish. The Irish represent of these three great types the least degree of average education when they come to the country.

Q. (By Mr. KENNEDY.) Is it not true that the best educated of the Irish come from the cities, like Dublin?—A. I can not say how that is. There is a certain ignorant class that drifts into the cities here.

Q. (By Representative GARDNER.) Is it not your impression that your statement that the educated, better Irish go to the country ought to be emphasized?—A. When I met the Irish in the country, as I did in my boyhood days in New York, I always looked upon them as the most desirable people. When I met certain other types which I saw in the cities around low saloons, I never fell in love with

them. I never saw any of that drinking element on the farms of New York where I was raised.

Q. I meant more particularly the latter period.—A. Well, I think it would be wise to emphasize the fact that the more educated foreign population drift to the farm until you come above a certain level, where they come to the city again.

Q. (By Mr. NORTH.) Is it a fact that the immigrants who go onto the Western farms come from European farms or from European cities?—A. I think they were very largely farmers at home, so far as my knowledge goes. I do not recollect a single man on a farm that I ever met that came from the city onto the farm. I have found people who settled in these cities that came from the farms, but I have not found any in the country that came from the city. Of course there is no question but that there are some.

Q. (By Mr. FARQUHAR.) Do these foreigners settle in colonies in that part of the West?—A. We have both, colonies and scattered.

Q. In the case of the use of foreign languages, do they still maintain the foreign language in the colony?—A. The Germans do, especially when they are settled under some semireligious auspices. The Scandinavians everywhere seek to put their language behind them.

Q. Is all public education in the State of Minnesota in the English language?—A. Yes—no. Everything is in the hands of the local authorities. When I say yes and no, both of them would apply to some of these colonies. You may find some of these colonies where a portion of the day is devoted to the teaching of the old language. You will not find that among Scandinavians in the public schools, but you will find some Germans where they will insist upon devoting a part of the day to a study of the German language.

Q. Have you free text-books?—A. We have a free text-book law, but the application of that law is left optional with the various districts. It has been adopted in a little more than half the State. I may mention in passing, that by the adoption of that law, the superintendent of public instruction figures that there has been a material advance in the average attendance per year of the several pupils.

Q. (By Mr. A. L. HARRIS.) What effect, if any, does immigration have upon American agriculture; that is, whether it is for the better or worse?—A. I would not want to express a very decided opinion. The examination that I made in Minnesota, relating to the average progress that had been made by several elements, American born and foreign born, so far as it goes to show anything, would indicate that the American-born farmer is able, on the farms of Minnesota, to make a slightly greater amount of progress than is the foreign born. It takes some time for a man to adapt himself to the changed conditions under which he must work to make success, as agriculture is different in this country from what it is in Europe, and if a man from Europe could come here, where we know the conditions are different, and make the same progress, it would argue very much against our American population, but the data which are found in my report, summarized, show the American makes some slightly greater progress in the accumulation of money, although the popular idea is to the contrary.

Q. (By Mr. KENNEDY.) Did the people of northern Europe who settled in most communities of the Northwest become producers there before there was a demand in the market for the surplus products?—A. Both the foreign immigrants and the native people moved to the West in recent years and in the past time before there were markets. The first great motive that existed in the past and exists to-day, causing the immigrants to move, is that of obtaining a home. Our fathers went into New England to get a home primarily, and not to sell on the market. Our fathers moved from New England out into the great West, and the man who comes here from Europe comes primarily impelled by the same motive, to get a home, and that, it must be remembered, is the ruling motive rather than that of markets. The people have made homes ahead of markets. But the creation of markets has given a tremendous stimulus to this immigration movement. This is true in the new Northwest, and I presume it is the same in the great Southwest, in Texas. The families going into Illinois years ago had a long hard siege getting their homes, simply because there were no markets. They got their homes, but their living was very primitive, because they were getting a home. Now the whole thing has been revolutionized by the building of our railroads and other transportation facilities ahead of the population; men now get homes mainly where there are markets provided by these railroads. Immigration is there moving along somewhat different lines from what it once did, but we must remember that from the first settlement of the country the acquisition of a home and not the market has been the primary impelling force.

Q. Then you believe that their overproduction and their surplus products have not brought any real injuries to the communities of the Central West and of the East?—A. The amount of their products is the determining factor in fixing prices,

and with cheap transportation those products have unfavorably affected the farmers in the East. I have no question about it.

Q. (By Representative GARDNER.) If the first white man had not yet crossed the Mississippi, and our population was massed east of it, the probabilities are we could pay double?—A. I wouldn't want to state it in that way. In 1870-1874 I was in Iowa, at the beginning of the agitation of these farm questions. At that time it cost from 1 to 2 bushels of wheat, according to the price in any given year, to take 1 bushel to Liverpool, to the markets of the world. The farm problem was the elimination of that share of the product of the soil that went to the middleman. That share has been constantly reduced until to-day it takes only a little more than a half a bushel of wheat to take a bushel from Iowa to the Liverpool market. Now, the farmer reasoned in 1870 in this way: We want to eliminate that middleman, and we ought to have one-half of the benefit of that elimination and the man in Liverpool the other half. That was the way the farmer reasoned in 1870, and in one sense he was correct. The farmer has not found his gains, however, where he expected them. He thought that the price of wheat in Iowa would receive an advance equal to one-half of the change in the cost of transportation. It did not. The price of wheat is substantially that which it was in those days; no more, no less. The average in gold is substantially what it was in 1870-1875. It would not do to take any one year to make that price; but, taking that producing section as a whole, the price is substantially what it was then. So far as the price of wheat is concerned, the Western farmer has gained nothing by the elimination of the middleman. His gain is found elsewhere. It is found in the decreased cost of the goods which he purchased. The purchaser of any article will always get the benefit of any changes in its manufacture, transportation, or handling. The producer absolutely never gets any of it. That is true of manufacturing and it is true of agriculture. The farmer in the far West receives this old price for his wheat, and buys all his purchases at reduced prices. This latter gain is very great. In this way he receives his share of the reduced cost of manufacture and of transportation. The extent of this gain may be noted from these facts: A reaper that was not a self-binder in 1870 cost about \$350 to \$400, the first reapers of that kind. A man now buys a self-binder that is far more effective in its relative functions for \$125. He can buy a better plow for \$12 than he could then for \$28, and so on with the rest of the machines, and so on with all other articles that he purchases.

Q. In stating the general principle to be that the reduced cost in transportation and handling always goes to the purchaser, and giving that as the reason why the farmer did not realize his expectations in the actual increase of price of wheat, are not you entirely eliminating the law of supply and demand? In other words, is it not true that just at the time that the middleman was being eliminated here, and the cost of transportation being reduced, and all that, that Russia, Argentina, and India were getting into the Liverpool market with wheat; and would not that of itself have been sufficient cause for farmers failing to realize expectations—that added competition in the market which he was reaching?—A. Yes, and no. The existence of vast wheat fields in the Northwest, with cheap transportation, if there had been no other factor, would have produced the changes noted under the law of supply and demand, even if there had been no such growth in Argentina and Russia, and the demand in Europe had remained the same as now. I mean to say that the law of supply and demand would have furnished a source of supply for all of that product in the United States without that, and keep the price where it is.

Q. (By Senator DANIEL.) Development had not taken place in one locality, but had progressed in another?—A. That is it exactly.

Q. (By Mr. NORTH.) Do you accept Mr. Atkinson's statement that the productive capacity of wheat in this country is able to meet all demands of the world for the next 50 or 100 years?—A. It depends upon how you state that proposition.

Q. Have you read those articles?—A. Yes; I have read the articles referred to. It is more or less hypothetical; and as you change the terms of every question you would have to change the answer very largely. He makes the proposition, What would be the production of wheat in the United States if you could keep the price of wheat at a dollar a bushel in Liverpool? I say the amount of wheat that would be produced at that figure in this country could hardly be calculated.

Q. It is immeasurable, what we are capable of producing?—A. It is immeasurable, and at that price it is hard to estimate what will be realized either in wheat or any other staple in this country in the next 50 years.

Q. (By Representative GARDNER.) Hypothetically, if we raised so much wheat at the expense of other crops, what would happen?—A. We would be importing lots of other things in agriculture from our semitropical neighbors.

Q. The Land Office reports that about all of the agricultural lands of the United States are taken up; that is, exhausted, as they put it. Is there any considerable amount of that land that is not reduced to cultivation?—A. There is quite a large amount of railroad lands that have never yet been settled. There are some lands still owned by some of the States, like Minnesota school lands and other lands, that have never been settled. There are in Minnesota large bodies of pine lands that will ultimately, when cleared off, be made available and make good farms.

Q. Have you an idea of the proportions of them, and the amount already cultivated?—A. I would not want to make any definite statements. I will say this in general: There is a larger amount of land that is possible for cultivation and settlement than our pessimists, the dark-viewed philosophers, can agree or can even imagine. There is less than some of our most hopeful people would think were possible in this country. I would make it between these. I would not want to attempt any definite statement.

Q. (By Mr. NORTH.) In a general way, the agricultural possibilities of the country are still very far from completely developed?—A. You are correct. In that connection I want to call attention to the possibilities of irrigation. I do not think that we have begun as a nation to wake up to the possibilities that lie before this country as the result of a proper irrigation system, and when that is considered I think there will be as large an extension in the next 25 years as in the last 25.

Q. From an economical view, do you favor these pending bills in Congress?—A. I have not studied them enough to know.

Q. (By Mr. FARQUHAR.) Do you know whether, where they have been tried in the West, they have been a great success?—A. Irrigation must be judged very largely by what has been done in other nations. Further, no great development of irrigation will take place in the far West until markets are developed for the produce, or methods are found for getting it cheaply to the markets, or crops can be raised in that section that will readily find a local market. You can not greatly extend the border of our civilization in agriculture much faster than you can develop the methods of transportation or find a local market for the products. The center for the cultivation of wheat since 1870 has moved 250 miles to the West and Northwest. That could not have been done had not the cost of transportation been such that the farmer could have a margin of profit at a point 250 miles farther away, and still get a price as large as he was getting on the whole at that other time.

Q. (By Mr. PHILLIPS.) Do you think when irrigation is obtained on a large scale that persons can get homes on these irrigated lands as they have where irrigation did not prevail, or before it came in?—A. They will have their tenure somewhat different, because that tenure will have to be subject to whatever system of irrigation is found best suited to this country. But, as I say, development of that irrigation will have to wait, not alone upon the mechanical or engineering problems of that irrigation, but also for the question of transportation. It costs too much for a poor man to make a home on that land until there is a market for his products. Up in the mountainous regions of Montana and Colorado you will now find irrigation on a small scale. The people there are raising by means of irrigation a small amount of crops, for which they find a ready market in their own States among the mine workers and the like. That crop raising by irrigation can not be extended any faster than the mining and allied industries are developed. At present there is a profit in this crop raising by irrigation in these sections. The price at which they sell their products is a price equal to the selling price of these articles in Minnesota, in Kansas, or Nebraska, plus the cost of transporting them to these mine centers. But that profit would cease if you take from that price in Montana and Colorado twice the cost of transporting the things raised from these States to Kansas City or Minneapolis, and that is what would take place if those sections changed from importing to exporting farm products. Successful and profitable agriculture by irrigation in Montana and Colorado at present is largely fixed by population there. If these States can develop a market for fruits, or anything that may be grown which will bear long transportation to the East, then you may have successful farming on a large scale there; otherwise not. That market will come in time; I believe it will come in the next 25 or 30 years.

Q. (By Mr. A. L. HARRIS.) What suggestion have you to make in regard to restrictions of immigration?—A. Nothing, excepting educational, possibly, and moral character.

Q. As to the sufficiency of public school facilities in the Northwest?—A. I think they are the best of any part of the United States.

Q. (By Mr. NORTH.) Have you compulsory education laws in Minnesota?—A. We have, but they are not very much observed; that is, the compulsory feature of it is not enforced.

Q. It is not necessary to enforce it?—A. Well, I will not say that; there is need of its enforcement in certain exceptional cases.

Q. (By Mr. A. L. HARRIS.) What have you to say in regard to the adaptation of the public school curriculum for the needs of the agricultural people?—A. I think it is improving rather than growing worse. You can always find fault with anything.

Q. Now, the question of technical education; you touched upon that this morning; have you not something further to say in regard to that?—A. The basis of technical education, so far as it relates to agriculture, must be among the farmers themselves, and it will begin by developing among the farmers, in all possible ways, a knowledge of the better methods of agriculture. I might mention what President Hill of the Great Northern does: He brings down every year from every county along his road in Minnesota, and sometimes over in Dakota, two from every township, free, to the State Agricultural School at Minneapolis. He brings them down, transportation free, to stay 8 days in the city, with the understanding that they shall spend 1 day at the Agricultural School and experiment station; and he explains that his profit and the profit of his road can alone come from the added prosperity of the farmer, and that can come only by a higher knowledge of agriculture and improved methods of farming among the farmers; and hence he has brought for several years what is equivalent to 10 train loads of people per annum a distance of from 150 to 300 miles. He says it is not philanthropy—it is business. It is the best way of adding to the profits of his road.

Q. (By Mr. NORTH.) They can not learn much in two days.—A. They get an insight. They can not learn everything in one day. A great many of these men will be interested in sending their boys and girls there. The girls go through the practical work of learning the dairying in all its improved methods. The boys are taught everything about feeding cattle and raising crops, and how to make the almighty dollar on the farm.

Q. The agricultural college is doing a great deal of work, then?—A. Yes; and that work is strengthened by other educational forces and by the action of the business men. Another educational factor in that community is the farming implement. One factor, in the cost of the old reaper when it was \$400, was the schoolmaster. With every instrument that was sold at that time had to go a man who taught the people how to use it. That man had to spend, on an average, 10 days with every farmer who bought a reaper. That man had to be a skilled mechanic, who was a high-priced workman. There were his expenses, his salary, and the interest on the money invested. These together made at least about \$100 to a first-class reaper. That was the fee which the farmers of this nation had to pay to be taught how to set up and operate a reaper. Now, when you have educated a great many farmers in this way they in turn become schoolmasters. They teach the other farmer. With every implement sold in 1870, a man had to go from the factory to set it up. There was not an implement dealer who knew how to set it up. Now all that expense is eliminated, since you have got the people educated.

Q. (By Mr. FARQUHAR.) Was not the former custom to charge the farmer with the cost of the expert mechanic and everything that went into the cost? It is another illustration of the principle that everything that is involved in the cost of an article has to be paid by the purchaser, and if you eliminate anything it goes to the man who buys it?—A. Yes; same as in wheat.

Q. (By Mr. NORTH.) Can you give the commission a general idea of the real efficiency of the existing agricultural colleges in the West?—A. I would not want to state about all of them, but I do know none of them have as large a proportion of the graduates go back to the farms as Minnesota.

Q. Do you know anything about the work of the University of Wisconsin?—A. I know they are doing a great work. I know in most of our Western centers there is a great work being done, and I am satisfied that the work of our agricultural schools, as a whole, in the Northwest is adding as much to the prosperity of the farmers as any single factor, or more than any other single factor.

Q. Do you have agricultural experimental stations connected with the college or apart from the college?—A. They are all under control of the college. Originally there was but one experimental station, and that was in connection with the agricultural school. Subsequently there have been opened, or are being opened, some three more in the State. They are located in different sections of the State and have different problems before them. There has been one located in the northern part of the State to investigate the character of farming that is best suited to the North, and upon lands once covered with pine forests. Those lands have another kind of soil from those of the South, or from the Red River Valley.

Q. Do people so far appreciate the work of these experimental stations that they willingly grant appropriations to sustain them?—A. Yes.

Q. (By Representative GARDNER.) A while ago I asked about the lands not yet reduced to agriculture. You answered that our agricultural possibilities were beyond conception, or something of that sort. You meant by that, I presume, agricultural possibilities, or something on the same basis—that is, it did not have any reference to the intensive system?—A. Yes. I do not know now what may be done on that intensive system.

Q. (By Mr. A. L. HARRIS.) Can you state as a statistician what is the amount of capital employed in agriculture at the present time, or rather in agricultural pursuits?—A. Meaning those forms of agriculture that are classed as agriculture in the census?

Q. Yes.—A. The value of the farms was a little over thirteen billions, that of the live stock and farming implements a little less than three billions, making a total of about sixteen billions.

Q. What is the comparative earnings of that capital compared with former years?—A. There is no way of stating that in percentage. I might say the only way of which I know of forming an intelligible answer to that is this: The number of men who are seeking and obtaining farms of their own is greater to-day than it ever was. This fact is evidence that there is relatively a greater profit than ever before in farming. The percentages of profits on the capital invested may, however, be actually smaller than 30 years ago, just as the rate of profit has been lessened in all other business. Money commands a far less rate of interest in all industries. The rate of net profit expressed in percentages has correspondingly been reduced in agriculture, as in manufactures and in transportation.

Q. (By Representative GARDNER.) You state that the fact that the ratio of the farm owners is increased would be evidence of the increased prosperity. Might that not be because our public-land system made the taking up and the settling of the farm the easier and most certain way of getting a home, without regard to its profits as an industry.—A. The land itself in the state in which nature leaves it is only a very small part of the value of a thoroughly good farm. The fact that these people who go onto these lands are able to improve them, erect houses and barns, and make all the other improvements with a far greater rapidity than ever before, must be taken as a measure of that added prosperity, whatever the factors producing it. The farm is, to those who understand farming, the best place to make money. To the man who does not understand farming I do not believe that the farm is the place. It takes somebody besides a fool to work and make a success on a farm.

Q. Following what you say on that, that the farm is only valuable to the farmer, that exposes the fallacy, does it not, of the contention of those who, when they find the cities overstocked, start an agitation to go on the lands and get rich?—A. It does. To send a man who knows nothing of farming onto a farm is at once to inflict a great injury upon the community and the man. It also marks the ignorance and the charlatanism of the man who advocates it. There is no way of taking such people out to the farm but by starting a school and giving them a schooling of 3 or 4 years. That is the only way of taking those people onto the farm. If at any time there is an overpopulation of the city and a deficiency in the country, a certain number of these people can be utilized as farm laborers. Some were thus sent from our Western cities during the last few years. Bureaus of intelligence were organized in these cities, and many men were sent out to the farms when employment could be found for them. Every man out of work and ready to adapt himself to anything could thus find a place. It is wise in times of depression, thus to organize society, find out where there is a deficiency of labor, and send the men there.

Q. After what age should a man not attempt to become a farmer at all; I mean in all its branches—the handling of stock, the driving of teams—at what age would you think he was too old to begin that education?—A. The same age that he ought not to take up any other trade.

Q. (By Mr. A. L. HARRIS.) What have you to say on the subject of taxation of property?—A. Our systems of taxation in most of our States—especially where there are developments of manufacturing and great transportation companies—need complete remodeling. Our old system of taxation—the system of taxation in vogue in most of the States—was developed at a time when all property was visible, the same as farms, cows, steers, or horses now are. That is no longer the case. Those visible forms of wealth make up practically only one-half of our resources, and as a result nearly if not quite a third of the property of the country is escaping taxation. To meet this condition of affairs we must change our methods and adopt the various forms of taxation suited to our day—the corporation tax, the inheritance tax, and the income tax.

Q. (By Senator DANIEL.) What do you think of a gross or net receipt tax on the corporations of the country?—A. I have not gone into a detailed study of cor-

porate life enough that I would be willing to give a definite opinion upon any given scheme of corporate taxation. I have only come to this conclusion: It is but justice at once, to the farmers and to the general community, that in some form that may be just and equitable between the several interests, these corporate and other allied forms of wealth should bear their due share of the public burdens. I simply want to put myself on record as decidedly in favor of the general proposition that justice to the farmer and the principles of equity and fair dealing which lie at the basis of all just laws demand a complete revision of the present system of taxation. We should adopt a new system, one that will recognize the world as it is, and not as we might wish it was or as our fathers found it.

Q. (By Representative LIVINGSTON.) Are you aware of the fact that the farmer, of all classes in the United States, has the least chance of escaping taxation?—A. Certainly, there is no question about that.

Q. (By Representative GARDNER.) Do you not think that any system of taxation by township or local divisions through the country would necessarily be more onerous than the taxation in cities?—A. Taxation in cities involves, in some respects, heavier expenses than are common in the country, but the people paying them have special advantages. For example, we have a great many so-called taxes in cities that are not really taxes; they are in reality investments under the name of taxes. A tax may be levied under the name of a sidewalk tax or water tax. It is levied for putting water mains in or sewers. It is an expense charged up against the abutting property. That is not a real tax. It is a form of investment. If you count these as taxes, then the city tax lists are very much larger than those of the country. I would say that a great deal depends upon the section where you are and the conditions. In New York State, where in the cities there is an aggregation of many capitalists, where the capital is actually not in the State, where the resources represented are scattered all over the country, it absolutely is true that proportionately to their wealth the city people pay only a third of that which the country people pay. And hence in New York large sums are raised in the cities to support the country schools, and this is but just.

Q. (By Mr. FARQUHAR.) Is it not shown by the tax lists, made by competent officials, the board of supervisors, that the cities of the State of New York pay usually two-thirds of all the taxes and the farming portion one-third?—A. Certainly; but proportioned to the ability of the people to pay, the country still contributes the larger share.

Q. Is it not another fact that the city populations of the State of New York contribute continuously to the country the amount of their taxation, and reap no benefit from the country that they do not pay for? Is it not in the nature of a gift?—A. I would not call it a gift, but the payment of a debt; in all those things the city only pays what it justly owes to the country.

Q. How should a city like New York or Chicago account for that portion that it is supposed to owe?—A. There are very many debts of the city to the country. There is a movement of wealth from the country to the city. Here is a man who works on a farm, and in the course of a lifetime accumulates a little money. He has the farm free and clear and a little money besides. He moves into the town. His brother moves from the little hamlet to a larger town, having accumulated a larger property. Thus there is a constant movement of property which was accumulated, made, produced, and created out of the farm into the city. Here in one sense is a robbing of the farms. Farm wealth is being exhausted as farm population transfers these resources to the city. Now, if you have a farm and you crop it and never return any manure to it, you will soon exhaust the power of getting crops from it. The same thing applies to the farm sections, from which have come all the great minds of the country. Many farmers, with their resources obtained from the land, move each year into the city. Now, if they do not give back to those sections whence they come some return for those resources, you would sooner or later pauperize and degrade them. You must maintain their ability to make money as you keep up the fertility of the farm. You must tax that money that was earned on the farm and which has been moved to the city, and give back to the farm the legitimate income out of that capital. You must expend it for country schools and roads, else you are exhausting the country for the benefit of the city. This is done too much now. We must, in the interest of the farming community, replace upon the farm that which is taken from the farm when its owner moves into the city.

Q. (By Representative GARDNER.) What comes to the city from the farm—the rent?—A. The money. Here is a man, in the first place, who makes a little money on the farm and goes into the city. John Smith who lives in one of the rural townships of one of your counties moves into the county seat. He takes into that county seat the result of his savings for a lifetime. Those savings come from that town where he was. He never goes back to that rural town. A just law should

in some way take the taxes paid by that man out of that county seat and give it back to the rural town, the farm, the farming community. In the same way taxes should flow from the larger cities into the smaller communities, because there is a movement from the smaller cities to the larger cities, just as there is from the farms to the smaller towns.

Q. (By Mr. RATCHFORD.) I understand from your statement that the farmer is sustaining very heavy losses by reason of this migration from the country districts into the city; by reason of the farmer having accumulated money, and bought city property with it and moved to that property, and hired John Smith or somebody else to go on to the farm. Now, would the farmer not suffer equally as much were the original owner to remain on it as it has suffered by his moving to the city?—A. John Smith's farm is not affected one way or the other, but the community in which John Smith's farm is is entirely a different community by reason of the fact that John Smith and all like him move. We have something besides the farm. We are not now talking about the farm because the farm is only one factor in the development of the community; the men are the greatest factor.

Q. (By Representative LIVINGSTON.) You mean the schoolhouses and churches suffer, and all the enterprises of the neighborhood?—A. Yes.

Q. (By Mr. RATCHFORD.) Is it not to be presumed that the original farmer will be supplanted by a class of men who are equally as intelligent and as frugal and industrious?—A. But not as wealthy. Here is John Smith at 60 years of age in a town we will call Preston. He is worth \$10,000. Worth that amount he can give and does give for the support of the church voluntarily \$200 a year. He can give and does give in the shape of taxation \$100. He goes away. Out of this property that he is taxed upon, there is only one-half of it in the farm; the rest of it is in some intangible form. This man who comes is only worth a thousand dollars. He can not give to that church but \$20 a year where the other one gave two hundred.

Q. (By Representative GARDNER.) Suppose that the city man should answer to that that your theory was precisely right and ought to be extended further; that inasmuch as John Smith accumulated his \$10,000 by the sale of his produce in the city to people engaged in manufacture and commerce in the city, that the city should always have taxed it because it was a primary or earlier source of the wealth, and had been drained from it before Smith got it?—A. Let us see what has been done in Paris and in certain other cities. We will there find a practical answer to the question. A great many cities originally derived their whole revenue from a tax levied upon the products coming into the city. They assumed that this was a tax which the man who sent his goods into the city always had to pay. Thus, when the gardener came in with a load of green produce, he was met at the gate and had to pay the tax; but all of that was simply paid as a tax by the residents of the city. The method of taxation did not determine who finally bore the incidence of taxation. The taxation for the support of the city did not come from the farmer, but was paid by the man upon whom its incidence fell, the man who bought those products.

Q. (By Mr. A. L. HARRIS.) What have you to say in regard to the decline in the price of agricultural products in the last, say, 30 years?—A. There has been a very large decline at points where the price is affected by the cost of transportation; there has been a less decline in points from which that transportation has carried the produce. There has been a decline, but small, in articles that have not been over-produced; there has been an enormous decline in the articles whose production has increased faster than the population. The law governing the price is that which was set forth by one of the old English economists 200 years ago. It is this: Where you double the product per capita, the price falls to one-fourth its earlier figure. That was the law that was announced in agriculture 200 years ago in England, and is substantially true to day.

Q. (By Senator DANIEL.) That law would presume the same amount of money?—A. Other things being equal. If you double the per capita demand or reduce the supply one-half, you will quadruple the price. It does not simply double the price but it quadruples the price. If you increase the quantity per capita of any agricultural products three times, you will decrease the price to one-ninth; and, on the other hand, if you cut the supply down, as it was occasionally in famines in Great Britain, to one-third, you thereby increase its price nine times, other things being the same.

Q. (By Mr. A. L. HARRIS.) That holds good in all the farm products, grains, cotton, etc.?—A. I believe that that principle in general applies to-day the same as it did 200 years ago.

Q. (By Representative LIVINGSTON.) The capacity to consume, by purchase or otherwise, has as much effect on prices of products as the question of over or under-production?—A. That comes in as a factor, slowly modifying prices. With cer-

tain articles it has far greater influence than with others. The amount of bread which a man can eat, the number of pounds of breadstuffs, including wheat, corn, oats, and all others that we use for human food varies but very little. We may change the form of it, but the number of pounds a human being eats is substantially the same. He may substitute cornmeal or oatmeal for wheat, but the number of pounds consumed will substantially be the same. The general proposition is not true to so great an extent with articles of food that may be called luxuries. The rule governing the consumption of strawberries or California pears or oranges or fruit is quite different. Their consumption may be increased enormously, and such increase may exert but a little influence in decreasing the consumption of these other things. As showing something of the power to increase consumption of food luxuries, I will mention the fact that Minneapolis, as a center of consumption and distribution of the Northwest, shows a doubling of fruit sales every 3 years for the last few years. Population has been doubling once in 15 years, but the sales of fruits double every 3, or eight times as fast as the population. A certain portion of the relief of agriculture must come from an increased consumption of these things, which represent relatively a large amount of labor. The increased demand of our people in the United States for these luxuries represents about as much for the farmer as our increased exports. Thus note canning, which represents one phase of this business. It began about 1865 or 1870. Now the amount of fruits, vegetables, fish, and meat that is consumed in cans in this country is very great. It may be stated in many ways. I sometimes put it in this form: Measured in quarts and pints they equal the total consumption of alcoholic liquors to-day. Their cost or value represents an immense sum, larger far than has been added to the drink bill of the nation in 30 years.

Q. (By Representative GARDNER.) As to the drink bill, is not there a vast amount of authority from various countries going to show that people drink in proportion to their depression or hard conditions rather than in proportion to their prosperity, or what the statistician would call ability to consume?—A. No. The drink habit, like the smoking habit, as well as all the vices of the world, increase with prosperity and decrease with adversity.

Q. (By Mr. A. L. HARRIS.) What is the cause of the decrease in the money value of land in the older States?—A. The money value of lands in the West has increased because there is a greater profit; the money value of lands in the East has decreased since 1870 because all they have been accustomed to produce in the past has come into sharp and direct competition with the West. Let me give some concrete illustrations. When I was a boy it was said they never could make any butter in the West to sell in New York. The only parts of New York State that made good butter were Orange and Chenango counties. They absolutely scoffed at the idea that Western butter could ever be produced to sell in that market. But the moment that men developed the method of shipping articles in refrigerating cars good Western butter was taken to the New York market. At once the monopoly of 3 or 4 counties in the New York market vanished, and the profit of those counties in the dairy business was gone.

As to increase and decrease in the value of land, I can not give details for the whole country, because I am not familiar with it. The farm lands in southern Minnesota began to advance quite markedly somewhere about 1890, and kept advancing until 1893, when that movement was checked. In northwestern Minnesota they did not experience any advance at that time. In fact there was at that time what might be called a checking of the movement which had been felt before that, and which had grown up with the rapid settlement of that section. There was a period of discouragement among the farmers, voiced in a great many ways. Land did not show any large decline in selling price. Its sale practically came to an end. Then came our panic and other factors that checked for the time being the sale of lands in southern Minnesota. The prices, however, continued to be what the business man calls firm. In the last year and a half there have been what the business man terms sharp inquiries, many inquiries for lands, and a very marked upward tendency in the prices, not only in one part, but all over the State.

Q. (By Representative LIVINGSTON.) Which do you consider the best for the farming interests of the country, small farms or large farms?—A. There is no question in my mind—the small farms. They are the better. In considering the size of the farm for profit I might give you the answer that was given me by a man in Minnesota who owned 1,400 acres. I said to him, "What do you think of the size of a farm for successful farming? You have been very successful." He was the most successful man in all that country. He said, "The small farmer is the one that makes the profit."

Q. Chiefly owing to the fact that it is worked by his own labor and under his

own control and supervision?—A. You might find on the farm or in the shop a great many men who can direct their own labor wisely who can not direct that of others. Where one man can direct the labor of others wisely there are 10 men who can direct their own labor in that way.

Q. (By Mr. A. L. HARRIS.) What do you know of the Dalrymple farm in Dakota?—A. I do not know very much. I consider that all those big farms, including the Dalrymple, are in the market for breaking up, just the same as those big farms of southern Minnesota are all opened—cut up. I can only say this in a general way.

Q. (By Representative GARDNER.) The New Jersey farmer was prosperous while he got \$1.50 for wheat, but competition since the war brought down that price to the prices which lately ruled. Have you any opinion as to how much of that has been the effect of opening the wheat lands in the West, and how much of it to the opening of wheat areas in other countries?—A. I can give my opinion and the reasons for it. The reason is the only thing that is worth anything. If that is not worth anything, the whole thing is not. I find in Minnesota, which may be called the center of the wheat area, that the gold value of the wheat on the farm, as given by the Agricultural Department for 5 years about the close of the war, averaged about the same as it has averaged the past 5 years, or, if anything, a little less. Wheat there at the center of its productive power in the West has remained substantially unchanged in price. In other words, the price at which wheat is produced in this country or sold in New Jersey is determined by its cost in the great wheat section of this country plus its cost of transportation to the other sections. The wheat in New Jersey brought a price in 1865 which was substantially the cost in Minnesota plus the cost of bringing it to New York City. The wheat in New Jersey sells for that to-day, and the wheat in Minnesota, taking five-year periods, was substantially about the same in 1865 as it is to-day.

Q. Assuming that the entire Western wheat field is eliminated, what would have been the effect of the foreign wheat?—A. I can not see that that brings in anything more than another field. That is, the world's wheat field is part in Argentina and part in Minnesota and the Dakotas. Without that foreign development it would all be there in Minnesota. The condition of price the world over is its cost in its cheapest market.

Q. You mean practically the same results would have followed to the New Jersey farmers if we had not settled our Western country?—A. Yes; either with or without that. I would not want to say definitely except in this shape. It is a very difficult thing to say what would have happened if something else had not happened. One of the conditions of modern agriculture has been a change in every part of the world. To say that such a change does not affect prices would be ridiculous.

Q. Would you state it this way, then, that the price of wheat in New York and New Jersey could not have remained above the Liverpool price, plus any freight, and stayed?—A. The United States farm determines the price of wheat the world over. I have sometimes said that the man who raises 5 acres of wheat in the United States in connection with a farm with diversified crops is the controlling factor. Let me illustrate. Any mechanic who is familiar with the work in the city knows that the man who works a hundred days in a year must for each of that hundred days get three times the wages as the man who works 300 days, or else he is running behind. He must have a margin of wages three times as much as the other man; and on that basis we fix the wages of a great many crafts. The carpenter and the out-of-door worker gets a wage scale higher than the man who works at woodcraft inside, and though the latter works more days in a year, in a year's work he makes no more, and on the number of days depends to a certain degree the rate of wages. Now, then, wheat raising on the frontier means work by the farmer for about 60 days. When wheat is raised by the man who only works 60 days a year, and, as somebody expressed it, sits on the fence or a dry-goods box the balance of the time and curses the Government, and the man who raises it comes into competition with a farmer who works 300 days a year, he must go to the wall, and that is what is being done in this country. And it is that fact, rather than cheap labor in other parts of the world, that is fixing the price of wheat. It is the small farmer of Minnesota and of the Northwest who is fixing the price of wheat. On a farm of 100 acres, instead of raising 50 acres of wheat, he has 10. He keeps some cows, he raises some oats and feeds to the stock. That 10 acres of wheat can be raised, and every cent of it is so much added profit to his farm in addition to what he might turn off in any other way. By having a widely diversified system of farming, he and every one of his household work 300 days, excepting such days as for his own pleasure he lays aside. He is a 300-day worker, and when he comes into the wheat market he determines the price in the United States. He is the man, and not the man in Argentina or India that works 60 days in the year, who determines the price of wheat.

Q. (By Representative LIVINGSTON.) The same way with cotton?—A. Yes.

Q. (By Representative GARDNER.) And under all lies the law of supply and demand, does it not?—A. Yes; certainly. But the keen-brained man is the factor of the production.

Q. (By Mr. A. L. HARRIS.) Is that the same with all agricultural products?—A. I do not know of anything that it will not apply to.

Q. (By Representative GARDNER.) Are you prepared to say anything on the effect on the farmer of this system of selling his crop before he plants it in order to get his seed and fertilizer and that sort of thing?—A. No; those are two distinct things; the liens and the future sales. Where the man is not an independent man, is not a free man industrially—I do not mean by that anything except freedom that comes with money; the man who has resources is free; the man who has not resources is not free; we may cover up our pretenses to the contrary notwithstanding—if there are future contracts or contracts concerning the future, made by such a man, who is compelled by his necessities to accept any contracts that may come, that man's future contracts will be always to his detriment. Whether he has made an agreement to pay a lien on his horse, or made any other loan due in the future he has an immense margin against him, and the fewer his resources the greater that margin must of necessity be. It is expressed in the matter of liens by the interest rate. The man who has plenty of resources can borrow money on his farm. If he has available resources and has character back of it, as that is also considered in loaning, he can borrow in Minnesota at 5 per cent on a farm. The man who will loan his neighbor who is known to be a sober, temperate, and prudent farmer, at 5 per cent, will ask 7 and 8 per cent from another neighbor right by his side on just as good a farm, where he does not have these qualities, and then he will want to shave some considerable more if this borrower represents a still lower grade of intelligence and foresight. If instead of a loan secured by a mortgage on land you substitute loans on personal property, liens on crops and the like, the creditor must of necessity have a still larger margin. I fancy—I do not know practically—that where there are crop liens and sales on crops that involve a loan, the poverty, the ignorance, and want of character upon the part of the borrower results in a tremendous loss to the producer.

Q. What, if any, effect, in your judgment, would that have in the fixing of the final price in the market?—A. None. That is, the system of selling under those circumstances, which means a tremendous loss to the producer, does not affect, in my opinion, the final prices that are realized on the products in the markets of the world.

Q. (By Mr. FARQUHAR.) You mean by that that the producer has no share at all in the general market outside.—A. No.

Q. (By Representative GARDNER.) What is the effect on the general prices which the farmer gets for his product?—A. The man who sells under those conditions always gets less than the independent farmer.

Q. Assuming 100 producers of a given crop in different localities, and 70 of them sell at the common price in the spring, taking an advance from the broker, is that not an agency in fixing the price which the broker will pay for the balance of the crop? Do not late spring prices depress fall prices?—A. Your question involves, if it is answered in the affirmative, the supposition that those brokers who have farm products to sell do not wish to make any profit upon that which they have bought. But the quantity which they have bought is larger than that which they can buy and on which they can make a profit by buying. If a lot of brokers have 70 pounds of cotton out of a possible 100, their possibilities of profit on this 70 pounds which they have is, of necessity, more than they can make on the other 30, and the moment they get half, that moment you have forced every one of them into what might be called a conspiracy to advance prices, in order that they may make something on what they have. They are in the conspiracy, if you can use that word. They are bound to conspire together so far as any action can go together, to get the largest possible prices that the supply and demand of the world will admit for their product.

Q. That is a standing conspiracy the world over in trade; but are there not elements in it that induce them and other brokers to offer a lower price for the remainder, and does not the example of others having sold have an influence on the farmer who has held back to sell?—A. I can not see it, because when they begin to buy that other 30 per cent of which you are speaking they are already selling, and their interests as sellers far outweigh their interests as buyers.

Q. They are buying in the southern and selling in the northern or European markets?—A. They are buying in a market in which other buyers are free to purchase, and are selling in a market in which these men of whom they bought, who are themselves free, can sell.

Q. Is not an independent raiser, who can afford to sell his cotton, prejudiced by the man who sells in the spring under the market price?—A. The only thing I have

ever secured that may be taken as bearing upon that question is this: I never examined the cotton market. I have examined the wheat market both in Chicago and Minneapolis. The one is a purely speculative market—Chicago—the other dealing with the sale of actual wheat. Chicago is the greatest speculative market in the world; Minneapolis the greatest market for the handling of positive, actual wheat. Examining prices in these markets, I found this situation: If one buys cash wheat the 1st of September and holds it in storage until the 1st of May, he would, in the course of 30 years, lose on an average 2 cents on every bushel that he bought on either one of these markets. In other words, throughout the Northwest the boards of trade have their prices in the fall nearly always raised 2 cents above the average which the situation the following spring will justify. The so-called bulls of the market on the average for 30 years have unduly raised the price of wheat 2 cents a bushel in the fall. The farmers and those associated with them by living in this country are always bulls on the market. Each year these bulls, who think that there is a profit in wheat, go in and buy and sell their futures with the idea of making money on the rise. As a rule that is never realized, and taking the last 30 years as a whole, the actual farmer selling his wheat at its harvest receives 2 cents a bushel extra which comes out of the speculators. The men in the city who handle actual wheat do less of this speculation than the populace suppose. The great mills of Minneapolis when they buy in the fall, as they often do, 30,000,000 bushels, protect themselves against all fluctuations. When they buy 10,000 or 20,000 bushels of wheat, they sell a future against it. They make somebody else carry the risk. What they are in business for is to make a profit on milling. They are certain that, in the long run, the price of wheat will by its variation cause more loss than it will profit. They do not want to carry any risk on this particular crop. They want their profit on the grinding of wheat. They will sell this future and buy it back when they want to grind that wheat. Of course, occasionally, that puts the mill at the mercy of the speculator. A few years ago, you all may remember, the Chicago speculators used these futures to make a squeeze on the Minneapolis millers. They would not take the Minneapolis grade wheat, and forced the price up. They manipulated the grain inspection in Chicago. No. 1 Northern was not accepted as equivalent to No. 2 Chicago, and hence the market squeezed the millers a little. All that the Minneapolis mills were seeking by their original future sales was simply to protect themselves and let somebody else carry the risk of price fluctuations. A great many of these options, a larger proportion of them than most people are aware of, are purchased by the farmers and people who live in the country, who always think there is going to be a larger price than is realized. City men are not so generally interested. If they are engaged in the legitimate business of handling wheat they seek to let somebody else carry the margin. They are not interested in an effort to force the price up or down.

Q. I do not see the difference of the miller buying day by day, when he wants wheat, and buying an option and selling one against it.—A. There is a great difference. What these men want is wheat of certain grades. They want that wheat in their possession and control in order that they may produce certain grades of flour which meet their market. They go in and buy this wheat, put their investments in it. All they want to do with their sales of futures is to protect themselves against fluctuations. They want to keep the actual wheat in their possession and control until they are ready to grind it. By buying in wheat of certain grades in the fall they are able to maintain their standard of flour and thus continue business.

Q. But on a given day they must deliver that kind of wheat according to the option they sold?—A. They run their risk of buying back that option. When they come to make their wheat into flour the price at which they sell their flour will be governed by the price at which they buy that option.

Q. (By Mr. A. L. HARRIS.) What have you to say in regard to purely speculative transactions, known sometimes as puts and calls, on a market; that is, as to their effect on prices of options, etc.?—A. Unquestionably they make temporary fluctuations, but when they do, in the nature of things, so far as they affect prices, they always boost them.

Q. (By Mr. FARQUHAR.) You do not think it is disastrous to the farmer?—A. Excepting as the farmer assists in the puts and calls. Great numbers of them are put on the wrong side of that as speculators. As legitimate farmers dealing in wheat I do not think they are hurt.

Q. (By Representative GARDNER.) Does the farmer go on the board of trade and gamble?—A. Very largely; he and other residents of the country and country towns are the lambs that are shorn by the boards of trade. You stop the farmers and the residents of the small towns from gambling in wheat and you stop a great share of it.

Q. (By Mr. A. L. HARRIS.) What have you to say in regard to foreign markets for farm products, and their effect upon the farmer?—A. Ultimately there will be an immense market for some of our products in Asia, a market that will cast into the shade the European market. I think we are on the eve of it, and a wise policy with reference to the Orient will give our farmers that entrance to a market which, for the cereals and for almost everything else, will be equal to that in Europe.

Q. (By Mr. FARQUHAR.) And Liverpool will not make the price for the Orient?—A. I do not believe that Liverpool now makes the market. The world demand makes the market. You increase by 400,000,000, the population in Asia, the demand for certain of these cereals, and you thereby affect prices very largely.

Q. (By Representative GARDNER.) Liverpool is merely the announcer?—A. It is not the determinator; it is the place where the price is announced. Under the head of remedial legislation I will say in brief, with reference to the regulation of trusts, that the conclusion of my study leads me to lay the stress not on trusts, but the legal regulation of corporations as a whole. The attempt to pick out the trusts from among our corporations I consider to be more productive of evil than good. There is a tremendous need of bringing all corporations, which are creatures of the state, under complete public control, and to cause all their affairs to be public affairs. By raising the question of trusts we hide the real issue. There is a difference in trusts and the men who are back of them; there is a difference in corporations and the men who are back of them. Some corporations are organized by villains to swindle the public. Some of our trusts are organized in that way, and some trusts are legitimate, as some corporations are, and have back of them honest men. The illegitimate cry about all trusts hides the distinction between those organized for legitimate purposes and those organized for the purpose of fleecing the public. The next 10 years will see the people of this country, by the collapse of trusts organized fraudulently for the purpose of swindling the people and by the collapse of small corporations organized for the same purpose, and not under public control, losing manyfold more than they will lose by the exactions of so-called trusts in constraint of trade.

Q. Would you add with probable panic and loss of labor?—A. Yes; absolutely; and we are drifting, as a result of all those things, in a mad frenzy of excitement in wrong directions. I believe a large amount of the talk against trusts is fostered by certain classes of men who are promoting them. They are interested in making the people believe that there are profits on all the watered stock that they issue. They do this in order that they may sell that watered stock to the lambs of the public. I believe that there are men even in public life interested in trusts who are advocating laws against trusts and talking in that way. They expect to make their money not in the way of actual profits on the business, but in selling the stocks and letting the people suffer when the collapse comes. I believe the whole agitation about trusts should be transferred to the corporations. We should know all about them, from the least to the greatest. We should have some legislation that will give knowledge, give the people an opportunity to know the real merits that lie back of all these schemes. All their transactions should be open to the supervision and regulation of the state. I deprecate some of the present talk about trusts because it delays the effort to secure the regulation of corporations until we have all big ones, when our job of regulation becomes increased in greatness. I want to see it begun now before all of our capital goes into large aggregations.

Q. (By Mr. A. L. HARRIS.) What have you to say about the existing antitrust law?—A. Most all of the so-called State and national laws relating to trusts have assisted in giving the trusts other forms. If anything, they have assisted in helping on the movement for the organization of the great capitalistic corporations instead of deterring them. They will do that, and thus cut but very small figure for the benefit of the people in putting off the day which we ought to have of the regulation of the corporation, attracting our attention from the real issue, real necessity, and doing more harm than good.

Q. From what source would you have the law enacted regulating these corporations?—A. Most of these corporations are creatures of the individual States, and they must, of necessity, go for their regulation into the State itself.

Q. (By Mr. PHILLIPS.) The State in which they are organized?—A. No; I think the State in which they do business may, if it deems best, regulate them just the same as it regulates our insurance and banking companies. When an insurance company doing business in one State is organized in another, the State in which it does business demands from that insurance company the fullest publicity relating to its affairs, and if it fails to get that in a satisfactory way it debars it from doing business. Any State has, in all matters relating to corporations, whether trusts or otherwise, the power to bar any corporation from doing business when

it fails to observe a reasonable regulation. Any State has the power to begin to require this publicity relating to corporate action. It has this power over not only the corporations created by itself, but those created elsewhere. If any State begins regulations in that line the value of a corporation created in a State like New Jersey, for the purpose of getting around the laws of some other State, vanishes.

Q. If the materials barred be essential to the citizens of other States, where a sufficient market could be found, might not a corporation leave that State alone and yet have a large monopoly in those materials?—A. That is true. In dealing with these corporations we must take into consideration the article or articles which they handle, create, manufacture, or deal in. I can here only set forth the general principle of action. We have already worked out the principle of regulation for one class of corporations. That principle which is involved in our insurance laws would doubtless have to be very greatly modified in its application in details for each of the various lines of industry or articles in which the trust operates or is connected with. I have not given enough attention to the subject to go into details, say, for a concern handling steel rails. If all the steel-rail corporations of the United States should come into a syndicate, it would hardly be practical for a State like Minnesota to say, "We will bar their rails," because we must have rails. The State must seek to apply the same general principle of regulation along some other line. I have not worked out the way. I fancy it would require possibly 25 years of legal discussion and investigation and decisions to find a way to do it, but I believe that it can be done, and it is along the line of that which I believe in general is practical. But the present legislation, which is largely prohibitive, is in the line of the legislation of England from the year 1800 to the beginning of this century against organizations in restraint of trade, which was largely there the regulation of labor. All those attempts in England for 500 years were futile. In so far as the organization of capital is beneficial and profitable it will occur in spite of all this legislation, just as the legislation against laboring men, when the desire was in their hearts for freedom, was futile. You can not legislate down the public aspiration or aspiration for freedom. That fact is demonstrated in all these 500 years. You can not any more legislate against the possibility of men's profits. That is a law of aspiration of another class of men, when these profits are legitimate. You can regulate it and prevent a violation of the rights of others.

Q. (By Mr. A. L. HARRIS.) Have you anything to say in regard to the Federal legislation on the subject of pure food?—A. I think the Federal legislation should seek in all articles of interstate and international trade some inspection. Thus, there is a loss to the American farmers to-day from the fact that some of our corn shipped to certain ports in Europe reaches there in an unmerchandiseable condition, and the foreign dealers who buy it upon the grades warranted by certain of our export cities are ruined by getting the corn on their hands unmerchandiseable, and that reacts to the detriment of all American exportation of corn. I understand that to be the case. If that is the case the Department of Agriculture should, and I understand it is looking into the matter. It should in some way take cognizance of it and find out what places of export are thus permitting a certificate of grade to be of no value whatever. I think the Government should seek to protect the good name, as we call it, of the American farm products in the markets of the world. So far as our food products enter the world markets, so far the United States should come in and with legislation provide facilities of guaranteeing the purity of all the products, direct or secondary, of American agriculture. We should have it that American meat, canned or otherwise, going to the markets of the world should not have upon it a taint of suspicion such as that which grows out of our army contracts.

Q. (By Representative GARDNER.) Would you carry out that idea by advocating a national grading?—A. There should be certain methods of investigation that would guarantee the soundness and purity of goods put upon the market.

Q. (By Mr. FARQUHAR.) In the meat products, etc., is it not pretty well done now under the Bureau of Animal Industry?—A. I think it is as a whole, and I think the Agricultural Department is taking up the report of the abuses of the grades of corn, and I believe it can be safely trusted. If there is legislation needed along that line, the Agricultural Department will undoubtedly advocate it. I believe that wide-awake, aggressive Agricultural Departments, such as I think we have to-day, can do a vast amount of good.

Q. Is the cause of the necessity dishonesty?—A. Not always; of course, carelessness sometimes comes in.

Q. You would not give that as a big percentage?—A. Carelessness is about as much a factor as dishonesty in this world.

Q. (By Mr. A. L. HARRIS.) Carelessness would not make adulteration?—A. Carelessness might possibly lead to the shipping of damp corn when it is not up to the grade of dryness.

DISTRICT OF COLUMBIA, CITY OF WASHINGTON:

I swear that the statements made by me of my own knowledge in the foregoing report of my testimony before the Industrial Commission are true, and that all other statements I believe to be true.

LE GRAND POWERS.

Sworn and subscribed before me this 18th day of November, 1899.

N. A. BARROWS,
Notary Public.

CHICAGO, ILL., August 9, 1899.

TESTIMONY OF MR. W. H. BURKE,

Editor of Farmers' Voice.

At a meeting of the subcommission on agriculture in Chicago, Ill., August 9, 1899, at 2.45 p. m., Mr. A. L. Harris presiding, Mr. W. H. Burke, being duly sworn, testified as follows:

Q. (By Mr. A. L. HARRIS.) You may state your residence.—A. Evanston, Ill.

Q. Your occupation?—A. Editor of the *Farmers' Voice*, Chicago.

Q. How long have you been editor of an agricultural paper?—A. Three years and more.

Q. What was your previous occupation?—A. I was a reporter on the *Chicago Record*; and I was a copy reader on the *Chicago Record*.

Q. Have you made any special study of agricultural conditions or agricultural wants in this part of the country?—A. In a general way.

Q. You have the plan of inquiry before you. If there is any topic in the plan of inquiry which you prefer to dwell upon, you may take that matter up and give the subcommission all the information you have in your possession.—A. Well, I take it for granted that you are seeking to reach general conditions and causes. From my point of view, the questions as here enumerated are purely statistical, and while I have some statistics here that would be of interest along the line of the taxation of land, there are some general conclusions I have reached as an agricultural editor that I would like to submit.

There was instituted by the Agricultural Department, in 1896, an inquiry in Cattaraugus, Chautauqua, Putnam, and Westchester counties, New York, with regard to the conditions of taxation there as affecting the farmers. The general conclusion of the Agricultural Department, published in what is known as Circular No. 5 of the Division of Statistics, is that the farmer is bearing a very, very large proportion of the taxes.

I hold in my hand a pamphlet entitled *Recent Results of Property Tax in New York, Massachusetts, New Jersey, Ohio, Illinois, Missouri, West Virginia*, by Lawson Purdy, 111 Broadway, New York, compiled from official reports. They are all authorized reports. If you care to have me do so, I will leave a copy with you. The information was gathered from several sources. In Pennsylvania there was a commission appointed to investigate the tax law, by Governor Hoffman. The figures quoted from Pennsylvania's report are from the second report of that commission. The Massachusetts commission was appointed to inquire into the expediency of revising and amending the tax laws of the State, and their report was issued in October, 1897. In New Jersey a commission was appointed by Governor Griggs, now the Attorney-General of the United States. Governor McKinley appointed a committee in 1893 to investigate the question in Ohio, and I have an impression—I do not just catch the line here where it is stated—that the figures here quoted are from the last report of the State auditor of Ohio. In Illinois I presume the figures are, of course, taken from the last report of the State auditor. In Missouri the figures are taken from the last report of the State auditor. So I may say that these figures are from authoritative sources, and not mere guesswork of anybody interested in a particular theory of taxation.

In this pamphlet I notice that in Monroe County, New York, which contains the city of Rochester, although the real estate is more than double in value that of Oneida County, the personal property in Oneida County is nearly double that of Monroe.

Q. Assessed valuation?—A. Yes. Oneida is one of those which have been investigated by the tax commissioners. The New York report is right along the line as taken in these four counties, and it shows that the rural districts are paying on personal property and real estate a tax entirely out of proportion. In the four city counties of Missouri personal property amounts to 15½ per cent of the total assessed value, and in the remainder of the State 29.67 per cent. It means that everything is visible with the farmer. The farmer can hide nothing.

Q. (By Mr. CONGER.) You mean, then, do you not, that in the cities the personal property goes untaxed?—A. Certainly.

Q. (By Senator KYLE.) Because it is hidden?—A. Because it is hidden in one way and another. Every one knows, for instance, that the average wealthy man in Chicago spends more money in one month than the average farmer does in a year upon himself. There is no guesswork about it. The average man living in Chicago and worth ostensibly \$10,000, as compared with the farmer whose property is worth \$10,000, will spend more money in one month than the farmer will in a year. He will have more rings, more watches, more fine furniture, more of all that enters into personal property than the farmer will, and yet much of it is so minute as to escape the tax assessor. And there are good grounds for believing that even where property is not susceptible of being hidden, the tax assessor is influenced in his estimates. For instance, I was sent some years ago as a reporter to investigate the matter of the Pullman Car Company's taxes. I found property estimated to be worth \$31,000,000, and at the county treasurer's office discovered that the company paid about \$15,000 in taxes, although the company paid an annual dividend that time of \$7,000,000.

Q. (By Mr. A. L. HARRIS.) What was this property?—A. It was the town of Pullman and the Pullman works.

Q. It was tangible property?—A. Tangible property, yes; much of it realty.

Q. (By Senator KYLE.) Pro rata, how much should they have paid?—A. Well, they should have paid taxes on a valuation of not less than \$8,000,000.

Q. (By Mr. CONGER.) At about what per cent?—A. I can not remember what the tax was that year.

Q. Well, approximately—1, or 3, or 5?—A. I would not want to approximate because I am afraid I would not get close enough, but you can see that \$15,000 is ridiculous—ridiculously low. Spread thirty-one millions of property over Illinois farms; what would it buy? It would buy whole counties which support their schools, their entire local government, their own road taxes and all to the amount of hundreds of thousands of dollars, from moneys that are paid on smaller valuations than the Pullman Car Company's.

Q. The taxes on thirty-one millions of farm property, you would think, would be \$40,000 or \$50,000?—A. I think that would be a very small estimate of what it ought to be. A \$31,000,000 county is a pretty big county.

(Witness reads the following with respect to Missouri from pages 23 and 24 of above-described pamphlet:)

"In the city counties personal property amounts to 15½ per cent of the total assessed value, and in the remainder of the State 29½ per cent. It does not, therefore, appear that taxes on personal property benefit the farmers in Missouri. But comparison of St. Louis city with a typical farming county, like Camden County, where town lots are only 4 per cent of the value of real estate, shows even a worse condition of affairs for the farmers. In St. Louis city personal property amounts to 14½ per cent of the total valuation and in Camden County to 37 per cent. St. Louis city has 65 per cent as much real estate value as the rest of the State, but only about one-eleventh as much money, bonds, and notes." That will give you a pretty good idea, and what is true of this is practically true of the several States named here. The farmer pays on everything he has.

In California I understand they have adopted a form of classification which requires that 91 listed articles must appear in all lists; and of that list I have enumerated the things which are hidden, those which may be hidden, and the things which can not be hidden by the farmer. For instance, among those things which can be hidden are State, county, and municipal bonds, jewelry, plate, watches, and so on. Those are not so easily hidden: may be or not. I find, without going into the whole thing, that there are 11 which you can positively hide. Of the 91 articles, 42 are absolutely peculiar to the farmer, such as hay, hops, butter, cheese, wood, tanks, horses, thoroughbred horses, standard horses, American and standard bred cattle, beef cattle. Everything else that is enumerated here is practically met on the farm; that is, the farmer would stand on a great many of them. I have noted as instances of what they would not have lumber, coal, fixtures of stores and others, goods, wares, and merchandise; law libraries, medical libraries, railroad rolling stock, franchises, etc. These are things that he would

not have, but 42 of them are absolutely peculiar to him, upon which he must pay, and upon all but the 11 or 12 he would stand equally with other members of the community in owning.

Q. (By Mr. A. L. HARRIS.) I wish you would outline your method of taxation in Illinois. How is the value of the property, real and personal, ascertained?—A. The assessor visits the property, presumably, and fixes a value on it, I think, annually. Our personal taxation is now under an entirely new law; it is made up in the form of schedules submitted to the individual. He renders his own statement, subject to the board of review. Chicago, as you know, now probably is in the throes of a taxation excitement. I was noticing in last night's Post the figures of increased personal-property taxation. As a result of the new law, after having been revised, I believe, by the board, I should say, broadly speaking, that it has increased about 46 or 47 per cent.

Q. (By Mr. CONGER.) Does the property owner making out this schedule of personal property which is submitted support it with an affidavit?—A. My impression is that he supports it with an affidavit. I am not sure about that.

Q. Have you any data to show what per cent of the property has heretofore escaped its burden?—A. No; that would be absolutely impossible to know, and this is why personal-property taxation works so disastrously to the farmer, although the farmer is chiefly to blame for the personal-property tax.

Q. (By Senator KYLE.) How is that?—A. He is demanding it always. He has always been at the legislature demanding the personal-property tax on the mistaken hypothesis, so far as the results go, that the business man would escape if the personal property were not taxed. It has been a great mistake of the farmer, and one which he is just beginning to see.

Q. What is your own idea as to the correction of this difficulty?—A. Well, now that you have asked me that, I will answer frankly. I am a single taxer, and I believe there is no other form of taxation that has ever been invented by man that will collect an equitable, just, and perfectly even taxation everywhere and under all circumstances.

Q. (By Mr. A. L. HARRIS.) You suggest the assessment of real estate on the Henry George plan?—A. Yes. Put the taxation not upon real estate but upon land value, upon site values, for a building is a part of real estate. If you use the term real estate, you greatly confuse the meaning.

Q. (By Senator KYLE.) That is, you include the building with the site?—A. You do in real estate. The term real estate includes the fixed improvements.

Q. How would it operate with a man who had most of his money, probably millions, in simply personal property?—A. Well, no man can own personal property to a very large amount which is not in the form of jewelry and small trinkets, except in some way or other it is related to land. If you refer to stocks and bonds, speaking broadly, there is no stock or bond issued to-day which does not find its basis in land.

Q. How about the merchant who may have \$1,000,000 invested in a stock of goods?—A. The hypothesis of taxation should be to encourage trade, to encourage industry, and not to put a fine upon trade. It would be equalized through the whole community, because the merchant would sell his goods so much cheaper. Now you not only pay the tax, but you pay an interest on the tax. My view is that every time you pay a tariff tax you pay the tariff tax plus interest. You pay interest and profit on tariff taxes. I buy a thing in England for \$1; the tariff tax at New York is 50 cents; I add not only 50 cents, but I include that in the whole thing and charge upon it my ratio, which may be 25, 40, or 50 cents. The merchant will tell you so. That is the universal custom, and every tax you put upon industry you take so much out of the great common people. It can not be otherwise. It is nature's law of gravitation in commerce that makes it so.

Q. You would have this man escape taxation, the merchant with a \$1,000,000?—A. He would not escape. He must have a great big store to handle that property, and he must pay a big rental for that property, which goes into the public treasury. There is no such thing as escaping the public treasury if you have anything.

Q. You would say first he was paying rent to the property owner?—A. He does not pay any rent to the property owner. The property owner's rent goes to the State. Let us at this point differentiate the buildings from the ground. Schlesinger & Mayer, of this city, occupy a little corner about 120 feet long by 60 or 80 feet wide. The ground rental of that is \$120,000 a year. That is entirely irrespective of improvements, the building, and they are to pay that for 99 years to Marshall Field and his assigns.

Q. Under the present system he pays taxes on his goods besides that?—A. Yes.

Q. If he had a store selling diamonds, and had \$1,000,000 worth of property in

there, under your system it would escape taxation?—A. Yes; entirely, because there would not be an actual escape.

Q. Under the present system the farm, fences, and buildings together are all taxed; under the single tax he would simply have his cows, horses, harrows, and plows exempt?—A. No; there would not be a single tax upon him except upon the land value.

Q. (By Mr. A. L. HARRIS.) As the State has parted with the title, how would you get back now?—A. The State never parts with the title.

Q. When the Government is selling its land off, the purchaser, on receipt of the deed, owns the property in fee simple?—A. Yes.

Q. Now, how would you get back to make the tax a rent on that, and thereby, of course, destroy the title except so far as he has a right to use it and pay the rent?—A. And sell it. His fee simple is not injured.

Q. Has he any title that he sells? Does he not simply sell his right to hold it?—A. But the fee simple is not altered under the single tax.

Q. Of course, theoretically, he owns the buildings placed on the land and the improvements made. The original theory is that by taxing improvements you tax labor, and that labor should not be taxed. We will say that the ground upon which this hotel stands is vacant. It is valuable simply from the fact that labor and capital have put up buildings all around; the great city of Chicago is here. A society created all the value. It is valuable on that ground only. In paying rent only upon the ground value of this city, is not labor taxed?—A. No; I can not see why it is or how it is. I do not see where labor enters at all. Labor does not enter at all, because you are simply taxing the ground value.

Q. (By Mr. CONGER.) You would assess an acre of ground in Arizona the same as you would in the heart of Chicago.—A. You notice that I said the site value.

Q. Yes. What do you mean by the site value?—A. I mean a particular piece of ground which has a peculiar value by means of its location. Your question would be impossible.

Q. I asked the question, expecting that your answer would be no. Then I was going to ask you why you would assess this acre of ground in Chicago more than the other?—A. Society has created all the value which comes to this property. Chicago at one time was a barren place without a building or a man in it. The first man who came here was a blacksmith, I understand, who located out here a few miles and built a blacksmith shop. Now, there was not a particle of land value here at that time which could be stated in figures. There was not one iota of value in this lot more than there was in any other. What is it that creates value? Value is a relative term. Demand creates value. As a matter of production there might be, but speaking economically, there was no value in the city. Now, then, the time that several families gathered around this blacksmith shop some one said, "Here I have 2 children; you have 3 or 4 children, and so on. We must have a school here." "Certainly." Now, then, immediately there follows a necessity for public revenue. The question is, how shall we fix that revenue so that each individual shall pay his just share? When you go into a store and buy 10 yards of goods at \$1 a yard and pay \$10 for it, you have no objection if a man follows you in and buys 5 yards of the same goods and pays \$5 for it. Now, the hypothesis of the single tax is this, that society created all these values; that has given a form of taxation which is not taxation at all but simply rental, which is perfectly natural, is regulated by the great law of supply and demand, which is nature's great regulator, as you know, in commerce and finance and every direction, and that there can be no possible injustice to anyone if each pays for what he enjoys.

As to your question with regard to labor's being taxed: The laborer who would pay a higher price for this lot because this building is here is proportionately benefited by the presence of this building here, as he is by the presence of the church, the schoolhouse, or the county court-house. He is paying more, and here is the cause—he is paying exactly what you and I and every other man would.

Q. (By Mr. A. L. HARRIS.) Now I get a title, but I do not get the title under Henry George theory.—A. You are mistaken. I do not know what the constitutional provisions are, but presuming there was no constitutional impediment, if the Illinois legislature should pass a resolution, containing no more than 50 words, to the effect that from and after January 1, 1900, all taxes within the State of Illinois should be assessed upon the value of the land, that would put the single tax into operation without changing the modus operandi of collection, the modus operandi of assessment, or anything at all. The only difference would be that then land values could be traced as on a map. You would know exactly what your neighbor paid, because if he had the same amount of land that you had and if he adjoined you there would be no reason why it should be less valuable than yours, or more.

Q. (By Senator KYLE.) That is, the same sort of land?—A. Yes.

Q. The test would be what it would rent for in the open market?—A. Yes; and there enters the law of supply and demand.

Q. (By Mr. CONGER.) It would seem to me that if you are going to assess it on land value, you are, in fact, assessing the improvements, since the land is more valuable because of these improvements.—A. Excuse me, you are not correct in stating the question in that way. You will see you are wrong instantly, if you apply that statement to the single tax, because the vacant lot lying next to this lot would be taxed identically with the built-on lot.

Q. That vacant lot has a higher valuation because of the surrounding improvements. You take all the improvements plus the land?—A. That is exactly our contention. If the city of Chicago—

Q. (Interrupting.) What I was going to ask you was whether in your opinion the farmers in the State of Illinois support your theory and want this single tax?—A. No; I do not think so—any part of it. I do not believe that the farmer or the average business man comprehends the single tax.

Q. (By Senator KYLE.) I want to see how it would apply to two farms lying side by side. One farm has good buildings and fences, and opposite that is one of equal size, with land equally as good, but having a log house and poor fences; what would be the basis of assessment then?—A. The natural value of the land.

Q. Not the improvements?—A. No.

Q. What the land would rent for divested of all improvements?—A. Yes; you see that the farmer would then be paying absolutely not one tithe of the taxes paid by him to-day. If he did not have the idea that Mr. Harris has, that it would disturb his fee, he would not care, he would favor it. But let me call your attention to this one point: It does not disturb the fee; the State does not give up the title to the land, even as a fiction. The nonpayment of taxes causes the land to revert to the State always.

Q. (By Mr. A. L. HARRIS.) Not in our State. The land is always sold for taxes. A. Exactly; by whom? The State sells it. How did it get possession of that land to sell it? You see what I say is true; it always reverts to the State; always really belonged to the State.

Q. (By Mr. CONGER.) Do you think the farmers generally are dissatisfied with the proportion of taxes they are compelled to pay?—A. Yes. I can speak with some authority on that from the action of a large number of farmers before the State legislature of Illinois last winter. A bill was introduced that road improvements should be carried forward upon something like this basis: 50 per cent to be paid by the State, 35 per cent to be paid by the county in which the improvement is made, and 15 per cent to be paid by the individual whose farm abutted the improvement. I think those were exactly the figures. But the farmers defeated that measure, upon the ground that that 50 per cent and 35 per cent very largely came out of their pockets also, and that while they would be paying 15 per cent absolutely as individuals, they were generally paying a very large proportion of the whole 100 per cent, showing that they realize how unjustly they are being treated in the matter of taxation.

Q. (By Mr. A. L. HARRIS.) Who is it that makes the levy, say, for the school district in your State?—A. The school board makes the levy.

Q. Who makes the levy for the township tax—the township officer authorized by law?—A. Yes.

Q. Who makes the levy for the county tax?—A. The county assessor.

Q. Now, substantially, does not the farmer vote upon himself the burden of local taxation?—A. Doubtless he does, but upon the hypothesis that the other fellow must pay his portion.

Q. Wherein would the farmer be benefited by putting the taxes exclusively upon land values?—A. He would receive his benefit in several ways, and in this notably—that appears on the surface. He would receive benefit from the fact that every railroad would pay upon its land values, right of way; that every great corporation which had the slightest relation to the land would pay in the same ratio that he did. Perhaps if I read to you a little while here it may help to answer that question.

(Reading from pages 22 and 23 of pamphlet referred to in first part of Mr. Burke's testimony.)

"While Cook County has more than one-thirds of the total real estate value of the State, it has only one-sixty-third of the value in watches and clocks possessed by the remainder of the State, one-twenty-second of the value in carriages and wagons, one-twenty-second as much money, and one-tenth as much credits. In 1894 the bureau of labor statistics of the State of Illinois made an exhaustive report on the subject of taxation. After giving a great many tables which showed conditions existing at the time, they said: 'The following tables graphically express

the demoralization to which Chicago has been reduced by the general property tax, and indicate the goal toward which every community subject to that or a similar system must invariably tend.' The tables are direct indictments of assessors of wealthy and influential property owners, and incidentally they condemn our constitutional principle of taxation itself."

From the table which appears on page 21, it appears that (reading)—"Cook County, containing the city of Chicago, has more than 12 times the value in town and city lots that it has in farm lands, and that the remainder of the State has 3 times the value in farm lands that it has in town and city lots. Yet the percentage of personal property to total valuation in Cook County is only 13½ per cent, whereas in the remainder of the State it is 17.7 per cent; and, in spite of the severe character of the existing law, it is perfectly obvious that only a small part of the personal property of the State is really listed for taxation." Now, there is where the advantage is to accrue from—indirectly, at least. Only a small part of the personal property of the State is really listed for taxation. Now, in making up your budget for school or State, you are always considering your personal property. Therefore every bit of personal property that fails of taxation somebody has got to make up. But the direct benefit of the single-tax system is that the farmer pays upon original land values. Society values, if I may use the term, do not exist there as in the town.

Q. (By Mr. CONGER.) Your idea is, then, that under the single-tax method the taxes that are now paid by people outside of Cook County would be borne by the land values of Cook County, or at least a large portion thereof?—A. That would hardly be the fair way to put it. Cook County would pay its fair share, which it does not do now. If they had a hundred millions to raise, Cook County would pay its proportion of that hundred millions, which it does not do now, or anywhere near. I have just quoted that the change within the year amounts to 97 per cent, I think.

Q. I understood you to say that if the single-tax system were put into practice the farmers would not pay a tithe, a tenth, of what they do. Who would pay it?—A. It would be paid in this way: Let me ask you what percentage of the entire land of Chicago do you suppose is actually built upon now? Boston has about 20 per cent of its land actually built upon. Boston is an old city. Chicago is a new one. I doubt if there is 15 per cent of Chicago's land actually built upon. That land which is not built upon is all held by speculators, and they will not sell to a man who wants to buy. I rode last night on my wheel 10 miles by unoccupied land that you can not buy a foot of for less than \$75, \$50, \$25, and it will not be built on for 12 or 15 years, but will be held there because the owners know they have a cinch. Now, if there is only 15 per cent of Chicago's land built upon, you can imagine that if Chicago has 10 to 12 times the value in city lots, there is where the taxation will rest.

Q. If the farmer, under your theory, would pay but a tenth of what he does pay, who must pay the other nine-tenths?—A. It would come back to where it belongs, and that is the whole society.

Q. (By Senator KYLE.) Are not those lots taxed now?—A. Some of them pay 82 cents a year.

Q. (By Mr. A. L. HARRIS.) Whose fault is that?—A. It is largely the fault of the general system that obtains.

Q. (By Senator KYLE.) You are proceeding on the theory that under the single tax all would be equitable, with perfectly just assessments?—Yes.

Q. Now, would that be true any more under the single-tax than under the present system?—A. I think so, for this reason, that there is such an admixture growing out of the present forms of taxation that nobody in the community can put his finger on—except in a few rare, individual cases, where one neighbor may know about another neighbor—you can not know about anybody's tax or anybody's property.

Q. We know it in all our towns. Here is somebody that owns a house and lot that has cost \$1,000 and it is taxed for \$1,200, and here is a man that owns one that is worth \$3,000 and the board of review puts it in at \$900. That is because of what, the imperfections of humanity?—A. Very largely.

Q. There would be the same humanity to tax under the new theory?—A. Yes. Just imagine that map as the town you live in. The building now is entirely eliminated from the map. Your neighbor, John Smith, who owns a big house and paid \$1,200 or \$1,500 for the lot, is down on this map. This man, who lives here, knows his land is worth exactly as much as John Smith's, and he paid exactly the same originally. They are all on this map, and you can see in 1 minute in the county treasurer's office what every man pays.

Q. You would have it so arranged that each man could tell?—A. Yes; there would be one vast map so you can tell.

Q. Could it not be done under the present system?—A. No; you can not do it. You come in and say, "My house did not cost me \$15,000. Here is the contract. I had that house built for \$8,000. Your guesswork is no good. You are simply guessing. You don't know anything about it." You can not devise a scheme of taxation, and there never has been one devised, to open all the taxes to the inspection of everybody, but this is open to every human being who can read. There is no way to hide it.

Q. (By Mr. A. L. HARRIS.) As this city now is built the land value increases, does it not?—A. Yes.

Q. Who fixes that value; how is that done?—A. Well, there would be one easy thing. You will readily grasp this fact: Having taken out of the question of taxation all possibility of individual discrimination, as I have shown, then every-one will seek to equalize. We will suppose that the population increases the next year 100,000. There would be a proportionate rise in real estate, and that would be equitably assessed. Suppose there were 100,000 people located on the North Side; the advantage of that would accrue, if it were an advantage, to the North Side.

Q. That has to be valued now?—A. It has to be valued now, but it would be done by the entire community with the knowledge that the same system was existing in all parts of the community. There would be no individual discriminations. You have lost the selfish motive. There is no motive in making the North Side pay those taxes; the South Side knows if it has the valuation it too must pay those taxes. In principle and operation the single tax would work justice; you can not discover a place where there is a flaw in its operation.

Q. As this property increases it also increases the burden that is placed upon it for State and other purposes, does it not? A part of those taxes, of course, has to go to defray the expense of running the State?—A. Yes.

Q. We will suppose, now, that you are adjusting this equitably among yourselves; you would be generous enough, would you, to put your values high enough?—A. We have the State board of review now to adjust that.

Q. Would not the imperfections that we are experiencing under our present system—that is, the effort to evade the burden of taxation—come home the same way, on account of the locality that is liable to have a burden to pay attempting to shift it as far as possible and throw it back upon others who are equally anxious to throw it some place else?—A. I should say not, having divested the whole situation now from individual opportunity, as it occurred in the case of Pullman. I am speaking now of the moral factor. You ask if the same elements would not obtain in the matter of assessing a certain section of the State as against the other sections of the State, operating as it does to-day, and I say not, because you would have a common basis for comparison. The law of supply and demand would absolutely obtain under those circumstances.

Q. (By Senator KYLE.) That is supposed to obtain to-day.—A. You know that it does not.

Q. It is supposed to be the governing principle on the board of review in the county and in the State.—A. But don't you see that instantly you confuse the subject by bringing in the value of—

Q. (Interrupting.) There is no doubt about that. You divest it of one great element, the improvements, and what remains is subject to the same imperfections of judgment, and must be.—A. I beg your pardon, it can not be if it is land; it would be if it were buildings.

Q. We find to-day that in two blocks that stand side by side, one man's vacant property will be assessed probably two-thirds higher than the others. At the same time we have a board of review supposed to be good men.—A. I will tell you that if you have the entire community with only one thing to look for, one thing to work upon, you must see that you have simplified the proposition and made a man a direct taxpayer, and when you have done that you have accomplished a thousand other things with it. You can set the wheels of justice to work anywhere. You have accomplished something which relates to everything else. And I say that the simple fact that that map hangs on the wall simplifies the whole thing and makes dishonesty impossible.

Q. I read with much interest here several years ago in the Chicago Times a series of articles some person apparently interested in the welfare of the city had written giving descriptions of property in the center of the city here on State street, worth \$200,000 and \$500,000 for buildings and lots, comparing them with other sections, showing the discriminations and everything else connected with it, and the injustice of it, all published for the benefit of the people of Chicago. I would like to know whether that produced any particular impression upon the city so as to correct the evil?—A. Well, the articles were suggested by myself. A series of articles were written up by Tom Cannon. The immediate effect was to increase the circulation

of the Chicago Times about 6,000 copies a day. It indicated the degree of interest those articles aroused. I remember the Title and Trust Company paid 2 per cent, while a poor fellow who lived out toward the country somewhere paid 27 per cent upon the admitted valuation. I would not say assessed valuation, but the generally expressed valuation in the community. That series of articles was brought out early in 1897. At that time the assessed valuation in Chicago was something like \$77,000,000 less than it was in 1878, when we had about 350,000 population.

Q. (By Mr. CONGER.) Do you know the assessed valuation of Chicago now?—A. No.

Q. (By Senator KYLE.) What would you think of the beneficial effect of a published list of the taxes upon property at the present time?—A. I would not think it would amount to anything, because it would not show anything. We will say you live on State street. Here is a piece of property marked lot 10, block 25. You do not know whether there is a building on lot 10, block 25, and it is doubtful if the next-door neighbor knows much about it. He is probably a renter. He pays, say, \$2,500 a year for his house. You do not know. But if lot 10, block 25, were marked at \$1,250, and lot 10, block 26, were marked \$100, and the taxation was based on the land valuation, you would know mighty quick.

Q. You might not know the relative location?—A. I say lot 10, block 25, and lot 10, block 26; practically the same location. If there were no buildings involved, a perfect stranger from San Francisco could walk through and see there was something wrong there.

Q. You are going on the theory that you would have this published under the single tax?—A. Not at all.

Q. How would you know that this is so?—A. I say these maps would show.

Q. You would have a map hung up in the county treasurer's office?—A. Yes.

Q. Could not that serve now?—A. No.

Q. Why?—A. Because one man would say what kind of buildings it had, and another man would say there was a three-story brick, and it must have cost \$10,000.

Q. Everybody would not know, but somebody would know?—A. Somebody would know, but the public could not know.

Q. The question has arisen in the minds of a great many persons as to whether it is not wise to publish the taxation of property, similarly to the way the Government has thought of publishing the pension lists to purge the lists. A. There might be a little value in that, but I do not believe so.

Q. Now, leaving the question of the single tax just a little bit, and taking it for granted that the Illinois legislature and those of adjacent States here are not going to adopt that system for the next 4 or 5 years, what have you to offer in the way of relief to the farmers for unjust taxation—something that is immediate?—A. It would take a pretty wise man to invent anything that will defeat intentional deceit, perjury, and fraud anywhere, and that is what you are going to have just as long as you have the mixed system of taxation. Now, in saying that I do not doubt that there are certain forms adopted by other States which ameliorate the general condition of things. I have no doubt but what, for instance, the State treasurers or auditors might get together and adopt measures by taking the best plan, as they discover it, in each State and combining them in one form; that would doubtless relieve the situation; but I do not believe you will ever relieve the situation as long as you have mixed taxation. I think it is a human impossibility to do it. And laying aside now all dishonesty and all intentional deceit, putting it out of the question, still I think you will not secure equitable taxation under the present system of mixed taxes. It becomes too confusing; no one mind is capable of grasping the system.

Q. (By Mr. CONGER.) The present system of listing personal property in Chicago is a new system, is it not?—A. Yes.

Q. Do you think it is a good one? Will it be an improvement over the old?—A. Oh, yes; it has increased, as I have shown you, the listing of the property. How the entire system will work I do not know. There will be a legal testing of the power of the board of review. Now the board of review has the power under the law to raise you to a certain figure. That is the present Illinois law. It is a question whether it will stand the test of the constitution.

Q. Regardless of the man's affidavit who lists his property?—A. Oh, yes; entirely. They have raised property millions on the South Side.

Q. (By Mr. A. L. HARRIS.) Have you anything further to say in regard to agricultural conditions or relief?—A. Along that same line, yes. I think the farmer feels to-day that he is the chief sufferer from what is going on in the world through what is known as the trust, the trustification going on; and I think that the same law would settle that question as well as it would settle the question of taxation, by destroying special privileges.

Q. Please explain.—A. The farmer is not satisfied with present conditions; he is not selling his products one penny higher to-day than he did 4 years ago. The condition of agriculture to-day quite generally, I think, felt by the farmers is that they are paying higher prices for everything they buy for the farm, and that they are not getting any more than they received a few years ago to speak of for what they produce, not anything to compare with the rise. So they have a grievance all right. The entire rise in steel does not grow out of the trustification. It grows out of splendid crops, which have made the farmers buyers and increased the demand for manufactured products through the land. I say that the trust would be affected in the same way ultimately by the single tax that your dishonest taxpayer would be—by destroying special privileges. The special privilege always establishes revenues without any regard to the conditions. They may be slightly affected, but relatively they always have large revenues. They are not subject to the law of supply and demand, while individual initiative and enterprise are always subject to the law of supply and demand.

CHICAGO, ILL., August 10, 1899.

TESTIMONY OF MR. EDWARD S. RICHARDS,

Grain merchant, Chicago, Ill.

At a meeting of the subcommission on agriculture in Chicago, Ill., at 10 20 a. m., August 10, 1899, Mr. A. L. Harris presiding, Mr. Edward S. Richards was introduced as a witness, and, on being duly sworn, testified as follows:

Q. (By Senator KYLE.) Please state your full name.—A. Edward S. Richards.

Q. And residence.—A. I live in Chicago.

Q. What is your occupation?—A. My occupation has been that of a commission merchant, grain merchant.

Q. How long have you resided in Chicago?—A. I came here in November, 1868; been here ever since.

Q. Have you been conducting business on your own account during those years, or have you been identified with some elevator systems?—A. Well, I went into the grain business in 1873, and was connected with a receiving house at that time, and continued in that connection until 1878, when I went into business on my own account as a shipper of grain; bought and sold grain by sample on the Chicago Board of Trade. I continued in that business until 1884. I found during that period, as a shipper of grain, that we were having a great deal of trouble about the weights. There were continual claims for shortage being made from our correspondents in the East and South, and those shortages either had to be paid or we had to lose our business. I found upon attempting to collect the shortages from the railroad companies from whom I had received bills of lading and upon which I had paid for this property that they refused to pay any claims for shortages; and the result of it was that I had to pay them myself or lose my business. And I continued then until 1884, I think it was, and then I built a transfer house for the Lake Shore and Michigan Southern Railroad Company, whereby we took the grain out of the cars and weighed it instead of weighing it on track scales, as had been the custom theretofore. I might say in regard to the track scale weighing, that really the method that was employed in those days was, that after a Western car had arrived in Chicago, and the sample had been taken from the car and exposed for sale on the board of trade, and as soon as the grain had been sold the car was ordered over to the Eastern line to be transferred into an Eastern car. This being the terminal of the Western roads, they did not allow their cars to go on east of Chicago; consequently the grain had to be transferred from the Western car to an Eastern car. Well, the first step in that direction was to weigh the Western car to get the gross weight of it. The car was then switched over to what was called the transfer track, and there the grain was shoveled by hand from the Western car into the Eastern car, which involved expensive labor. That was so as late as 1884, and for many years prior to that. After the grain had been taken out of the Western car, which was sometimes as long as 3 weeks afterwards—it was a tedious operation—the empty car was taken back to the track scales from whence it came and there reweighed, and the tare thus ascertained was deducted from the gross weight, which had been previously ascertained, and that was presumed to be the weight of the grain, and upon those weights we paid for it—we bought and sold. And those weights were put in the bill of lading, and we

of course made our invoices to our correspondents, and if the weights held up it was all right, but if they fell short we had no remedy. We had to pay the shortage, as I remarked a little while ago; we could get no redress out of the railroad companies.

Q. That is, your correspondents in the West?—A. No; in the East. Well, the same way in the West. Of course, I being a shipper, my correspondents were in the East. The railroads made it a rule to remit the freight on the excess. For instance, if the weight would fall short 1,000 pounds, and the rate from here to New York was 20 cents a hundred, they would remit \$2, but that would not be for the grain, which was the biggest end of the deal. Then I got up what is called the hopper system of transferring grain. In the first place, we ran the car up on an incline, elevated the car about 30 feet, and then we took steam shovels and got the grain out of the western car into the hopper scale, and then got the net weight, and that weight was always correct and reliable and was adopted as a final weight, and accepted by the trade everywhere, East and West and all over the country, as being satisfactory.

Q. Is that plan still in use?—A. Yes; it is in use in a modified form. I got up another plan. There was an objection to pushing a car up this incline. We had to push it up about 1,000 feet and that was an expense. So I got up another plan of elevating the grain from the grade level. It is practically an elevator apparatus without any storage. I took out the bins and made a cheap affair of it. It did the work all right. It did what we wanted and we paid only for what we needed. In that Lake Shore deal I got 70 cents a car for the certificate of weights. The expense was much less by that way than it was by the other way, both in performing the work and to the trade; and yet the track system is not in use, but the other system is. They are both mine. They both belong to me. I got them both up. Then I got into trouble with the Lake Shore Railroad. They were troubled with the weights down at the eastern end, and they would fall short sometimes as high as—well, one car of oats fell short about 3,000 pounds, and that was the straw that broke the camel's back. I went down there. They would not pay the loss. A man by the name of Hunter owned the oats, and they fell short about 3,000 pounds in New York—about 100 bushels. I went to New York to see about it, but they would not do anything, and the result was that it created a rupture between me and the railroad, and they broke our contract and cut my business off short, so I gave that business up in 1886.

Q. You might tell us something about the importance of Chicago as a grain center, and the growth of the business done here.—A. Well, Chicago by reason of its geographical position, which is a commanding one, has these great systems of railroads coming in and going out, which are distributing lines. We also have the lake, which is another great avenue of transportation, and which should make Chicago naturally a very strong point, provided the rates and the conditions were suitable for them; but our elevator system has all got tangled up here. We stand to-day with an elevator capacity of, I think, about 40,000,000 bushels, and we have not a public warehouse in the city. I mean by that, we have not an elevator that is run in the interests of the people.

Q. The kind prescribed by the law of 1871, you refer to—public elevator?—A. Yes; where a warehouseman is not a dealer. In all these elevators, I think without a single exception, the warehouseman deals in grain, and the grades are so manipulated that it is hard to tell what you are getting when you buy a lot of wheat. Of course, if you want to buy a special quality of grain you can get it, but you have to pay a premium on it. You can not get it on the open market. That is the way I understand it, and for that reason I am inclined to think that the public suffers great injustice and a great wrong.

Q. How many of these terminal elevators are there that are supposed to be public warehouses?—A. I think there are about 28 or 30. They are all run by about seven or eight firms.

Q. And all these men are engaged in buying and selling grain themselves, who are storing grain for the public?—A. Yes.

Q. You might tell us about that and the evils that are growing out of it.—A. Well, you start with the initial shipper. These elevator people have their buyers out in the country to buy grain. They send the quotations out every day to the country shippers along these different lines of railroad, and a bid is made for the farmers' grain. The country shipper buys it and puts it in his warehouse, if he has one. But whenever the farmer sells it to his country shipper, he sells it subject to Chicago weights and inspection. It don't make any difference to say: "Well, he knows how many bushels he puts in the car," because he must sell subject to Chicago weight and inspection. If he falls short 2 or 3 or 5 or 10 cents a bushel in Chicago, that is all his loss; he has no remedy, and he has no receipt from the

railroad that will protect him, because the bill says, "subject to loss in weight," and the terms of the contract prevent the making of any claim.

Q. The same rule applies to inspection as to weights. Do not our farmers generally know pretty nearly what grades they are raising?—A. That is true; our farmers can tell the grades they raise as soon as it shows up in their hands.

Q. (By Mr. CONGER.) Is there much complaint from these country shippers that the weights fall short more frequently than they overrun?—A. We never hear of their overrunning; if they overrun we never hear of it; that is, looking at it from the standpoint of the shipper. Of course, that is one of the perquisites of the business.

Q. Is there considerable complaint about the weights falling short?—A. There has been a very serious complaint in the last few years. I have not been actively engaged in the grain business in the last few years, and I am not able to say what has been the experience more recently.

Q. (By Senator KYLE.) Has there been a general complaint in regard to the inspection, as a rule?—A. I think there has. I gather that from my conversation with men that are in the trade.

Q. (By Mr. CONGER.) Does the fact that these elevator men in Chicago are engaged in the purchase of grain along these lines of railroad operate against the interests of the producers of grain as to price?—A. I think it has some effect; just to what extent I could not say. The farmer raises grain, and as soon as he harvests it he must sell it, in the great majority of cases, and he must accept the situation, whatever it may be. He has no facilities for keeping the grain, and he has to dispose of it. Of course, that is sometimes partly for his financial interest, and sometimes possibly he has no facilities for holding it.

Q. (By Senator KYLE.) The reason the grain men are interested is because it goes into the hands of what is called the terminal elevators; that is, these Class A men?—A. Yes.

Q. Is there a combination amongst these men to control the grain business in this city?—A. I think there is.

Q. Tell us what you know about that; go as fully into that question as you can from your knowledge.—A. I could not say that there is a combination to the extent of dividing their earnings or pooling their business or anything of that sort. I am rather inclined to think that there is not, but I think there is an understanding between them as to what the rates of storage shall be, and upon what lines the inspection shall be made, and in fact all of the general details of the business, I think. I think so far as the management of the business is concerned it is done by this combination of elevators.

Q. Do the railroads direct that the grain hauled upon their respective roads shall be consigned to these terminal elevators, the ones upon their own roads, respectively?—A. I think that is a condition that naturally follows. If the grain were coming in on the St. Paul road it would naturally come into the elevators on that line. I do not mean to say that if the owner of a lot of grain shipped it here over the St. Paul and wanted to have it sent over perhaps to the Chicago and Alton that they would not switch that car. I do not know whether there is any restriction of that kind that would prevent that, but naturally the grain would go into the elevator on the line belonging to the railroad that transports the grain.

Q. Who owns these elevators?—A. With a few exceptions, the railroads own them.

Q. And are operated by themselves or leased principally?—A. No; I understand that they are leased.

Q. Are special favors ever given to the lessees?—A. I think so; yes. I have been informed—I state this simply from hearsay—that the plan has been on the part of the railroads to let a person or firm take an elevator and run it, and they pay them so much per car for all grain that goes through the house; that that is the basis upon which the rental is fixed. Of course, the inference is, and I think it is generally believed, that parties occupying that relation with the railroad company get special favors in the way of rebates or concessions that perhaps do not belong to them. I think one of our great troubles of the day is that all shippers are not treated alike.

Q. You said a moment ago that these terminal elevators were buying grain themselves, and at the same time they were supposed to be public warehouses. If I consign a carload of grain from Minnesota to one of your elevators of the Milwaukee and St. Paul road it must be received by these men?—A. Yes.

Q. The bills are examined by these men; in other words, all your waybills are open to the inspection of those who are your natural rivals in business? They know how your car is consigned if you ship out of here, and they know the grade of your wheat, and all those things?—A. Oh, yes; they know that.

Q. They also get the knowledge of all the men who are shipping grain here?—A. Yes; they know that. You are obliged to give up that information. For instance, if you want to get a lot of grain out of an elevator, you go and get an order from the elevator to deliver that car of grain to an Eastern road, the Lake Shore and Michigan Southern, or any of those roads, and it is quite frequently the case that the name of the consignee is on this notice, and the shipping directions. In that way an elevator man would get possession of information that perhaps you would not prefer to give up. There may be a way of evading that. I do not see how. These conditions have come up since I went out of business; so I do not want to be quoted as absolute there, but think it is right.

Q. Is it true that there are two or three private elevator companies in Illinois—the Illinois Grain Dealers' Association, for instance, which has a number of members, and is composed of the small country elevators through the State of Illinois—that are rather in competition with these men who are operating the elevators of Class A?—A. That is right. The Illinois Grain Dealers' Association is another combination. It is different from this one; it has no relation to it. As you say, it is in competition with them.

Q. We understand that the members of this association contend that, as independent buyers, all their business is subject to the inspection of their competitors in Class A?—A. Oh, yes; I do not think there is any question about that.

Q. They know from whom the grain is shipped, to whom it is consigned, the grade, and all about it, and so have the very ins and outs, so to speak, of their private business?—A. Yes; the railroad companies, when they ship a carload of grain from an initial point, or any point, make in addition to their waybills that you speak of an expense bill. That expense bill is what determines the freight that the receiving road has against it. For example, if I ship a carload of grain from Des Moines, Iowa, to Chicago, over the Rock Island Railroad, that carries with it the charges from Des Moines to Chicago, which belong to the Rock Island Railroad, and they are carried out on that expense bill. That expense bill then is turned over. The car is being shipped, and we will assume now that it is turned over to the Eastern line with directions to collect the back charges from the consignee in New York or wherever the grain may be carried, \$78; that is, on the Rock Island Railroad, and the Eastern railroad assumes to pay that much to the Western railroad, so that expense bill comes to Chicago and is collected by these elevators here, I suppose. The expense bill is paid by the consignee in Chicago, which would be, we will say, one of these elevator men. Then that leads into a situation where I think you are going to find some good meat as to where these rebates come from, and how they are paid.

Q. You believe there are systems of rebates in operation?—A. Yes. It is done through these expense bills. That is one way they do it, and I do not know but what they may have other ways.

Q. Explain the rebate matter a little more fully.—A. My opinion is that the consignee in Chicago—say he is one of our elevator friends here, for example—gets a lot of grain over the line of railroad on which his property is located, and he pays the regular tariff. The expense bill comes in and he pays it and gets a receipt for it. At the end of the month he makes up a statement of the amount of grain that he has received over that railroad. He sends that in to the company, to some officer—nobody knows exactly who he is—and the rebate is figured out, so much per 100 pounds, or whatever they have agreed to give him. Now, that money does not come to him out of the freight department. You might go in the freight department and hunt for it for a half a year and you never would find it; but my information is that it is paid by some other department. It is charged up to some other fund—it may be the bridge fund, the repair fund, the passenger fund, or some other fund—and you could not find it in any of the cracks where you would think it would be lost.

Q. And you think this favor is only granted to the operators or the lessees of the terminal elevators?—A. Substantially so; yes. I do not believe that any shipper of the road has that advantage. It used to be, in old times, that everybody got a little rake-off; but when this interstate-commerce law came in it was hailed with a good deal of pleasure by the railroads, because it simplified their business. They thought it would be a good deal better to give a rebate to one man than it would be to give it to 100 or 500, because then they knew just how to handle it. Our lines are operated by such men as Mr. Peay, Mr. Counsellman, Mr. Armour, and Carrington, Hanna & Co.

Q. Does this operate, in your judgment, to the detriment or depression of the grain trade in any way?—A. I think most assuredly it does.

Q. How, in your opinion?—A. Well, it is discrimination. It gives to one man an advantage that another does not have; consequently they are not upon the same footing, and they can not do business upon the same lines.

Q. I refer to the price of grain, as realized by the agriculturists of the country.—
A. I can not see how the agriculturists would be benefited by it in any way. The way they got at this thing in the first place was a good deal like these beef fellows did. They would go into a station where a man had been in the grain business perhaps all his life, been identified with the town as long as it had been a town, as a grain dealer, and stood well in the community, and had bought grain of the farmers, and whose dealings were all satisfactory; and these elevator men would go out there and try to do business with him. Well, they could not do it, and it was not satisfactory, and they would say: "All right; if you don't sell us this grain we will put a man in ourselves." They would put a man in and start in by bidding up a little and paying the farmer a quarter of a cent or half a cent or 2 cents, no difference what it was, and they would do that until they got the other fellow out—the old citizen had to go. Then the other fellow was in and he worked things just to suit himself. Then the question is, How far did he go the other way? Nobody knows, because there was nobody there to watch him. The farmers felt that they were not getting what they were entitled to. They could not tell exactly how nor why, but they were not satisfied. They would have to sell the grain subject to those conditions, and they were not always satisfied.

Q. In the Northwest there are about three elevator systems, as a rule, in the important towns. Do you suppose there is collusion between them as to the carrying price of grain?—A. Well, now, for example, I see Mr. Peavey has gone to work and bought \$300,000 or \$400,000 worth of elevators along the line of the railroads. It is just exactly as if it was in Duluth; it is all along the same system, just like the telegraph company is. It fixes the rate, and they do the business on this line.

Q. We have three systems that operate through the Northwest, through South and North Dakota and Montana. They are F. H. Peavey & Co., Van Dusen system, and Bagley & Cargill. Though the three companies may be buying grain and acting as ostensible rivals in the community, at the same time is there not practically but one elevator system in the town?—A. Well, I do not know as to that. I am not acquainted with that situation.

Q. The agriculturists who had been buying and selling grain have been crowded out of the market by these people, and they now have possession and are operating in the town as elevator men. It is charged that the card price is arranged in the East and sent to the West each day, and that there is practically but one man in the field buying grain; that the farmer may choose to sell his grain on only one card; that it goes on to the East as his shipment, and at the same time it must ultimately fall into the hands of those who are his natural enemies.—A. That is it. There is a point right there that we want to look at a little. For instance, we will take No. 2 wheat. There is the line. We carry the grade. I think if it weighs 56 pounds to the measured bushel and is reasonably clean it will grade No. 2. If it weighs 63 pounds under the same conditions, it grades No. 2. Now, intrinsically, there is a difference in the value of that wheat amounting, perhaps, if a miller looks at it, to 5, 6, or 10 cents a bushel. Now, here comes one of our friends from the Northwest, the farmer. He has a specially nice lot of wheat to ship to Chicago. It weighs 63 pounds. It goes to the elevator: it is graded as No. 2 wheat. He might have a lot of that cheap wheat, and may have some very good No. 3 wheat that he wants to raise to No. 2. He can take 2 cars of No. 2 wheat and 3 cars of No. 3 wheat—the difference ranges as high as 15 cents a bushel—and make 5 cars of No. 2 wheat at a time.

Q. Raise 15 cents a bushel on 3 cars?—A. Yes. Now, there is where we do not think we get a fair deal. If we have a fine lot of grain that is put into the elevator, we want to know that we are going to get the same kind of grain. We do not always get it, and that is one of the defects in our grading system that we cannot overcome; and that is why I say we ought to pay more attention to the selling of grain by sample. Where a man wants grain for consumption he wants to get what he buys and what he pays for, just as when you buy a suit of clothes you select a piece of cloth for those garments and you want the same piece of cloth that you buy.

Q. You have no remedy to suggest?—A. Only selling by sample; that is the only way I can see. We want to preserve the identity of the article. If you take that fine wheat you have up in your country and deliver that identical grain in Liverpool you will get 15 cents a bushel more. They have good mills over there, but they can not get the wheat to make the flour.

Q. The evil seems to be in the inspection department?—A. That is one of the evils. I do not see how you are going to get over it.

Q. The grain is inspected under State rules?—A. You can not make a rule for every carload of wheat. There must be a line upon which you go. You have a minimum quality and a maximum quality.

Q. There is a chance for improvement in both the State and national laws, you think?—A. I would be a little wary about attempting to fool with the inspection department unless you do it to correct fraud. If you can find a place where there is fraud going on, then of course you must apply the remedy; but I do not see that there is any fraud here, except so far as the warehouseman may perpetrate fraud by taking advantage of your good wheat to raise his poor wheat. That is one of the defects of the system.

Q. What does your law provide in regard to such a matter as that?—A. It does not provide anything, because they are both No. 2 wheat, and the law provides that they shall go into the same bin, but he don't put them in the same bin. He puts his low-grade wheat into the same bin and all his high-grade wheat into another—that is, we presume he does—but he is not violating the law when he does it.

Q. Your statement in regard to special favors in the way of rebates, etc., brings this question very close to the interstate-commerce matter. Do you know whether the Interstate Commerce Commission has been here to investigate that matter?—A. I have seen some notice in the papers that they have been here, but I have not paid any attention to it and have not attended any of their meetings.

Q. Is it a violation of the interstate-commerce law?—A. Well, I never looked at the law as amounting to anything. I think everything they attempt to do is a kind of farce. It stands as a kind of club if the railroad company will not give a man a pass.

Q. Now, that leads up to the consideration of the interstate-commerce law. You can tell us what you know about that law and its workings from your observation and experience up to the present time.

(A letter written by Mr. Richards to Senator Kyle, dated Chicago, Ill., July 11, 1899, was here submitted as containing the witness's views on the subject of the interstate-commerce law. Said letter follows:)

2008 JACKSON BOULEVARD,
Chicago, Ill., July 11, 1899.

HON. JAMES H. KYLE,
Chairman Industrial Commission, Washington, D. C.

DEAR SIR: I have the honor to inclose herewith a letter of introduction from my esteemed friend, Hon. Shelby M. Cullom, of the United States Senate.

Knowing that in all probability matters of great importance to the public will be brought before the Fifty-sixth Congress that are or will be considered by your commission, I have sought an opportunity to give expression to certain views I hold in regard to what I consider important factors to the welfare and prosperity of the country at large, and which are embodied in the two questions of interstate commerce and capital and labor, both vital forces in our political, social, and domestic economy, and with which I have had a close and intimate relation for many years past through practical business association.

Since the year 1873, and until within the past few years, I have been personally and actively identified with the purchase, sale, and shipment of grain in the Northwest, in which capacity I have met the abstract principles surrounding the transportation problems, and have experienced and made a study of the causes and effects of strikes and dissensions between capital and labor, both of which are, in my judgment, not only the most important factors in our commercial relations, but, under certain conditions ones from which emanate the most violent disturbances and disruptions to our business interests, clearly showing that we have reached a point in both of these great and important questions where wise and just legislation is the only remedy for the evils that have long been a menace to our national and individual prosperity.

My conclusions may be stated as follows:

First. That Congress alone has the power to enact laws that will protect, regulate, and enhance all kinds of interstate business.

Second. That the power vested in the Interstate Commerce Commissioners should be so extended as to give them such judicial or police powers over transportation companies as will enable them to enforce all laws in a manner not in conflict with the local laws in the States in which said companies may operate or have a corporate existence.

Third. That the interstate-commerce law in its present form is incomplete and inadequate to perform the uses and functions for which it was originally intended, and should be amended to that point or repealed entirely.

Fourth. That the stability of a rate is more important than the rate itself. All rates should be uniform and should be based upon single carloads as the unit, without regard to volume, and no discrimination or preference allowed between

shippers, all rates being flat, without concession or rebate, and so stated in the bills of lading issued upon grain or other merchandise shipped from one State to another.

Fifth. That practically 90 per cent of all grain and farm products raised in the United States becomes an element of interstate traffic, and that the Interstate Commerce Commission should be clothed with supervisory power to direct, control, and enforce every minute detail connected with transportation—weighing, storage and inspection, transfer en route from one line to another from the original point of shipment to its destination—not inconsistent with the State laws for the protection of the parties interested in said property.

Sixth. That all bills of lading now issued by railroad transportation lines covering grain shipments are illegal, and in many instances are used to perpetrate and conceal fraud and dishonesty.

Seventh. That the grain business of the United States represents one of its most important industries, and that millions upon millions of dollars are lost annually to owners and shippers by reason of defective bills of lading and other wrong and illegal methods employed by intermediate agencies between the producer and consumer. These can only be stopped or mitigated by proper national legislation.

I have given, in a cursory manner, what I consider some of the salient principles and requirements of an interstate-commerce law. I have worked out some details for a bill that may be submitted at another time, if desired. This subject, being an extensive one, demands the closest and most careful consideration. An effort will doubtless be made in the next Congress to enact amendments to the existing law that will permit pooling. The courts, both State and Federal, have generally defined the character of traffic associations and their relations to the public. In my judgment, the present law has been inoculated with vicious provisions that have impaired its value and destroyed its efficiency as a protective measure to the best interests of the people. Care should be taken to scrupulously guard against all kinds of subterfuges that may be employed to controvert and destroy any of the rights that have been decreed as belonging to the people by the judicial department of our Government. This can only be subverted by wise and judicious legislation that is unmistakably plain in its language and purpose. In this the present law appears to be most defective and weak. It neither confers the requisite powers upon the commissioners nor reaches the foundation of the practical wrongs it was intended to correct.

Touching the capital and labor question, my observation, taken from an impartial standpoint, has taught me that wrong exists on both sides. From these, differences have arisen that have crystallized into dissensions that breed strikes and violent opposition one to the other. This condition is unnatural and destroys more than it builds, and is as demoralizing as it is destructive. As a remedy for this I believe in organization, without which desirable results can not be obtained. But in making these organizations the power of the State must be invoked. The working of capital is largely through chartered corporate channels, defined and prescribed by law. The working of labor is through organizations that have no legal entity outside of a dispensation of its own creation. I know of no labor organization that is operated by a charter obtained through the laws of the State. If these are true conditions, we have organized capital versus disorganized labor. Both, in my opinion, should be upon the same footing.

Labor is as much a commodity as corn, dry goods, insurance, all of which have a commercial value and are bought and sold in the markets of the world. The law of supply and demand is the natural arbiter of values. All attempts to force aside this law by creating fictitious values in stocks, grain, or labor breeds disaster against which there are statutory laws.

During the last quarter of a century the times and conditions have most radically changed. Old things have been supplemented by new ones. There appears to have been a revulsion from the time-honored maxim that "Competition is the life of trade" to the dogma that is inscribed upon the banners of both capital and labor, "Death to competition." You will see the effect of this in our so-called "trusts" that are springing up in giant form and including all necessities of life, such as tobacco, sugar, iron, road carriers, house servants, etc. In this new departure capital and labor appear to be neck and neck in the race.

Our courts have decreed against and denounced the principles upon which these "trusts" are formed, but they still go on with the work. Strikes and rumors of strikes are heard all over the country, and a new trust is born almost every hour. At this juncture, in my opinion, lies the great work of your commission. Wise legislation is the only means that will reach and reconcile these differences. The power of the Government is all-powerful, to which all are subservient. There is a grave doubt as to the jurisdiction of Congress in legislating against trusts created

and operated under State authority, but its complexion changes when they undertake to do business with territory outside of their parent State, as in the case of transportation companies, whose ramifications are so wide and far reaching that they must come within the control of Congress; hence, if a strike should occur upon the Chicago, Burlington and Quincy Railroad, that runs through several States, and it being engaged in handling interstate traffic, it would appear that the entire question would come as clearly under governmental control as in the transportation of the United States mail or other Government property. If the question of jurisdiction can be disposed of, the remedy appears simple, and my suggestions are as follows:

First. That Congress enact a law authorizing labor organizations to be created under special enactment or charter privileges, with as many subordinate classified branches as it may require; this to be a department of the Government, the same as in patents, pensions, or agriculture.

Second. That it shall be the privilege and duty of all persons who may think that it is to their interest to join a labor organization to become members of it and to abide by the laws and regulations that govern it.

Third. That no individual or organization not acting under the law shall have any legal existence for remedy or redress for any grievance except through the lawful organization of which they are members in good standing.

Fourth. It shall be the duty of every subordinate organization to hear and consider any complaint filed by any of its members and to act on the same, and provision should be made for bringing in all parties to a controversy before a decision is made or an appeal is taken.

I have, I think, sufficiently outlined my suggestions to give you a general idea of how I propose to reach these questions. I have given both subjects careful study, and have blocked out a bill that covers more in detail the line of my thoughts and researches.

If the above suggestions are of any interest, I shall be glad to hear from you further, and will render such aid as in my power.

Yours, respectfully,

EDWARD S. RICHARDS.

Q. Please give your judgment as to the operations of the interstate-commerce law up to the present time, as observed by yourself in your practical experience and contact with it.—A. My idea about the interstate-commerce law is that it was prompted by the conditions that existed at the time Congress was asked to act in the matter, to prevent discriminations against persons or individuals, realizing the fact that a railroad system is a country maker or a country ruiner—you know they can build the country or they can destroy it, they can build an individual or they can destroy him, by their policy of discrimination. As I understand it, this law was passed for the purpose alone of preventing that discrimination, so as to put every man who was in business on an equal footing. But in passing that law Congress was led to apply certain remedies that the courts have not recognized; in other words, they were unconstitutional. They can not compel a man, as the Constitution has provided, to say nothing about the courts, to testify against himself. That was one of the provisions in this law that weakened it, in my judgment. We had that experience in the Counselman case. The result of it was that this long line of testimony that was available or could have been made available had that fault never existed in the law, might have been drawn out; but they did not do it. They did not get it. Then they sought to amend the law by relieving a person of any criminality, and how far that has operated I do not know, because I do not believe there have been any cases. The questions of discriminations in the long and the short haul have been aggravating because they have been perplexing. We have not been able to determine exactly how that should be applied. That was just exactly what they wanted. They wanted all those perplexing questions to come in there, so when the issue was made there would be no way to meet it. My theory about this whole law business is that what we want to do is to get down to practical results and to practical conditions. Take a car load of grain, for example, as a basis and follow it right through and see what the ramifications are that it has to pass through, and set your machine to fit the case. You can not change it. As I understand it, the law must be applied to the actual conditions as they exist. These people are just simply the agents of each other; we are agents of each other, and we are dependent upon each other. So far as we have good faith with each other we get along, and when we do not we have trouble.

Q. The operations of the interstate commerce law during the past few years you do not think have been very satisfactory to the people?—A. Not at all; the people have had no confidence in it.

Q. What do you regard as its imperfections chiefly?—A. I think, in the first place, that the commissioners have no authority to act and do anything. If we file our complaint with the commissioners, the amount of it would be that they would look it over and give it a cursory examination and say, "We think very likely there may be a case; you would better take it to the United States attorney and give him the case." And that does no good. A man can not spend his lifetime fighting these things. There ought to be a more summary way of running these things than we have now.

Q. (By Mr. CONGER.) In stating your conclusions in your statement, you say that "The power vested in the Interstate Commerce Commissioners should be so extended as to give them such judicial or police powers over transportation companies as will enable them to enforce all laws in a manner not in conflict with the local laws in the States in which said companies may operate or have a corporate existence." Would you enlarge on that point a little?—A. The question of giving them judicial power seems to be a pretty serious one. I am told that the courts do not favor that. The Supreme Court has not favored it. But I have not heard that there was any objection to giving them police powers, which is nothing more nor less than the enforcement of the laws of the States through which this grain passes. For example, if you have a carload of grain coming from Minnesota or Dakota to Chicago, while it is here it must be subservient to the laws of this State, and I do not understand that Congress can interfere with those matters. Those conditions must be carried out. Hence, if the commission were clothed with the power to enforce even the laws of the State, which we think are good and are competent to manage those questions, that would be an improvement on what we have now, even if they can not have the judicial power to impose a fine and punish the parties who violate the law.

Q. Your fourth conclusion is that the stability of a rate is more important than the rate itself. Touching on that point, I noticed in the papers the other day that Mr. Knapp, of the Interstate Commerce Commission, and, I think, Mr. Morton, a local merchant or shipper, both expressed themselves as in favor of legalized pooling. What would be your idea in regard to that?—A. I think it would hardly pay to legalize it. We have a pool now. This traffic association is nothing more than a pool, and they have been doing business exactly on the same line as they always have. The courts have sat down on them, but they keep on just the same. The pooling business is simply an understanding between themselves as to the division of the tonnage and the making of the rates and the percentages, etc. That is about all that amounts to.

Q. At present it is prohibited by law, is it not?—A. I think it is. I have not read the decisions of the Supreme Court on that point. I just glanced them over, and generally they do not approve of the methods of the association.

Q. I think the idea as expressed by these gentlemen was that it should be made legal for roads competing for business from a given point to divide that business and each road carry its proportion at a fixed rate rather than to be cutting rates to a disastrously low point, the theory being that they now cut the rates to those competing points to such an extent that they carry the business at a loss and are obliged to get their profit by charging higher rates from noncompetitive points.—A. Well, that all comes in under this doctrine of competition. If we must abandon the theory that competition is the life of trade and is the germ on which business is built up, then, of course, the pooling business is all right. I know that in my experience, even before this pooling business was adopted, I have known where railroads have done business at a loss, and I think that is an unfortunate condition.

Q. (By Senator KYLE.) Isn't it rather a choice between two evils? Pooling exists in practice at the present time, and there is no supervision by the Interstate Commerce Commission; but, under the new plan suggested by Mr. Knapp, he would allow them to pool the business and have them under the supervision of the Interstate Commerce Commission.—A. It would depend on how it is legalized. If there is a barbed-wire fence, so that you can hold them in, it is all right, but if not, you will have the same trouble that you have now.

Q. The contention of the railroad companies is this: In one of our Western towns where there are 3 or 4 or 5 railroads entering, the jobbers, that is, the large dealers, have the railroad companies practically by the throat. They say, "Here, give us rebates, and cut rates down to one-half or one-third, or whatever it is." And they are compelled to do it, or they will ship on some other road; and consequently, in order to meet a deficit in the treasury, they must in turn take the small shipper by the throat and hold him up, and recoup themselves in that way. But they claim that if the law permitted pooling they would take the jobber by the throat and say, "Stand and deliver, and we will be fair to the small shippers."—A. Of course, if you can enforce that doctrine, it is all right. That is

where the trouble is going to be. We all like to buy things as cheaply as we can get them. I guess it is human nature. Mr. Armour is a large shipper of provisions and grain, and, of course, when he has a good big lot of freight the railroads know it, and they come and make him a bid for it. One fellow will come in and say, "I will take that for 23 cents," and he will say, "Come in and see us again." Another fellow will come in and take it for 24 cents, and the result is that he gets it. I do not know that Mr. Armour ought to be punished because he gets it as cheap as he can—that is, cheaper than some other fellow could get it. That seems to be his privilege. But it seems to me that as long as the railroads are operated as they are, for the benefit of the whole public, the little man should be protected as much as the big one, and the railroads should be absolutely prohibited from giving special rates to one man over another. If that can be done and placed under the supervision of the Interstate Commerce Commission, with power to punish, and enforce that law under penalties, that might make pooling successful.

Q. You say pooling exists, has existed in the past, and the probability is it will exist in the future?—A. In some form or another. I am satisfied we have just as much of a pool as we ever had. I do not think its methods of doing business have been changed by these decisions of the Supreme Court. They may be a little more cautious in doing their business, but I have no reason to believe their methods have been materially changed.

Q. (By Mr. A. L. HARRIS.) Can Congress give to the Interstate Commerce Commission, subject, of course, to appeal to the higher courts, this power? Is there anything to prevent that, outside of the jealousy of the courts?—A. My suggestion came rather as a hint from Senator Cullom. I was talking with him about that one day, and he said he did not think it would be practicable to give the commission judicial power; that the courts had set their faces rather against it. Whether or not it is an insurmountable question, I do not know.

Q. Is it your idea that it would not be final jurisdiction, but be subject to appeal to the higher courts; and, further, that one of the weak places in the Interstate Commerce Commission is their lack of power to enforce their own findings, and that every finding must stand by itself and is not made a rule of action?—A. That is right; that is just the way it is, I think.

Q. (By Senator KYLE.) Nothing they do is any precedent for future action?—A. That is just what I thought it always was; that it has never had any force to it; carried no weight with it; everything they would say and do seemed to drop like a wet rag and never move.

Q. (By Mr. A. L. HARRIS.) Do you think that when a law is proposed and there is opposition, the first course of the opposition is to defeat the bill, and if that can not be done, the next thing is to clip its wings as much as possible?—A. Exactly; that is what I think has been done. I think there has been more importance attached to this rate business than anything would justify. If the laws of trade could be carried out, that is, competition—because the law of supply and demand must come in as a factor in some way or another, and the very minute you put an iron band around that situation you circumscribe something that ought not to be circumscribed—the question of rates would regulate itself. But I do not know how you are going to accomplish it by pooling, because you virtually give them a band to put around. We must have railroads, and they are all trying to make money, and if they can not get what they consider their share of the business at the regular rates they will cut them, and they will cut anyhow; no matter how strong their agreements are, they cut just the same.

Q. You think the producer and the consumer get more benefit from the fixed rate than they do from a rate which is cut, because in the latter case the producer does not know, and even the buyer may not know, as a rule, what he may have to pay if he gets a product on the market?—A. That is the trouble. I think it all depends upon the stability more than on the rate itself.

Q. (By Senator KYLE.) You might just go into that a little more—the importance of a fixed or stable rate.—A. If people doing business with railroads knew that the rate was uniform, they could make some calculations upon which they could do their business, otherwise they can not. Now, for example, I ship a carload of corn or wheat from here to New York. I buy it right here on the Chicago Board of Trade. I stand right alongside of my competitor. We both buy wheat at the same time and possibly of the same man, pay the same price, and ship it over the same or a competing line of railroad. That wheat gets into New York on the same day. It is sold on the Produce Exchange perhaps by the same broker, and yet one of us can sell cheaper than the other. The conditions are exactly the same; it is bought at the same time and shipped at the same time and the circumstances of the sale are identical, and yet he can undersell me 2 cents a bushel. The result is that a change comes in the market, and my wheat is not sold, and I

nave to pay the expenses. There is a case where one man has been discriminated against. You see the effect of it.

Q. (By Mr. A. L. HARRIS.) Is that practiced now as much by the railroads as in former years?—A. I think it is more so, from the fact that it is driving these fellows out of business. Analyze this board of trade situation. Men that made big money here a few years ago are practically doing nothing now. They have been driven out just the same as the countrymen. Those same conditions are found here in this city, practically.

Q. (By Senator KYLE.) You say the conditions are practically the same?—A. Yes; I mean the man in the country who was the original shipper that I talked about, has been supplanted by the representative of the elevator.

Q. (By Mr. A. L. HARRIS.) Has selling by sample been supplanted by this system?—A. Largely so.

Q. The quality of grain that the seller owns does not count for as much?—A. No.

Q. If it comes within the grade, that is all that is necessary?—A. We believe that we have lost our grip here in the grain market. The grain is going around us. I do not know that that could be backed up by any evidence—that feeling—or if there are any statistics or books which show that up very fairly, but they say we are losing lots of grain; we are not getting it; and the same way with the lumber business. We had trouble here about the inspection of lumber years ago, and parties would not come here, and our grain business is going the same way. The fellow in Boston, instead of coming here, will go out in Iowa and get his grain there.

Q. Is the amount shipped lessening every year?—A. I would not state authoritatively, but I am inclined to think so. I have not been watching it in the last 3 or 4 years.

Q. (By Senator KYLE.) You state in your first conclusion, "That Congress alone has the power to enact laws that will protect, regulate, and enhance all kinds of interstate business." Now, suppose our shippers out in the Northwest consign grain to Chicago, and the rate is between 15 and 20 cents a hundred, and they think they are paying too much, can there be any power added to the Interstate Commerce Commission to regulate that in any way?—A. I do not know whether their province should go so far as to make the rates, because that would be an arbitrary act, which would perhaps be just as distasteful as an arbitrary act on the other side. There is a provision in the law giving the Interstate Commerce Commissioners power in regard to some mechanical devices that are used in the coupling of cars—to make the business interchangeable between different kinds of railroads and between different systems of railroads, so as to have a uniform system of coupling that the cars might be continued right on. But that is not the policy of the railroads, because they do not like to have their cars run off their own lines. The Interstate Commerce Commission could be clothed, I suppose with power to do anything that would facilitate and promote interstate-commerce business.

Q. Suppose our people are paying a charge of 18 or 20 cents a hundred and think that that is an exorbitant price; have they any redress at present?—A. No.

Q. Could the commission be empowered to sit in judgment on those rates and reduce or advance them?—A. I don't think they could. I think when you attempt to fix values by legislation you are stepping into deep water. You can not do it. That is a commercial necessity which the law of supply and demand must cover. I do not believe the rate-making power should be given to the commission, and I do not believe it ought to be given exclusively to the railroads.

Q. (By Mr. A. L. HARRIS.) Where should it rest?—A. Well, the conditions will regulate it. Now, the railroads themselves will announce that they will make a rate, say, of 20 cents between two points. The Government will say, All right; 20 cents is the rate; it shall not be changed under any conditions except as the law does now; and when the rate is 20 cents, it must be the same to Smith, to Brown, and to Jones.

Q. (By Senator KYLE.) And that power is in Congress?—A. Yes. It must be uniform.

Q. Then there must be something about raising the rate?—A. Let the commission decide. That is where the commission does not come in now. In the first place, the bill of lading is ambiguous; it destroys the effect of the law. You have no basis to go on. Then they have a clause in the contract where they absolutely evade that liability and say they are not liable, when the law says they are.

Q. (By Mr. A. L. HARRIS.) The courts enforce that?—A. I do not know whether it has ever been fought out.

(The testimony here closed.)

At a meeting of the subcommission, on August 11, 1899, Mr. Richards was recalled for further examination, and testified as follows:

The WITNESS. Yesterday I wanted to have here a bill of lading such as is used by the transportation lines, to sustain the statement I made that they are illegal, which I calculate to prove or attempt to prove by the statutes of Illinois, which I think are in accord with the law governing common carriers which pertains to the whole country. I have here the compiled statutes of the State relating to the railroad and warehouse laws. It is gotten up by the State Board of Railroad and Warehouse Commissioners. (Reading.) An act regulating the receiving, transportation and delivery of grain by railroad corporations, and defining the duties of such corporations with respect thereto. [Approved April 25, 1871. In force July 1, 1871. P. 636.] Section 118. "*Be it enacted by the people of the State of Illinois represented in the general assembly*. That every railroad corporation, chartered by or organized under the laws of this State or doing business within the limits of the same, when desired by any person wishing to ship any grain over its road, shall receive and transport such grain in bulk, within a reasonable time, and load the same either upon its track, at its depot, or in any warehouse adjoining its track or side track, without distinction, discrimination, or favor between one shipper and another and without distinction or discrimination as to the manner in which such grain is offered to it for transportation, or as to the person, warehouse, or place to whom or to which it may be consigned."

Here comes in where the bill of lading figures (reading):

"Weighing in—receipt. And at the time such grain is received by it for transportation, such corporation shall carefully and correctly weigh the same and issue to the shipper thereof a receipt or bill of lading for such grain, in which shall be stated the true and correct weight."

Now we will take the bill of lading. Here is the bill of lading, the form of which prescribes the name or marks, the name of the consignee, and the destination and description of the articles, which would be 1 carload of grain; and the weight which the law requires should be actually stated is put under a column which says, "Weight, subject to correction;" some bills of lading have it, "Said to contain so many pounds;" but in either case the weight given is ambiguous; it does not mean anything, for the reason that if there is a shortage on that shipment and you attempt to collect that shortage—what evidence have you that it is a shortage? because the railroad states that property is taken on the condition that it may be so much or estimated to be so much; they do not state specifically what it is, and they reserve the right to correct this statement at what they see fit, and then deliver the property at the elevator in which they may be interested. My experience has been that they have fallen short on an average 3 or 4 bushels on a car, and they have gone as high as 100, but that is an uncommon case; but it is not uncommon to have them fall short 20 or 25 bushels.

Q. (By Senator KYLE.) They are always weighed at the initial point?—A. Yes; they are supposed to be weighed at initial points. There are many cases where the facilities do not exist for weighing grain properly. There are some country stations to which the farmers have to haul the grain and weigh it on the wagon scale of the shipper, and they will shovel it from the wagon into the car, and the sum total of these weight tickets of shipments which are made by the shipper are added together as an approximation and inserted into the bill of lading which they give; but that bill of lading given in the country is simply a memorandum, because they do not assume to know, or they say they do not know, what the weight is until it reaches some point of transfer; it may be Chicago or it may be Boston; and they will settle upon terminal weights, whatever they are. Now those weights are, in a majority of cases, determined in Chicago. As I stated yesterday, grain is bought upon Chicago weights and inspection, and whatever the weights are here governs the man in the country, and he sells his property and the payment is made upon that weight; and the same going east. The same weight is taken and used in the former shipments. Well, in case of loss, all that you have is this document, and you can see that it does not amount to very much. There is a clause on this bill which is also objectionable, I think. (Reading from a blank bill of lading of Lake Shore and Michigan Southern Railway Company, marked Exhibit C.) "Grain in bulk consigned to a point where there is an elevator may (unless otherwise expressly noted herein, and then if it is not promptly unloaded) be there delivered and placed with other grain of same kind, without respect to ownership, and if so delivered shall be subject to a lien for elevator charges in addition to all other charges hereunder. No carrier shall be liable for differences in weights or for shrinkage of any grain or seed carried in bulk." Now there is an express declaration on the part of the railroad company that they will not be liable for any shortage, and they do not state here what the basis of that claim shall be definitely. So

that if I ship 30,000 pounds of grain in a car and take that bill of lading, and if they say there is only 27,000 or 29,000 pounds I must accept their statement as final, because I have accepted a contract that virtually admits that. Hence, I say, the bills of lading are not legal, not in compliance with the law.

Q. Has public complaint been made in regard to that?—A. I do not think it has. It is a matter that I have called attention to a number of times. I called the attention, several years ago, of the president of the Board of Trade to it, but at that time they were very much occupied in killing off these bucket shops and they did not think it was of enough importance to look after, and it never has been done that I know of.

Now, as I remarked yesterday, a man that is shipping grain over a railroad line is very careful not to do anything to provoke them. He has to keep good-humored all the time; if he does not he is going to get himself into trouble. Hence these shippers never go to the extent of instituting any legal proceedings to protect their rights, for in the first place it costs money and costs time, and it also aggravates the railroads, and they don't want to do that. Take all the difficulty that comes up there—it just simply passes by; nothing is ever done with it. Hence, I say, I don't think any suits have ever been brought. I do not believe it has ever been brought into court. If the defect did not exist in the contract, in my opinion it would not be abused as much as it is; while, having that ambiguity there, it gives these people an opportunity, if they so desire, to take advantage of it, and I think in many cases they so desire.

Q. Does the statute provide a penalty for it?—A. It does. (Reading:) "And such corporation shall weigh out and deliver to such shipper, his consignee or other persons entitled to receive the same, at the place of delivery, the full amount of such grain, without any deduction for leakage, shrinkage, or other loss in the quantity of the same." There is another violation in the bill of lading, because they say they will not be liable. (Reading:)

"Damages. In default of such delivery, the corporation so failing to deliver the full amount of such grain shall pay to the person entitled thereto the full market value of any such grain not delivered at the time and place when and where the same should have been delivered."

"Evidence—shortage. If any such corporation shall, upon the receipt by it of any grain for transportation, neglect or refuse to weigh and receipt for the same, as aforesaid, the sworn statement of the shipper, or his agent, having personal knowledge of the amount of grain so shipped, shall be taken as true, as to the amount so shipped; and in case of the neglect or refusal of any such corporation, upon the delivery by them of any grain to weigh the same as aforesaid, the sworn statement of the person to whom the same was delivered, or his agent, having personal knowledge of the weight thereof, shall be taken as true, as to the amount delivered. And if, by such statements, it shall appear that such corporation has failed to deliver the amount so sworn to be shipped, such corporation shall be liable for the shortage, and shall pay to the person entitled thereto the full market value of such shortage, at the time and place when and where the same should have been delivered."

There is a section, in regard to the scales they should use. The law is good all along, and in my judgment this bill of lading is not consistent with that law.

There has been further legislation in regard to this subject. The question came up as to whether or not the warehouses were public or private. Of course, Judge Tuley took this matter up in his opinion, and I think he discussed that very carefully, and I believe that the commission will find some valuable points in that. That opinion, I will say, has been affirmed by the supreme court of this State, which virtually negatives the law passed at a recent session of the legislature annulling the law, upon which Judge Tuley based his opinion. Under this law, every public warehouseman is required to have a license; and this is the section that refers to that (reading):

"Section No. 136. The proprietor, lessee, or manager of any public warehouse of class A shall be required, before transacting any business in such warehouse, to procure from the circuit court of the county in which such warehouse is situated, a license, permitting such proprietor, lessee, or manager to transact business as a public warehouseman under the laws of this State, which license shall be issued by the clerk of said court upon a written application, which shall set forth the location and name of such warehouse, and the individual name of each person interested as owner or principal in the management of the same; or if the warehouse be owned or managed by a corporation, the names of the president, secretary, and treasurer of such corporation shall be stated; and the said license shall give authority to carry on and conduct the business of a public warehouse of class A in accordance with the laws of this State, and shall be revocable by said

court upon a summary proceeding before the court, upon complaint of any person in writing, setting forth the particular violation of law, and upon satisfactory proof, to be taken in such manner as may be directed by the court."

That is the way these warehouses are created. They have to get a license first, and that is the question upon which hinged this whole thing of whether a man could be a warehouseman and a dealer at the same time; and behind that is a constitutional provision, which I think you will find in the amendments to the constitution that were passed in 1871, which provides for the manner in which the grain should be unloaded. Then there was another law passed by which they amended the law, so that in a city of the size of 50,000, I think it is—I have got the law here, a section of it (reading):

"Section 192. Road[s] receiving for transportation shall furnish suitable appliances for weighing, etc. *Be it enacted by the people of the State of Illinois represented in the general assembly,* That in all counties of the third class, and in all cities having not less than 50,000 inhabitants, where bulk grain, mill stuffs, or seeds are delivered by any railroad transporting the same from initial points to another road for transportation to other points, such road or roads receiving the same for transportation to said points or other connections leading thereto shall provide suitable appliances for unloading, weighing, and transferring such property from one car to another without mixing or in any way changing the identity of the property so transferred, and such property shall be accurately weighed in suitably covered hopper scales, which will determine the actual net weight of the entire contents of any carload of grain, mill stuffs, or seeds at a single draft, without gross or tare, and which weights shall always be given in the receipts or bills of lading and used as the basis of any freight contracts affecting such shipments between such railroad companies and the owners, agents, or shippers of such grain, mill stuffs, or seeds so transported and transferred."

They require that the grain shall be weighed in hopper scales to eliminate its being weighed by track scales, for the reason that the inaccuracies are so great; because there were cases where cars would come in here covered with ice and snow, and the grain would be sold and the Western car would be sent over to the Eastern road, and it would sometimes take three weeks before that car would be returned to be reweighed, and when it was weighed the second time that snow and ice would be all melted off, and it would not be in the same condition, and consequently that would be a factor in the weight of the grain, and it necessarily makes that inaccurate. The railroads have protected themselves in that way. That was the object in putting it in, in my opinion. Well, of course, we found that that system of weighing grain was entirely unsatisfactory. The idea of it was to keep it out of the elevators and sell it by sample, and the only way was to weigh it on track scales. I was then actively engaged in the shipping business, and I got up this plan of taking the grain out of the cars and weighing it in hopper scales, and we put it in on the railroads. The railroads did not want anybody to check it. I was practically the weighmaster here for that class of commodities, and the result of it was they broke a contract with me. I had a 10-year contract, and it ran nearly 2 years. That has been all settled. We got through with the fight. But the Michigan Central and some other lines here are using another device which I also claim to be mine, which practically does this same thing. But they did not change their form of bill of lading any. The weights are all right. They do not take any liability because our experience was that the average shortage on the weights where they were honestly weighed out and honestly weighed in was about 80 pounds to the car; so there is no reason why they can not give clean bills of lading if they want to.

Q. Scales at the initial point would remedy that matter, would they not?—A. It would, but they could not put them in. The railroads would not accept those weights. Whether you could compel them to do it is another question.

Q. When you send stock or furniture—any local freight—they always weigh it, do they not?—A. Yes; they weigh it in, and I do not see why they should discriminate against grain. The trouble is that our methods are all pretty loose about the grain business. I will emphasize the statement I made here that the grain business in the United States is about the biggest thing we have here; yet I do not think there is a business that has so many loose ends and is conducted so loosely as it is. I think that settles the bill-of-lading question. That is about all I have got to say on that question. Now, at some point in this proceeding I would want to show you what this process is that you asked me about yesterday.

Q. What process is that?—A. The system in use by the Michigan Central, the Grand Trunk, and other lines that are using it. I have worked a good while on this thing, and have got it so it works all right, but, as I say, I have got tangled up with these fellows, and I do not know when I am going to get out.

Q. (By Mr. A. L. HARRIS.) All you have to do now is to preserve the number of the car taken out, and when it comes in, and the road it belongs to?—A. Yes; we give the history of the car there, its inspection, and its destination. Now, this is Chicago car 2550; it comes in over the Michigan Central—800, and a record is kept so that you can give an absolute record of everything connected with the time it came in, the condition the car was in, and the condition the car was in when it went out.

Q. (By Mr. CONGER.) How long does it take to unload a car?—A. I have unloaded 5 cars in 8 minutes.

Q. Generally are they in one hopper?—A. Oh, no; each car at a separate hopper, and they were all unloaded at the same time. I could unload 20 in 8 minutes if I could unload all at the same time. Where the volume of business requires it, it is just as easy to put up a big house as a little one. Of course, I have been brought in contact with these questions by reason of my personal interest in the matter. I do not disguise the fact that I have been working on this line, and you must judge for whose benefit it is. I claim that I have made some money and the public have been benefited by it. I have guaranteed to reduce the expenses 75 per cent the cost of handling grain in Chicago. Under the old system it was a cent a bushel, and I charge a quarter of a cent; that is knocked off, and we guarantee against any inaccurate weights; and in all my experience I never had but 2 cases where I had to pay shortage—where my weighmaster got drunk and made a mistake and it was proved up, and I paid the loss.

Q. (By Mr. A. L. HARRIS.) If your system is adopted there will be no necessity for the conditions in that bill?—A. It all goes right here in the bill of lading; that is the germ.

Q. I can see how they have protected themselves in the conditions that they prescribe; but now here is an absolute way; there is no tare in it at all?—A. No; it is just like a grocer buying and selling sugar. He buys the sugar on the scale and not the barrel or box.

Q. Have you not a law that would seem to give full protection, if enforced?—A. It will not take but a minute to read this section. The State of Illinois was so pleased with this plan that they passed a law requiring it to be done.

Q. Is that law evaded?—A. It is partially complied with. We have four or five roads here in the city that are using it; there are some that are not.

Q. Is there any reason for their not complying except the reason that you stated, except the reason that the shipper did not want to come in conflict with the railroad?—A. The shippers are all like this: You read the testimony that I have from Boston, New York, Philadelphia, and all over the United States in regard to those weights. They are accepted as satisfactory and final; the Board of Trade has indorsed it; therefore we do not have any trouble except with the railroads and elevators. Perhaps they have been jumping on me a little.

Q. Under the law the requirements are stated?—A. Yes.

Q. And here is a plan by which the weight can be ascertained accurately?—A. Yes.

Q. Why is this law not enforced?—A. Just for the same reason that a great many other laws are not enforced—because they are obnoxious to the people whom they are enforced upon.

Q. What would you suggest for a remedy, when there appears to be a sufficient remedy on the statute books?—A. I suggest this: If you give the Interstate Commerce Commissioners the power to enforce the laws that are already in existence—I am talking of these laws right here, some here in Iowa and Nebraska, because you can not make any laws that will conflict with the State laws—but if the Commissioners' powers are extended so as to give them these police powers, they can compel the enforcement of this law.

Q. Then there is no conflict between the railroads and the grain men; there can be none?—A. No, there is not. There are other matters between the grain men besides this. I do not want you to think that I am trying to advance my own point, because there are other systems that are practical and just as good as this. It is the principle I am working for. If the law is enforced and the power rests only with the Interstate Commerce Commission, we can not make a law in this State that is going to be effective against it. Consequently, if it is interstate business, it must come under the jurisdiction of the Interstate Commerce Commission. It is the only power in the world that can manage it, or some other power that Congress may delegate.

Now, in regard to the elevator question, my contention is that the producer will be benefited if he can send his grain to an open market, where it can be sold in the open market, subject to the rules and regulations and the laws of trade. He can not do it in this town to-day, simply because the price is set on it before it

comes here. The same way in regard to hogs and cattle. There is a little coterie there that has had that thing, and they fix it. It used to be that the price in Liverpool cut some figure, or in New York, but I don't think it does now. If it does, it is done so invisibly that you can hardly see it.

Q. You mean it is arbitrarily fixed now by this little coterie?—A. I would say that. That is a pretty strong term to use, but will I say that it is practically arbitrarily fixed. These fellows manipulate the market to suit their own purposes.

Q. Without regard to the conditions of the market?—A. Yes. You can see how that is. We have 40,000,000 bushels capacity, and sometimes the elevators are pretty full. I do not know how they are to-day; but when you get a large accumulation of stock—it don't matter what it is, whether it is boots or shoes or grain—if there is a glut in the market the tendency is to depreciate the price. There is no reason why these fellows can not create that glut at any time; they control the elevators, and can get the grain.

Q. (By Senator KYLE.) Is it a fact that they make it a practice to keep their elevators full here on account of collecting the storage charges?—A. It would be their policy to do that. I think their rate has been reduced to three-fourths of a cent a bushel, and of course that is something. At 600 bushels of wheat to a car that would be \$4.50 for the first 10 days.

Q. And one-fourth of a cent for each 10 days after that?—A. Yes; but there is big money in it at that, and of course the more grain they have the more they can make out of it.

There are two points I want to speak of there, and one is an open market if you are selling the grain by sample. As I explained yesterday, there is a difference in the same grade of wheat or the same grade of corn; there is not any kind of grain but what there is a wide range between the minimum and the maximum quality of that grade; so to the sample there is an intrinsic value attached.

Q. How is the price practically fixed before the grain is harvested; how?—A. For example, to-day the warehousemen will send out a card to their representatives on the trunk lines, stating that they are paying so much for grain delivered at such a station to-day or to-morrow. They will get the postal card to-morrow morning, and that is the price they are authorized to pay for that grain. They probably will get telegrams changing it; it may go up or down; but in that way, I say, the price is fixed. It used to be that these country shippers would send their grain in here to a commission merchant and the price would be determined after the grain got in; that was governed a good deal by the receipts and shipments; but those legitimate influences appear to have become obsolete.

Q. Do you think the price is more often depressed than otherwise by such an arrangement between the buyers?—A. That would depend altogether on the tendency of the manipulators. Our speculators here have generally been bears.

Q. Which is a severe thing for the country shippers?—A. Yes. The plan of making the market, coming up to within perhaps a year or two, has been to take the bear side and sell the stuff short, because he could sell it for more than he could sell it to-morrow. In other words, if he sold to-day, he could buy to-morrow and make a profit, and some of our more successful speculators followed that. Mr. Partridge was one of our biggest plungers, and that was the side he always took. It was very seldom he was buying the market. But lately the man that has the money is generally fixing the price.

Q. (By Mr. A. L. HARRIS.) Which is the better for the producer, the present system of buying or selling on a card price, or the old plan, the local merchant buying and keeping the margin between himself and the consignee?—A. I think the old plan as we had it at first. I do not think the card plan is a good one.

Q. I have had some experience in selling wheat. Our market for a number of years has been Toledo, Ohio. Under the old plan they kept a very wide margin between the local grain dealer and the price at Toledo each day. Under the present system they bid closer for wheat each day than they did under the old system, from the fact that the local grain dealer knows just what he is doing, and we get more for our wheat; that is, we get nearer the Toledo price, with the cost of transportation and commission added, than we did under the old plan of selling to the local grain dealer, because of the certainty. He knows what he is doing each day. What have you to say on that phase of it?—A. Don't you think that is occasioned by the fact that when the commission merchant makes you a bid for that wheat, and you accept that bid, he aggregates his purchases of that day and sells in New York or Chicago against that wheat, or in Toledo?

Q. I understand the card system they use there is this: At 9 o'clock, in the morning mail, the grain dealer at Eaton gets a bid from his Toledo correspondent, or the man he is shipping to, and that usually runs good for about 3 days unless it is changed. Now, during that time the grain man fixes the price that he is paying for wheat, and probably he will give 3 days for that wheat to be delivered.

He immediately wires the grain man at Toledo what he has done during that day, and the farmer has 3 days to bring his wheat in.—A. Don't he have the same opportunity on the first day the price is fixed? As far as the delivery is concerned, that may be a longer time or a shorter time.

Q. As I understand, the Toledo man gives him the 3 days for the delivery at Eaton, and then a certain number of days for the delivery at Toledo. Of course to-morrow that may be changed for 3 days in the future again, and then our local grain merchant pays for wheat what his orders are for to-morrow, or rather what the bid is for to-morrow, and these 3 days I have to deliver my wheat are still good, even if wheat goes up or down. If it goes up, I still have to take what I sold for; if it goes down, I take what I sold it for.—A. As I understand the way we do here in naming the price, it is good for to-day. The country buyer is governed by the price for to-day only. If he buys any wheat, he reports that to his principal in Chicago, and that principal may, if he wants to, sell against it to hedge himself against any loss, and then he holds the shipper for the delivery of that wheat. Of course, one difficulty that the farmer, the producer, may fall into, is that the grade may be mixed. Of course if he is going to go into the market and buy it, that is mostly a loss; but where everything goes over here, that does pretty well, because they know just what they are going to get for the wheat before they ship it in. Of course there are times when they have their little contentions about the weights and mixing the grades, which the farmer has to take the chances on.

Q. Don't we have to take the chances, because we have to deliver No. 2 wheat to sell?—A. Yes, as far as the obligation of the farmer is concerned as to the delivery of the wheat, it is a matter that rests between him and the shipper. For instance, we may sell September wheat; we may sell August wheat; we may sell wheat for August delivery. This is practically cash wheat. For instance, I sell 1,000 bushels of August wheat or 5,000. That is always, at seller's option, to be delivered in August. We have 20 days to deliver, but the price must be fixed to-day, because we don't know what it is going to be to-morrow.

Q. There is an impression among our farmers that the present system brings them nearer the Toledo price than the old system, where the local grain dealer took the risk. He either made more or he made less.—A. I guess perhaps he knows a little better what he is doing than he would where he had to wait 3 or 4 days or a week to get returns from his commission merchant after he shipped the stuff in on an open market; and if that is so satisfactory it would be well not to disturb it.

On the 7th day of March, 1893, the Chicago Tribune published an exhaustive statement of the investigation that was made by them in regard to this very question. I went yesterday and consulted the files.

Q. Did you secure a copy?—A. No; I do not think it can be secured. I think it is in the files in the public library. All the papers are there. I was interested in getting that thing up. I was employed by the Chicago Tribune, in connection with Mr. Vanderlip, now Assistant Secretary of the Treasury. We went out and made an exhaustive investigation of the subject, and it was published in full in the Chicago Tribune of that date, and on the following day they had interviews from the Members of Congress. In the first place I must explain, possibly, a little inconsistency. This article was prepared, say, on Friday, and ready for the press. The paper was printed on Friday and dated Monday, the 7th day of March, and they were sent to Washington in a special edition and placed on the desks of every Member of Congress, and on that same day, after the paper had arrived there, the Tribune had a corps of correspondents who went around and interviewed the Senators and Members of Congress as to their views on the interstate-commerce question, and they drew forth some very fine expressions; and it occurred to me yesterday, after I was here, that it might be of great interest, and perhaps service, to your commission to read those statements, because we hunted up the very best men we could find. We went to governors and railroad managers, and presidents, and bankers, and all classes of people, and interviewed them freely; and it was in that line that I got this information as to the manner in which these rebates were secured which I explained to you yesterday. So I would suggest to you, gentlemen, if you desire, that when you return to Washington you invite Mr. Vanderlip to come before you and express his views. I think he has some very decided views on the question, and I think they are very valuable.

Q. There is one question I want to ask you about: Could the Interstate Commerce Commission, either as a court or as a commission, without interfering with State rights, enforce a law of Illinois?—A. I do not see why not. A man in Iowa can come here and enforce the law here. If he can come and enforce the law, why should not the commission? You are nothing but a combination of citizens outside of your official capacity.

Q. Are you not making a Federal court to enforce a State law, which is usually

the province of the State court?—A. The State can not enforce that law as long as it is left outside of its own State. Here we take a car of grain and run it 17 miles and it is in Indiana; we have lost our entire jurisdiction.

Q. But where does the right of action accrue?—A. That is the question. If I ship a carload of grain from Chicago to New York under a bill of lading, after it has gone 17 miles it has gone into Indiana. It may not have leaked a drop when it left Illinois; it may have gone through Indiana, Ohio, and New York State and into Massachusetts; in that journey there has been a loss. Where has that occurred? The shipper can not tell, and you can not pursue him with any law that I know of. You can not pursue him in Massachusetts, because the law may be entirely different there from what it is here. That is the way I understand it. I made that point in discussing the question with the president of one of the Illinois lines, and he said, "You can not enforce the Illinois law in Massachusetts."

Q. Now, what I want to get at is the power of the Interstate Commerce Commission to enforce an Illinois law in Massachusetts.—A. It is absolute, I think.

Q. Can a Federal tribunal enforce a State law?—A. If I am a citizen of Nebraska, I can pursue an Iowa man.

Q. Where do you get at him; where do you bring your action?—A. Wherever I can get service on him. I could sue him there. Those are legal questions that I would not assume to answer.

Q. The reason I asked the question was I thought you might be clear upon that point.—A. Well, I am, in my own mind, but I do not mean to say that I am correct about it. I am not a lawyer, and I do not know whether I would be authority on it or not.

Another thing I spoke about: I suggested yesterday that in making amendments to the interstate-commerce law, we want to get down to the abstract principles of the business we are trying to manage; that is, to get to the very root of it; and I sketched off these little amendments here as suggestions merely. Now, if you care to hear them I will read them or I will leave them.

(Being requested by the subcommission to read said suggestions, the witness read as follows):

DRAFT OF PROPOSED AMENDMENTS TO THE INTERSTATE-COMMERCE LAW

[Submitted by Edward S. Richards, Chicago, Ill.]

"Be it enacted, etc.

"SEC. 1. That all carload lots of grain or seeds shipped from any point in one State to any point in another State, both being within the boundaries of the United States of America, shall be known and classed under the law as interstate-commerce traffic, and shall come under and be subject to all laws, rules, or regulations made and hereinafter provided for or contemplated by this act.

"SEC. 2. The Board of Interstate Commerce Commissioners are hereby authorized, empowered, and directed to make and enforce such rules and regulations as are now already in force, or that may be hereafter provided, for the proper protection to the owners of such shipments of grain and seeds while in transit from its initial point of shipment to its destination; and that are not in conflict or inconsistent with the laws or regulations in force in the State where said shipments originate, or to which they may be consigned for sale, use, or reshipment.

"SEC. 3. It shall be the duty of every common carrier receiving grain and seeds for transportation to issue to the owner or shipper of such property, covering the same, a receipt or bill of lading, in which shall be plainly and correctly stated the kind of property and the actual net weight of the same, which shall be the basis of all freight contracts, and upon which any and all claims for shortage, damage, or loss in weight while in the possession of said common carriers for transportation and delivery to the destination and consignees named in said receipts or bills of lading shall be made and adjusted.

"SEC. 4. It shall be the duty of the Interstate Commerce Commission to see that all laws, rules, or regulations affecting the weighing in or out of the cars containing grain shipments, at the initial point of shipment, intermediate transfer points en route, or to the consignees at its destination, are justly and honestly enforced, and that the actual net weight of each and every carload of grain and seeds shall be plainly stated in the receipts or bills of lading issued by said common carrier to the owner or shipper of the same; which shall represent and determine the amount for which said common carrier shall be liable and responsible to the said owner or shipper of said property agreed to be delivered at the destination named in said receipt, bill of lading, or other contract between the said owner or shipper and the common carrier to whom it shall be or has been delivered for transportation.

"SEC. 5. In case there should be any shortage, loss in weight, or damage to the property received for transportation when delivered at its destination in accordance with the receipt, bill of lading, or other contract between the shipper and said common carrier, it shall be the duty of the said owner or shipper, upon the failure of the contracting carrier to promptly pay the same, to file in duplicate a properly authenticated claim with the Interstate Commerce Commission, concerning said loss or damage, based upon the actual cash value of the property claimed to have been lost or damaged while in the possession of said common carrier, and not delivered in accordance with the laws governing common carriers or the receipt, bill of lading, or contract issued to said owner or shipper when the property was delivered to said carrier for transportation.

"SEC. 6. Upon the filing with the commissioners any claim in duplicate, by any owner or shipper, against a common carrier, for loss, damage, or shortage in weight on any shipment of grain or seeds, it shall be the duty of the commissioners to furnish the common carrier complained of with a notice of said complaint, with claim attached, and notify both complainant and common carrier that said claim will be taken up for adjudication at a date within thirty days or as soon thereafter as practicable, upon sworn statements or depositions, by brief or orally, as may be agreed upon by the parties interested, within the thirty days or time designated by the commissioners. If the complainant or plaintiff fails to comply with this requirement within the time designated by the commissioners the cause may be dismissed without prejudice and at his cost. If the defendant common carrier fails to comply, a default may be taken and judgment entered against the defendant for the full amount claimed, together with costs of suit and reasonable attorney's fees, to be collected through the clerk of any United States district or circuit court as other judgments are collected.

"All costs will be taxed to the unsuccessful litigant and converted into the United States Treasury Department as an offset to the expenses of the commission.

"If, for reasons satisfactory to the commissioners, additional time is required by either or both of the parties, a continuance may be granted for not exceeding thirty days, each party being entitled to one continuance. After six months from the date of filing the claim, if the claim shall have been abandoned, it shall be stricken from the docket and can only be revived or reinstated as new business by refile of claim, payment of additional costs, etc., as in the original procedure.

"SEC. 7. All proceedings for the collection of claims against a common carrier under the provisions of this act shall be against the carrier or line issuing the original contract, receipt, or bill of lading, upon the theory that while the initial carrier may be only one of the many lines over which the property involved in said claim may pass in reaching the destination named in said bill of lading or contract, it binds all connecting lines as principals through their agent, the contracting party, in the business created by said contract or bill of lading, and in which they are copartners in the division of the profits and losses arising from such business; and any judgment or order made by the commissioners shall be valid each or severally against the entire combination of interests represented in such contract or bill of lading, but it shall be collected by execution, if necessary, from the carrier or transportation company issuing the original bill of lading, upon which said claim shall have been established by evidence before the commissioners.

"The commissioners are hereby empowered, authorized, and directed to exercise the full and complete jurisdiction of a trial court, with the same powers as are conferred upon the circuit and district courts of the United States. An appeal may be made from the judgment of the commissioners to the court of appeals, whose decision shall be final and without appeal, unless involving constitutional questions, which alone may be appealed to the Supreme Court of the United States.

"SEC. 8. It shall be the duty of the commissioners to supervise and direct the inspection, storage, weighing, and transfer of all interstate grain and seeds while in transit from producing to consuming markets, and they are hereby empowered to make and enforce such rules and regulations as will give full and absolute protection to this class of property as will prevent the improper inspection or grading of such grain and seeds, or the improper weighing, mixing different grades, or separating the different qualities of the same grade of grain or seeds when placed in the storage bins of an elevator or public warehouse in order that a fair uniform average quality may be obtained that will honestly and fairly represent the quality of the grade to which it belongs.

"No interstate grain while in transit by rail shall be allowed to be stored in any elevator, warehouse, or other place of storage where the owner, manager, or any of its agents operating or interested in such elevator deal in grain on their own account, and which is stored in such elevator, without the written permission of the owner of said grain."

Here would follow a penalty clause for violation of any of the provisions or requirements of this act.

This practically brings this warehouse question right before Congress so far as the interstate grain is concerned. So far as grain originates and ends in Illinois you have no jurisdiction whatever. On interstate grain you would have absolute control, and it brings this elevator question right before Congress; and in my judgment there is where it belongs, because if you have power to regulate the rate, and power of prescribing the kind of coupling they shall put on the cars, you have certainly a right to regulate the manner in which the property shall be handled while it is in transportation. It seems to me so.

There is only one thing I want to suggest, and that is in regard to the organization of the Interstate Commerce Commission. You have some good men, but they are all lawyers, I think. I do not want to have you feel that I am finding any fault, but simply as to getting practical results it seems to me that in the organization of all these commissions, the labor commission, if you have one, and the Interstate Commerce Commission, they should be made up of men who are practical. Now, for example, I would have one member of this commission an agriculturist; take a man like Secretary Wilson, of the Agricultural Department—I think he is the right man in the right place; and another man who represents the manufacturers, and another man who represents the commercial and merchandizing interests, and have an attorney, a good man that would be competent to be a good judge and would be competent to be, perhaps, chairman of the commission, and hold them up to the level in the line of the law. Having a good set of men in there, they would settle these questions more quickly than a lot of gentlemen who are versed only in the law.

Q. (By Senator KYLE.) You think they would point out the difficulties at once?—A. Yes; they would. I believe it was President Harrison who said he would not appoint any man who was not competent to occupy a position on the Supreme Bench of the United States Court.

Q. (By Mr. A. L. HARRIS.) Don't they have very intricate law questions to solve?—A. Perhaps they do, but one lawyer is just as good as half a dozen.

Q. Like a doctor, he may want counsel?—A. Well, he can go out and get counsel. If you are sick and the doctor thinks he has a big job on hand he will go out and get counsel. You don't call in two or three doctors. My theory about this whole business is that the Government is nothing but a big corporation. It ought to be run just as a man ought to run his own business. Now, I think if we can start right by getting efficient men in, in the first place, we get the benefit of their life's experience in the lines which they can follow, and I believe that we will get better, quicker, and more satisfactory results on that line.

CHICAGO, ILL., August 10, 1899.

TESTIMONY OF MR. MILTON GEORGE,

Agriculturist, Chicago, Ill.

The subcommission on agriculture met in Chicago, Ill., August 10, 1899, at 2.40 p. m., Mr. A. L. Harris presiding. Mr. Milton George, being first duly sworn, testified as follows on the subject of agriculture:

Q. (By Mr. A. L. HARRIS.) You may state your name, place of residence, and occupation.—A. My name is Milton George; Chicago is my residence. I am interested at the present time in the development of Mexican lands on the cooperative plan. That is the only occupation I have at the present time, except being interested in the boys' home, south of the city, the Glenwood School for Boys. I founded that 10 years ago.

Q. What has been your occupation in life?—A. Agriculture first and agricultural newspaper work later.

Q. What have you to say in reference to the earnings of capital invested in agriculture, compared with any time, say, within 40 years?—A. The cost of production has greatly decreased in proportion to the development of the modern facilities, which have added to the man power so many times. It costs, I suppose, not more than one-quarter as much to produce a bushel of wheat now as it did 40 years ago, when we cut it with a cradle.

Q. Which makes the earnings of capital greater?—A. Yes.

Q. What have you to say in regard to the earnings of capital invested in agriculture compared with the investments in other industries, such as banking and manufacturing?—A. Well, I think they are less. I would say that 3 per cent would be a fair estimate of the earnings of capital devoted to agriculture.

Q. Do you give the farm now the full credit of the living of the farmer?—A. Yes.

Q. You would think that 3 per cent would be a fair estimate?—A. I think so. Of course some earn much more than that naturally, and others earn nothing. The farms are making good progress in diversifying agriculture, and that is adding to their crops. In the Northwest, up to within a very few years, they devoted almost everything to cereals; now they are practicing rotation and the rotation adds to the output of the crops, and altogether I think they are making very favorable progress.

Q. What about the taxation of agricultural property?—A. Having been an assessor in the country years ago, I know some of the methods by which men of money escape taxation, while the farmer, with his visible assets, is subject to the assessor's estimate at all times.

Q. (By Senator KYLE.) Do you think that the farming class in the United States pays much more than its fair share?—A. I have never undertaken to make an estimate of that, but I would say considerably more. For instance, the banker in our town said to me, after the assessment had been made and the taxes collected, that he bought Government bonds previous to the 1st of May, when the assessment should take place, and when the assessor had made his estimate he found it profitable to sell the bonds again and loan out his money at sometimes 10, 15 to 20 per cent on short term paper. So it did not pay to keep Government bonds, if he could sell the bonds again after the assessor had got through.

Q. Have you any suggestions to make of amendments to your State law in regard to taxation?—A. It has been my belief that the only way you can reach capital successfully or reasonably is by an income tax. It is the easiest thing in the world for a man to pay his taxes if he gets the money; but it is not an easy thing to pay taxes if he is not earning anything or is losing money. It has been my experience in this city that property is really confiscated because of being tangible, while people who have had their investments in some other form have been escaping. That has been demonstrated to some extent by our new law in this State, which has changed the policy of assessing.

Q. How do they escape?—A. It is a little difficult to explain all the ways in which they may escape. They escape by not listing. Even under this compulsory law, enacted at the last session of the legislature, they are refusing to schedule. It is difficult to make them schedule their property. A man naturally does not want to lie if he can escape it by saying nothing at all.

Q. What have you to say in regard to the prices of agricultural products?—A. They are fixed by competition with the products of the world, in foreign markets. Of course, there are other likely reasons; there are some in operation in this country which affect prices more or less.

Q. The natural law of supply and demand has something to do with it?—A. Something. It means we depend upon the foreign market for the selling of our products, to some extent, and our surplus is usually large enough to make it necessary for the foreigner to really fix the price of our products in a large measure.

Q. If you raise 600 million bushels of wheat and export 100 million bushels, that 100 million bushels fixes the price substantially?—A. I think so. As I said before, there are other causes, at home perhaps, that should not prevail, which might be remedied by proper legislation.

Q. Are there any advantages in large farms as compared with small farms?—A. No; I think not.

Q. Which has the advantage really?—A. I think the smaller farms have the advantage.

Q. Do they develop the country more rapidly?—A. They have more thorough cultivation. The large farms are usually farmed in a slipshod manner. The smaller holdings are the more successful, I think.

Q. Are the large farms breaking up into the smaller ones, or is there a tendency to get big ones?—A. Going into the hands of men who have money, who buy to hold for a rising price; or if they can rent it out for \$5 or \$6 an acre, and have the taxes paid, they do it.

Q. Is that true in Ohio and Indiana?—A. It is in this State (Illinois). I do not know how it is in Ohio. In Illinois many of the best farms have been purchased by bankers, merchants, and the more successful farmers, as safe investments.

Q. Do you know whether or not, with the succeeding generations, the farms of half a section, a quarter section, or a whole section, are being divided up among

the children of the farmers, and getting to be 80-acre and 100-acre farms?—A. Well, the children have been leaving the farms and going to the cities, so that they have not been dividing up quite so much as in the earlier days. Children are leaving the farms. I think such times as we have now, when money is plentier, if the farmer wants to continue his indebtedness and hold on to his farm, he does so. A few years ago, in the pinching times, he would let go if prices were low and he could not make interest, and the landlord took the farm. That happened usually. Of course, some farmers have been forehanded enough to loan out their money and perhaps add to their farms by picking up their neighbor's, who could not carry longer.

Q. (By Mr. A. L. HARRIS.) Have you at any time been interested in the organization of farmers for their mutual benefit?—A. Yes.

Q. What organization have you been connected with?—A. The Farmers' Alliance.

Q. What were the objects sought in organizing the farmers?—A. For social and intellectual culture in the main, and cooperative effort.

Q. From your observation, what has been the effect of organization among the farmers?—A. Well, I think it has been very good. The granger laws, you know, came out of the organization of the Grange, and I think perhaps the butterine law. I was the first one to take up the question of legislation on the question of butterine. The Farmers' Alliance assisted a great deal in securing legislation on that question.

Q. What is the social condition of the farmer at the present time compared with former years?—A. In one sense perhaps better, and in another I do not know whether they are any better. I think farmers make a mistake in allowing their sons to go to the village to stand around the street corners in search of opportunities. If they could organize they might have them in much better social environment, in a way to advance the intelligence of those in search of opportunities in the agricultural districts. These orders were all on nonpartisan plans in the first place. The constitution and by-laws precluded any idea of partisanship, but farmers did not hold to that. While they might have done so theoretically, practically they became political parties, and in that way the organizations have failed.

Q. In seeking legislation beneficial to the farmer, would you have looked at it in a partisan way?—A. No; intended to be done in a nonpartisan way. Later the declaration of principles of the Farmers' Alliance was used as a platform practically for the Peoples' Party. While they admitted or claimed perhaps that the Alliance was not partisan, unless a man was a good Peoples' Party man he could not be a good Farmers' Alliance man.

Q. What is the condition of the order at the present time?—A. There are 5 different organizations. I suppose there is a fragment of each in existence somewhere. None of them are strong. The grange perhaps stands at the head, on a firm basis. That has steered clear of partisan interference during the last 25 years, and has succeeded pretty well since its first experience.

Q. (By Mr. CONGER.) Can you name those organizations besides the grange and the national alliance?—A. There is the Farmers' Alliance proper. Then there is the Farmers' Alliance and Industrial Union, which is the southern branch of that organization; and the Farmers' Mutual Benefit Association, the Patrons of Industry, and the Patrons of Husbandry, or Grange.

Q. (By Senator KYLE.) Do you think it is possible to organize the farmers thoroughly for commercial end?—A. I do not.

Q. For the real benefit of the farmer as regards the price of his crops and so on?—A. I doubt it. I worked very hard at it for several years, and spent a great deal of money. There are so many interferences that failure seems to be inevitable in the end.

Q. You have been called upon to organize in order to get your rights, the same as commercial bodies?—A. Yes, but it is difficult on account of interferences. The leaders become ambitious and want offices, or some outside influence gets in to use the Grange or the Alliance for their own benefit, and they often get enough in that way to wreck the enterprise. That has been my observation all the way through.

Q. (By Mr. A. L. HARRIS.) Is it possible to cooperate and make it useful?—A. Yes, to some extent. I believe in cooperation. The farmers are not always true to their own interests. They organize a Grange store, for instance, and run it a while, until some merchant who has more experience in the business and more money will cut prices for the purpose of eliminating a competitor, and succeed, because farmers break away from their own store and buy where they can buy cheapest; they do it often.

Q. What have you to say of diversification of agricultural industry, and its advantage to the farmer?—A. Well, clover is the great thing on any soil where it will

grow. It does not grow in the Southern States; but for the Northern States there is nothing equal to clover. Clover has many qualities—the quality of thick foliage, which makes a shade for the soil, and prevents the decomposition of the soil. You know the soil is organic and it only decays fast enough to give up its organic property sufficiently rapid for the growing vegetation. It should not decay more rapidly than that. If you expose your soil constantly it will give up more than the plants can use. That is, this decomposition is going on in the soil, as you know, and your soil is becoming inorganic instead of organic, the organic form being necessary to a productive soil. That is one of the reasons why the Southern States are sterile. The humidity and the continual warmth decompose the soil, and the cultivation they give their land down there—cotton and corn, which only cover the land a part of the year; the remainder of the year the soil is bare and uncovered, so that the organic part of the soil is constantly being eliminated in that way by exposure. Clover is a great thing to preserve the fertility of the soil and adds to it by the nitrogen which it takes from the atmosphere and deposits in the soil. It is one of the most useful plants we have, and it makes a splendid ration for domestic animals, being highly nitrogenous. The swine plague is prevailing just for the reason that the corn is starchy. The corn is fed to swine and they lose their vital energies for lack of the nitrogen and phosphate which are necessary to add to the muscle and bone development. So that when you rotate your crops and include clover, blue grass, or timothy, whatever it may be, you are increasing the fertility of the soil.

Q. Are fertilizers used in Illinois?—A. I think the soil of Illinois, where it has been properly managed, is more fertile now than the virgin soil at the first breaking of the prairie was.

Q. (By Senator KYLE.) It seems to me the corn is taller in this State than it used to be 25 years ago.—A. And the stalks are larger around.

Q. (By Mr. A. L. HARRIS.) You think really the soil is getting better?—A. I think so.

Q. That promises well for the future?—A. Yes; for the perpetual productiveness of the soil of this western country.

Q. Has improved machinery, as well as improved methods, had anything to do with the present production of the soil?—A. Yes. It has made possible this thorough cultivation of the soil, and it has increased the yield, of course; but in the growing of animals the amount of machinery necessary to run the farm is lessened because the use of harvesters is reduced; you only need your mowers and your rakes and so on, and carriers for hay.

Q. And the improved machinery has lessened the cost of production?—A. Yes; quite largely.

Q. What have you to say in regard to the increase or decrease of transportation rates from the producer to the consumer?—A. The rates have naturally fallen as the equipment of the railroads have been added to. Like all other enterprises, it has made its progress; the grades have been lessened. A few years ago the Illinois Central was reducing its grade wonderfully so as to add to the length of its trains. And the steel rails have added a great deal to the duration, and to the ease of drawing the train—less vibration—and the trucks, air brakes, and so on have been improved.

Q. This goes to the benefit of the producer?—A. Well, to some extent producers get the benefits.

Q. (By Senator KYLE.) Can you give any information about the comparative price of transporting grain 25 years ago and at the present time?—A. Not positively, because I have never studied the figures.

Q. You say they have fallen?—A. They have fallen materially; I know that; though I think in this State, for 15 or 20 years, our commissioners did not interfere with the rate the railroads were charging after the maximum charges were fixed by our commerce commission when the law was first put in force.

Q. You think the railroads kept, perhaps, enough below that to not require that the commission should make rates less than 8 cents a mile for passengers or less than the freight rates allowed by the commission?—A. Yes.

Q. How about the prices of commodities between these two periods?—A. They have fallen somewhat, I suppose, too, on an average, but have varied greatly.

Q. Twenty-five years ago and now?—A. I remember the time that you could not sell corn for 10 cents a bushel in this State; you could not find a market, even at 10 cents, in exchange for merchandise.

Q. Was that in 1870?—A. No, it was in 1840-1844.

Q. (By Mr. A. L. HARRIS.) Before you had transportation—lines of railroad?—A. We had rivers. I lived in Fulton County, this State. We could not sell pork at any price. My father packed his pork and sold it out later.

Q. That is some of the experience you can remember with regard to the hardships of farming?—A. Yes. So that when you discuss this question of reduced prices and so on, as a whole, you must go away back and find a great many things.

Q. (By Senator KYLE.) Are the conditions good, as compared with 40 years ago?—A. Vastly improved.

Q. Farmers live in more comfort in their homes?—A. Yes.

Q. Better education and social privileges—all of these things?—A. Yes; much better.

Q. Since the time of the beginning of the war, for instance?—A. Yes. I remember seeing a man on the way from Peoria. I think corn was about 12½ cents a bushel, and he was hauling it down there to get gold to pay his taxes. You could not pay your taxes in anything but gold then. He got 15 cents a bushel in the city of Peoria when he arrived. The present times are quite an improvement on the good old times, but conditions might be better still, no doubt, for the average man.

Q. Did young men leave the farms in those days as frequently as they do now?—A. No.

Q. To what do you attribute the reason for that?—A. The monotony of the farm and the drudgery as compared with the attractions of city life. Until the farmer's son is educated in his pursuit as other classes are educated for their callings, he can have no real interest in the farm; it is drudgery to him. Intelligent labor is divine, but ignorant labor is drudgery. I think that is one of the reasons why farmers' sons leave the farm. Our agricultural colleges are not receiving but one in a hundred of the students that are coming there for the purpose of educating them in the conduct of a farm.

Q. I remember distinctly, in entering the University of Illinois in 1871, that it was an industrial university then.—A. Yes; they dropped the industrial. As that was the only part of the name that represented labor I opposed the change.

Q. Were a large number of the students matriculated into the agricultural department?—A. No; but I felt that it was essential that there should be more of them to carry out the purposes of agricultural colleges, and to encourage the youth in that direction. I founded an institution near Chicago for the purpose of educating boys in agriculture, a pursuit which includes all the sciences known to man, perhaps.

Q. Have you any further information to give in the way of transportation rates?—A. I have in reference to the commerce laws, and that is to so amend them as to allow railroad corporations to pool their earnings. Now, perhaps you would say that would be objectionable. Competition, you know, is wasteful and leads to discrimination among shippers. So long as railroads are subservient to the laws of the country and the people who grant the privileges which permit them to operate, whatever benefit can be given to the railroads can be taken advantage of by the people in return. If there is any advantage to the railroads in pooling their earnings, I say let them pool their earnings, subject, of course, to more stringent provisions than we now have in our interstate-commerce laws, so as to be able to give the benefit of whatever they may derive from pooling to the people, the patrons of the roads. Of course, there is a certain sentiment prevailing against railroads pooling their earnings.

Q. Isn't that quite a prevalent sentiment amongst the farming class?—A. Yes, it is; but I have been of opinion for a long time that it would be a benefit to the farmers and all classes of shippers to allow the railroads to pool their earnings under the strict surveillance of the Government.

Q. Under the present system, which are the favored classes of shippers?—A. The large shippers. The class that is already independent enough is favored; and the class which needs the favors is discriminated against.

Q. Do you think that if the jobbing class is favored now, some other class must be discriminated against in order to get even, to equalize the matter?—A. Yes.

Q. And that those who are discriminated against are the farmers and the small shippers?—A. Yes.

Q. Do you think it is ultimately against the interests of the farmers?—A. Yes.

Q. What restriction do you say should be placed on it?—A. I suppose the spirit and letter of the commerce laws require that the rates shall be reasonable and without favoritism, without discrimination; that really comprehends the whole thing. But under the present laws rates are not always reasonable, nor is there lack of discrimination. I can see how the farmers are handicapped in the country. For instance, in order to send their own grain to market, to save the middleman's tolls, they come in contact with the grain buyers and their associations. Grain dealers have State associations and their national association, and the individual grain buyers have their elevators. Naturally the railway companies cater to the

elevator men and the grain buyers, because it is less trouble to them. Suppose a farmer has 2 or 3 carloads of grain to ship? He applies for cars. Some grain buyer has grain to ship and he applies for 10 cars. The railroad company must see that the grain buyer has 10 cars where the farmer gets but 1. He may have to wait a month or two months for that grain buyer to have his 10 cars before he can have his 1 car, and he will become discouraged and sell out for whatever he can get. That is what the grain buyers want him to do; and so he is prohibited from having the best market for his product on account of that condition.

Q. (By Mr. A. L. HARRIS.) The big shippers?—A. Yes, the big shippers.

Q. (By Senator KYLE.) Do you say they do work together in this city?—A. Yes, I am quite confident of that. I have had some opportunity for observation lately on that point.

Q. What do you know, if anything, about combinations to control the price of farm products, not among farmers, but among those who buy; combinations which sometimes fix the prices arbitrarily?—A. Well, that is done, but to what extent I can not say. Of course, these corners are sometimes run apparently in the interest of the farmers. I think the Leiter deal was. That is the only corner I ever did see that helped the farmer. I think that helped the farmers and the entire country.

Q. Especially the farmer that had not sold his wheat?—A. In general I think it helped the entire country, because I think it gave them an opportunity to sell abroad wheat at 40 to 50 cents higher than what they otherwise would.

Q. You have had no experience then as to local combinations that buy grain direct from the farmer, controlling the prices?—A. There are combinations of that kind. Through these organizations, State and national grain-buying associations, and the railroad companies discriminating in favor of the larger shipper, they do in a measure control the prices of grain.

Q. Suppose the farmer is able to get the cars and consigns his wheat to a commission man, is he under any disadvantage?—A. Sometimes, in getting the grain buyer to weigh it for him, or the weight turns out unsatisfactorily. He may interfere in getting cars. If he finds the farmer wants to ship, he will order a few more cars than he wants to use, which is more than the railroad company is willing to furnish at that point, and in that way the farmer gets discouraged and tired, and needing money he will sell out for what he can obtain. A great many cases of that kind have come to my notice in the last year.

Q. Have you anything to say in regard to the effect of what is known as grain gambling, puts and calls, and so on?—A. I have watched that sort of trading a great deal. I think it is just as possible for a combination of large capitalists to bear the market as it is to bull the market, and I think perhaps easier to go on the bear side—that is, to sell whenever there is any tendency for markets to advance. I think prices are really kept down during years of comparative plenty. When there is a good deal in sight, it is a very easy matter to depress prices below what they should be, I am sure.

Q. (By Senator KYLE.) Do you think there is a disposition amongst the wealthy elevator men to depress prices from September to January each year?—A. Naturally so. I have not positive knowledge of that, but I think it is.

Q. Is it true that about 75 per cent of the farmers of the Northwest are compelled to turn off their grain during those months?—A. Yes; that is so. It is very easy to take advantage at such time, as lake navigation is closed.

Q. In your judgment, is it often done?—A. I think it is. A great many of those fellows go out and buy farm produce to carry in cribs, as well as to fill up their city elevators. Here is a question which our friend, Mr. Greeley, has been fighting—the question of an elevator man owning public elevators and dealing in the products of the farm at the same time. He is not only the custodian of the grain, but also dealing in a speculative way to advance or depress the markets.

Q. (By Mr. A. L. HARRIS.) Have you given any study to the subject of what are commonly known as trusts, the larger corporations now?—A. Yes. I think there are two sides to the trust question. Of course, to carry on great enterprises the organization of capital is necessary. Persons may call them trusts, but whatever you may call them I consider them to be a menace; they are a dangerous thing, unguarded against. I can see that one form of trust may not have a monopoly of a thing. Take the ice trust, for instance. There is no limit on nature's capacity for producing ice; so that is a little different from franchises which grant the rights to street railways, where all combine to put up the price of transportation. I can see how an ice trust may prove a great economy. Of course, there is another side still, because it throws men out of employment; but you can hardly say that it is not right to do so, if you can thus economize and deliver ice to poor customers for 25 cents a hundred instead of 40 or 50.

Q. (By Senator KYLE.) Have trusts always originated by capital? Are there not trusts among the labor organizations?—A. I think a labor organization is one of the most tyrannical trusts in existence.

Q. How about the plumbers' trust and the hod-carriers' trust and such as that?—A. I believe in organization thoroughly, and cooperation, but I believe these labor unions are the most tyrannical and dangerous institutions we have to deal with in this country. We must settle the question whether a man shall have a right to work and earn his living if he wants to without joining a labor organization. I understood that one contractor was limited by telling him how much stuff he should order and how he should sell his wares. And now go to him and want to name the hours of labor and the wages, and leave him only the privilege of paying his men.

Q. (By Mr. A. L. HARRIS.) Are you conversant with the provisions of the interstate-commerce law and its workings?—A. I am not very familiar with it; I have not studied it enough.

Q. What have you to say in regard to its extent, and whether any amendments are necessary?—A. I think the law needs amendment; it seems to be inoperative in a good many ways that it might be improved on. Of course, it was a compromise measure. I visited Congress previous to Mr. Cullom's election to the Senate, and carried down a large number of signatures in behalf of the petition. I found there were 3 or 4 bills in Congress, 1 by Mr. Reagan, 1 by Mr. Henderson, and 1 by Mr. Weaver, and I saw the difficulty of getting legislation on the subject of the regulation of railroads. Each one had his hobby and was unwilling to surrender anything in favor of any other measure, whatever it might be; and it required a compromise. So I went to see Governor Cullom, who was later elected to the Senate. I had no thought of his being elected to the Senate then, but I wanted his assistance in behalf of the enforcement of some State laws here, and some amendments that were necessary, and he promised to do what he could to not only enforce the law as far as he was concerned, but to see that there were men whom we could trust on the commission. And so he was elected to the Senate, and went down there and got the Cullom bill through, which was a compromise measure, and therefore not such a measure as we would like to have. We have not made much progress with it. It is admitted that the bill is not what it should be. Some say it is worse than nothing. A good many people have lost confidence, and say it is worse than no measure at all, but I do not think so. I think it is a step in the right direction; it only needs amending to make it effective. I am inclined to believe that if the railroads are allowed to pool and to then put on a pressure proportionally to regulate them properly, we have accomplished about all it is possible to accomplish in that direction.

Q. Would you give the Interstate Commerce Commission more power?—A. More power, yes.

Q. And in that way you think the law could be made effective?—A. I think so. Q. As I understand, you have not a pure-food law in Illinois that covers the entire ground?—A. No, we have not. We have a butterine law.

Q. I want to get your opinion on that subject as far as you have gone.—A. I think our pure-food laws are not what they should be. Even the butterine law is not what it should be. The packages are not marked on the table of the man who consumes them. The boarding house does not mark it, nor the hotel man. He puts it on his table and people eat it. They do not know what it is. So the law falls short in that. While it compels the large package to be marked, it is not marked when it is on the table, or the bill of fare. It is an injustice to the consumer. I believe in the protection of the consumer as well as the producer of farm products.

Q. (By Senator KYLE.) What do you think of the advisability of a national pure-food law?—A. I think it is a very good idea, and should be favorably considered by Congress.

Q. (By Mr. A. L. HARRIS.) Are you acquainted with the provisions of what is known as the Brosius bill?—A. I read it, but I have forgotten its terms.

Q. Putting the matter in charge of the Department of Agriculture?—A. Well, I would want to think of that. I would want to know what effect it would have.

Q. Have you anything to say in regard to the operation of the present laws of the different States to prevent the spread of disease among domestic animals?—A. I know something of the laws. I am not perfectly familiar with them. I think some of the laws in some of the States are rather arbitrary. The theories of the veterinary surgeons are dangerous, and I think the lawmakers ought to go very slowly in condemning the animals of farmers on the theory of some veterinary surgeon that they have some disease that may be tested by something of their own preparation, and on the strength of that destroy animals without due compensation to the owner thereof.

Q. Is there any uniform law on the subject of the spread of disease among domestic animals?—A. I do not know of any national law, and I do not think there is any uniform law. One State may have a very severe law, and another may have no law at all. They ought to have laws to regulate those subjects. When contagious diseases get into this country, they are not as dangerous as they are in the older countries. Where stock and cattle run out and have free access to the pure atmosphere of the country there is not so much danger in contagious diseases. Pleuro-pneumonia, for instance, is generally confined to animals kept in stables.

Q. Did you mean, when you said the earnings of capital in agriculture were 3 per cent, 3 per cent net or 3 per cent gross?—A. Three per cent net.

CHICAGO, ILL., August 10, 1899.

TESTIMONY OF MR. SAMUEL H. GREELEY,

Commission merchant, Chicago, Ill.

At a meeting of the subcommission on agriculture, in Chicago, Ill., August 10, 1899, convened at 2.40 p. m., Mr. A. L. Harris presiding, Mr. Samuel H. Greeley, being duly sworn, was examined touching agricultural matters, the topical plan of inquiry on agriculture being followed:

Q. (By Senator KYLE.) You may state your full name, residence, and occupation.—A. Samuel H. Greeley; residence, Chicago; commission merchant.

Q. How long have you been engaged in that business in Chicago?—A. Seventeen years.

Q. What has been the nature of your occupation during that time; have you been an independent buyer and shipper?—A. No; I am a commission merchant.

Q. Not in connection with the elevator companies in the city?—A. No.

Q. Are you a member of any elevator association?—A. No.

Q. We would like to hear from you in regard to the agricultural interests of the West, particularly what you know of Chicago as a grain center, the growth of Chicago as a grain center, and the effect of the elevator system here on the agriculture of the Northwest. You will begin and tell all you know about it in your own way.—A. Well, gentlemen, you naturally know that in making this statement to you it will be necessary for me to give my opinion in reference to certain things as I view them myself. Whatever that opinion may be worth, coupled with what facts I will state, is for you to judge. But I will say that we have reached a time in the history of the commercial interests of this city in reference to grain where the natural supply and demand, and those conditions which would naturally affect the market, no longer control prices. Values are controlled by an artificial organization, which includes four distinct systems. Of first importance we may mention the railroads; secondly, the public warehouse; thirdly, speculation; fourthly, bucket shops; and I might add a fifth, which is the ownership of private cars by individual firms operating through railroad companies.

In order to properly present this before you, I will first take up the feature of the warehousemen, and endeavor to state as nearly as possible when they were created and for what purpose. About the time the interstate-commerce law was enacted there was a system of rebates, in my opinion, extended by railroad companies to individual shippers, to bring grain to this market in order to meet competition to various other market points in the country; but the interstate-commerce law operated in such a way, in their opinion, that it became necessary, in order to protect the hauls on their systems, to put the rebate in the hands of favored individuals whom they could trust. In searching around for those individuals, they found that the party to whom they could give the lowest rebate and still bring the grain was the most desirable man to receive it. Therefore, they chose the public warehouseman, gave him an elevator on their right of way and favored him with facilities to draw that grain here; and in my opinion he received all the advantages that were given at about the time that law was passed, and receives them to-day.

Q. What date was that?—A. That was about 1887. The grain emanating from Nebraska and Kansas might be competed for in several directions; but rather than let that grain get away, for instance, at Omaha on an 8-cent rate, they gave a cut rate to a party who could give them the benefit of the long haul on their system to bring it to Chicago, preferring to give a cut rate on the entire system and thus net

them perhaps 20 cents a hundred, rather than let it get away at Omaha and get into the possession of another road and only net them 8 cents a hundred. The public warehouseman was appointed a secret rate getter, he was appointed the secret facility man, inasmuch as these public carriers gave to the elevators facilities on their roads to compete with the public in drawing grain from the West. The advantages of a man having possession of a public warehouse were that, in competition with the public, he would pay no storage whatever on grain. In other words, of the three-fourths of a cent charged to the public for the first ten days' storage, the public warehouseman, being the proprietor, would pay nothing. If he paid storage, he paid it to himself, which was equivalent to no storage. Now, if the railroad were to give a rebate to any man, it was only necessary to give this three-quarters of a cent to the public warehouseman because he got that advantage in storage. There is one place where the public warehouseman necessitated a less rebate than any other man that could possibly handle that grain. In other words, possession of the elevator acted really as a rebate in the freight. In addition to being able to carry grain in the public warehouse without paying the storage charge, the public warehouseman was able to select the best of a certain grade and keep it for himself as a merchandiser, and he could give the public the poorer of the grade and thus keep the public at a disadvantage at all times in the merchandizing of grain through the public warehouse. Those two points are of very great importance when we stop to consider that last year this city handled 300,000,000 bushels and over, making nearly 300,000 carloads of grain, and a large proportion of it passed through the public warehouses. This system of putting transfer facilities into the hands of a private individual in competition with the public gradually assumed such proportions that the shipping interests from Chicago to the East on the part of the public are what you might term absolutely dead. And that is the condition to-day. It also reflected upon the receiving interest from the West, because the advantages that the public warehouseman received from being able to store grain without charge and to mix grain and receive large benefits therefrom enabled him to give away a portion of those advantages in competing against the public. This condition has gradually increased to such importance and such proportions that to-day we find practically one set of buyers on the Chicago market and one set of sellers to Eastern markets and for export, those men being the men having these facilities from railroad companies or engaged in a business in a general sense similar. So that we find ourselves competing with one buyer on the Rock Island, perhaps one, two, or three, not over that number, a very few, on the Northwestern, one on the "Q," one on the St. Paul, the railroad officials granting these privileges to each particular warehouseman, giving him in many instances facilities, as I have referred to, for doing business in competition with the public. That is leading up to a state of affairs where the producer in the country is going to receive one price for his grain from one man, and which is going to kill general competition. It is leading also, and very rapidly, to the time when the buyer in the eastern and the Chicago market is going to get one price from one man. When I say one man, I refer to that combination. Each individual railroad has a man having these facilities, and this practically amounts to one set of men operating on similar lines on different railroad systems. This not only kills the competitor for the grain in the West but kills the number of men who have grain to offer from this market for the East, and it carries with it a very important effect on the values of grain. Fortunately or otherwise, the grain of the country is a speculative commodity. It is subject to sales for future delivery and purchases in the same manner, which have finally distorted themselves into a condition of affairs possibly favorable and possibly unfavorable to the producing community; but to explain how that speculation affects the values of grain, I want to state that the public warehouseman carries grain in his warehouse to accumulate storage charges. His object is to put it in there, to get possession of it himself, sell it ahead for future delivery, and the difference between what he pays for it and what he can get for future delivery, less incidental expenses, is his storage charge. They are willing to sell that grain for future delivery at a lower price than any other man connected with the general public could himself carry it and pay the regular advertised rates of storage. In that way he succeeds in retaining possession of the property. Then in retaining possession of the property, he continues to sell it from month to month for future delivery, and by the speculative public taking that grain of him at the price at which he is willing to make the future sale, the warehouseman simply waits until the time comes for the buyer to sell that property out. He is standing ready to take it of him and sell it ahead for another deferred delivery and thus accumulate another storage charge. This has produced what you may term an endless chain of forced liquidations on the part of buyers in this market. Not only do they, the warehousemen, carry this grain for storage, but they so manipu-

late the grades of the grain in store by reducing the quality to what is termed the line grade, or just such a poor grade or good grade as will just pass inspection, reduce it to such a low level that the man who buys it for future delivery does not want it as a merchantable commodity, and he sells it back to the warehousemen, thus continuing its life in storage and tax on the public. Now Chicago has probably in public and private warehouses over 60,000,000 of bushels of capacity; and I believe that I am not far from the truth when I say that the larger proportion of this capacity is operated on this same basis of making storage charges out of the speculative public.

Q. Accumulate, as it were, so much funds in bank upon which to draw interest?—A. That is it, exactly. Then when this forced liquidation takes place, as I said, these men are ready to stand by and take it and sell it ahead again for future delivery. These storage charges which these public warehousemen make are not the only storage charges that are made from the speculative public which buys the grain, but an indefinite amount of grain in the country in store is also sold in this manner; and the result has been that in 15 years the storage charges, amounting, I should say, on an average of at least 6 cents per bushel per year on the enormous quantities of grain which have been sold in this market from month to month for future delivery, have so worn out the speculative public until it no longer exists except in a moderate way. Therefore it puts the control of the market into the hands of the men that hoard these vast volumes of grain. It will be noticed that being carriers for storage, one prominent point always arises before them, and that is, the lower they can get the prices of the product, the more money they make, because the less insurance and interest to carry the stuff. It is more to a man's profit to carry wheat and sell it ahead from year to year to the speculative public at 50 cents a bushel than it is to sell at \$1 and pay interest and insurance on dollar goods while carrying, until the buyer gives up.

Q. Storage charges are always the same?—A. Storage charges never disturb the prices. The speculation on the board where the markets of this country are made is getting to a very low ebb. The general speculative public have caught on to the game, and they are getting out of it. Now, then, they have got just about enough trade left to properly hedge what they carry—in other words, to sell against what they carry. They can not succeed in getting an overplus of buying and speculation to come in and maintain prices. So that we have arrived at a condition where there is not buying enough—enough trade in the speculative grain markets, over and above the amount of cash property for sale, to carry the market against the current which they produce. In my opinion these public warehousemen and some private warehousemen, as carriers of grain, store up these hoards on this market for the purpose of not only hedging their grain, but otherwise freezing out the man who buys the stuff. Not content with getting a commission of the man who buys, they go after all the money he puts up to secure the deal, and freeze him out, because, when delivery day comes, these buyers see these vast floods of grain right here for immediate delivery all carried without paying a cent of storage by the man who is given facilities by the railroad company. If the public warehouseman were not a great dealer, this grain would never be carried in Chicago and pay these large amounts of storage, and act as such a club to batter values.

Q. Then what would be the condition?—A. Then, when grain got so low that it looked like a purchase, and the grain was not in hand, but in the invisible supply in the hands of the farmers, speculation would come in here and not have starting it in the face the enormous quantities of grain hoarded up in storage. In my opinion this condition led up to the panic of 1893. It was one of the important conditions that led up to such a reduction of the values of grain that people became ready to repudiate their debts. That is one circumstance connected with the market in this city; but we must not overlook the fact that these facilities are given to public warehousemen by railroad companies to protect the railroad companies, in my opinion, from grain being attracted from what they consider their legitimate territory to other territory. I believe, as the elevator men have often said in their discussions of this subject, that the system of through billing that has been established and all these matters have combined to make it necessary, looked at from their standpoint, to protect their railroads; but at the same time they are so endeavoring to protect their railroads they have produced the condition to which I have referred. In my opinion it is almost impossible to properly conduct the grain business on the railroads in this far western country without special rates to give the railroads what is their proper haul. But there is a question in my mind as to what they consider a fair proportion of the business. It seems to me that if the Gulf or the Northwest or any other geographical condition should arise that makes it possible for a Gulf shipment to take a

lower rate than a shipment via Chicago to the seaboard, it would simply be the misfortune of the railroads that run through Chicago.

Q. In regard to this class of elevator men getting rebates from the railroads, is that a surmise on your part or do you speak from your actual knowledge of the matter?—A. The elevator men get rebates from my actual knowledge in this way, that the railroad company gives the facility to a warehouseman, which puts him in possession of a warehouse where the warehouseman pays no storage. It is a portion of the railway facilities. They have no more right to give a public warehouseman a place to store grain there and charge me for it than they have to give a man a place in the freight house to store a piano and charge me \$25.

Q. They give such facilities, do they?—A. They do; yes. Neither have they the right to give a man such a place as will permit him to mix his grain with mine or keep mine and his separate and compel me to take any sample they are a mind to give any more than they have to take a freight house and have 1 stove belonging to me and 1 to some other man and 10 to some others and mix up the stoves and give me any stove that the man in charge of the freight house may see fit. I desire to have my own personal property preserved as far as possible.

Q. What was the function of the public warehouse as to those products as originally intended?—A. It was originally created for the purpose of handling the grain of the public by mixing in all samples of the same grade as they happened to come in, in the same bin, thus in reality insuring an average quality of that particular grade to those desiring to take such grain from storage.

Q. So that, under those circumstances, you would not get your own grain specifically?—A. Not specifically; but I would get a fair average. I will admit my illustration of the stoves was somewhat stretched, comparatively.

Now, if you will permit me, I will refer to a condition affairs which has not been very thoroughly discussed, but which to my mind is a very important factor to the grain producers of this country, and that is the existence of bucket shops, in this way: The bucket shop is a place where people can go for the supposed purpose of buying and selling grain, and which in reality is a place in which a bet is made with the proprietor as to whether the price shall go up or down, the winner to take the profit and the loser to pay the loss.

Q. A good deal like bookmaking on a horse race?—A. Somewhat. It is distinctively a brace game, inasmuch as the man who is the customer puts up his money with the man with whom he makes the bet. To that extent it is a brace; at least, one party to the bet has the money. The larger per cent of dealers in bucket shops are supposed buyers of grain. I want to call particular attention to that, for the reason that when a man supposedly buys grain in a bucket shop, there places his order, it does not enter the general market and have its influence on the prices where the values are made. I should judge that from 75 to 90 per cent of the outside trade that goes into the bucket shops is purchased business on the part of the customers. I believe bucket shops are successful as profit-making institutions, and I believe that their success as profit-making institutions is and can be nothing else than the depression of the price. Now what makes it possible for the price to be depressed? That reverts right back to the privilege granted by the railroad company to a public warehouseman to store large quantities of grain on the Chicago market. That condition operates in the bucket shop to the detriment of the purchaser there, as it operates on the board of trade to the detriment of the purchaser there also. Therefore, indirectly I claim that railroad companies are largely responsible for the success and existence of bucket shops, owing to the fact that such large quantities of grain are bought in bucket shops in this country, and the market therefore so seriously affected; that railroad companies are one of the most potent factors in the consideration of the welfare of the producers of this country. Now, what would happen if the bucket-shop proprietor took as many chances as the man who bought the stuff? In other words, suppose this large quantity of grain did not exist. The short seller or the bucket-shop proprietor would find himself subject more to the natural conditions that make a market, and you would see more frequent rallies because these volumes of grain would not exist here, and it would force bucket shops out of business, the short side being unsatisfactory. Not only do bucket shops assist in killing buying speculation with the assistance of these conditions, but there is born out of this public warehouse system another very serious menace to the wealth producers, and that is the professional bear speculator. He is encouraged on the same lines held up, as I have represented, in favor of a bucket-shop proprietor. It operates very much in favor of the short seller, the large volumes of grain, the storage charge fixed as a tax on the man who buys grain for future delivery, forcing the man who buys it to pay a constant premium for the property, and all these hoards together, with the mixing of the grain to such a low ebb that the speculative public does not want to take it when

the delivery day comes, make a bad condition in this market, notwithstanding a condition of general business prosperity that should naturally put the price of grain from 10 to 20 cents a bushel higher.

Now, I have taken up railroads, public warehouses, and bucket-shop speculation. I invite you men to take a trip to the Board of Trade and examine for yourselves upon which side of the market the preponderance of speculation exists; and I believe you will find that it is the professional raider and warehouseman against the outside buyers; generally men who come in and want to buy and make up what we term our bull trade; but they are continually up against it, for, as I say, if this quantity of grain did not exist, these men would not dare to sell these millions and millions of bushels short in those pits, because they would never know where they would get it; but being here, the weight is so heavy that the man who buys it is forced to run.

I want to call the attention of this committee to another condition that exists in the trade, and that is the ownership of private cars, with which, no doubt, you are all familiar. I believe there is one man in the city of Chicago that owns between ten and twenty thousand private cars, and who can lose money in the merchandising of his property and still get enormous profits from the railroad companies on account of this special facility granted him. If \$15 is paid a man for the use of a private car on a railroad system for a round trip to New York—a freight car that he owns—as against the general public, which receives nothing for such a haul, the public is out of business in anything that that man attempts to deal in. If there is any recommendation to be made on any condition that exists in this city or throughout this country, I know of no other more important than this growing custom of the ownership of private cars by private individuals and corporations. A public warehouseman has no more right to deal in grain in competition with the public—and pay no storage on his grain, and have the privilege to mix his grain—than the collector of the port of New York has to engage in the tea or coffee or silk business in competition with Marshall Field and Sprague, Warner & Co. How long would the people of this country stand it if he should pay no import duty or should pay below full tariff rates? But an exactly similar condition exists right here in the handling of these cars. I would like to know how long the commercial interests of this country are going to stand it for a railroad manager to be able to dictate what rate of freight I shall pay or what rate of freight my competitor shall pay, and be able to make or unmake almost any business man or almost any community. That is the condition in the grain trade to-day.

Q. Do you regard a stable rate as the essential thing, whatever it may be?—A. Whatever it may be, it must be a stable rate, as stable as it is possible to secure.

Q. And the same to everybody?—A. The same to everybody, but that will never come until the Government owns the railroads. If the railroad companies of this country were permitted to pool, as they desire, by any legislation, how would that prevent cut rates? How would it prevent any man from receiving special facilities in the way of warehouses? There would be no protection. As long as it is possible for a railroad official to divide a rate with the man to whom he gives these facilities, which in my opinion exists, I do not believe it is ever possible to have general competition for any commodity in which those men divide the rate. I believe that has existed in this city between public warehousemen and railroad officials, and I believe it exists to-day, but I can not prove it. I could not tell you how it is paid; I believe it is done. I do not know how it is done, but I have an indefinite amount of evidence that leads me to believe that these men are very close together.

Q. Would one evidence be the fact that a great many enterprising buyers on the outside have been driven to the wall?—A. Oh, they permit it and are willing to permit it, and the more they drive out competition the better the railroads seem to like it; and the public is treated with the utmost indifference in regard to getting redress. The railroad men recognize the warehousemen, and the general public cuts no figure. I have served on committees and I know all about it. This condition has taught the eastern roads a lesson. I have been referring now to the roads entering Chicago from the West; but we have already noticed in our trade that the eastern roads have placed their transfer houses, some of them, in the possession of a grain dealer. Now, for instance, I get a car in here on the North-western road and I want to ship it to New York. I order it to the Lake Shore and Michigan Southern Railway Company for transfer to the eastern car, to go east in the regular way. It is transferred through the Lake Shore transfer house. But instead of the Lake Shore road operating that transfer house for the interests of the public, they place a grain dealer in there who transfers my grain; and they have clipping facilities in there; and if I desire to have my oats clipped my competitor clips my oats; he turns out my product for me, and to the best

of my belief he knows the destination of every car that goes out of that clipping house, or can if he wishes. What show have I to do business in the East? That exists on the Lake Shore; it exists on the Wabash; it exists in the Pennsylvania transfer house. What is this market coming to for competition and open trade? We are narrowing right down to the man that is right next to the man that runs the road. He gets the rate and does the business. Speculation is becoming dead; prices are suffering in consequence; and when I say suffering in consequence, you can see the condition here. Grain for December delivery now down in the twenties, in the neighborhood of 28 cents a bushel, and not a kernel of it out of the ground; and they had September oats selling in Chicago at 19½ cents a bushel before the crop was hardly planted. Almost absolute safety is guaranteed the short seller in pulling out these sales by the conditions that have been made possible under these existing circumstances. When you stop to consider that we raise in this country in the neighborhood of 3,500,000,000 bushels of grain annually, worth even at these low standards of value between \$1,000,000,000 and \$2,000,000,000, and that it is possible for a system to be inaugurated that will put half a dozen men into such power that indirectly they can make the prices, and the lower they make the prices the greater their profits, it is time legislation took place somewhere. I challenge any member of this committee to obtain a state of facts that will truthfully deny what I have stated. I do not think you can do it. I believe you can summon witnesses and procure evidence and get a basis for a report that will serve as the greatest argument before the people to-day as to why the railroads should be under Government ownership.

Q. Your idea is that they should come under the ownership of the Government. Is there no way short of that?—A. Thus far we have taken up the conditions; but I myself feel far from capable of even making suggestions in regard to the remedy, that is, any immediate remedy. This question has been too largely discussed in regard to not only grain but to merchandise, and the conclusion we all reach is about the same; but as to the remedy, I do not see how it is possible to ever have a remedy until the people are educated to a sense of duty, and to the recognition of the existence of a system of civil service that shall be perpetually known to be a success, and then grapple these questions; until we feel that we can intrust these things into the hands of men who are perfectly competent; and it seems to me that time will only come when we have tried a system of civil service and know it to be a success. But the idea of attempting any of these gigantic undertakings, when we absolutely refuse to adopt the system of civil service, seems to be absolute folly and incongruity. That seems to be quite a different thing.

Q. Would any national legislation, amendments to the interstate-commerce law, suggest themselves to you?—A. I listened to Chairman Knapp the other night at the Auditorium, where he favored railroad pooling, and I have also listened to very able men, notably Secretary Stone, of the board of trade, a student opposed to that idea; but I do not seem to believe that they can ever rectify this matter by any system of pooling as long as one man has the power to make a rate to an individual. I do not believe we can ever rectify it as long as that exists, because I believe human nature will be tempted, and see so many good things in the granting of special rates that they will be after the money. But I believe, under Government control, properly administered, with a high moral spirit of the people intending to see that it is properly administered—until that spirit is awakened I do not believe we will see any good result.

Q. Did any good result from the decision of the Supreme Court declaring this amendment to the law of 1871 unconstitutional?—A. I do not believe that cuts any figure. The condition still exists where a man can name the rate.

Q. The public warehouse will be a thing of the past, then?—A. I think so. I think we will see the time before a great while when every man can put his grain through the public warehouse at the same cost. This temptation put into the hands of men conducting public warehouses has led up to some of the most gigantic, I might term, robberies known in commercial life; and I would be delighted, if it would do any good, to furnish this committee with a little information on that subject at some future time when they are at leisure.

Q. (By Mr. CONGER.) Who was robbed?—A. The public.

Q. And was the public in this case the consumer or producer, or somebody else?—A. General trade; and it had its influence in affecting prices at that time, and at other times, and all times. I believe there is a continued system of underhand shady business on the part of at least a portion of these warehousemen. There is something, if the truth were known, that is absolutely abnormal; and there are certain things that can be shown to have existed in the past, and I think they still exist, with which the matter of rate cutting is on a par, to say the least.

Q. Can you be a little more specific and say what these are? Do they consist in manipulating the grade or short weights, or how?—A. I believe, from my experi-

ence, that there is a great deal of shady influence attempted on the grading of grain.

Q. Is that at present done by State officials?—A. I don't think it is done on the part of the State officials. I think it is done on the part of the elevator proprietors. I think they use the influence; that is my opinion. I do not believe it is possible for a man to be the custodian of the people's property and his own without the temptations being so great as to lead up to a great deal of shady work.

Q. By shady work you mean manipulating the grades and weights?—A. Manipulating the grade and weight and attempts to manipulate inspections, and attempts of various kinds, and our commercial life here is very unsavory with the odors of what has taken place within the past few years.

Q. Earlier in your testimony I think you said that the elevator capacity of Chicago was about 60,000,000 bushels?—A. Public and private.

Q. What portion of that is public and what portion private?—A. Well, I should say they were about all private, the way it is managed. It is almost impossible for the public to do anything in a public warehouse, but the capacity of those which are advertised as public, I should judge, is in the neighborhood of about 20,000,000; without being particularly informed, I should judge so.

Q. About how many of the public elevators are there, and are they increasing or decreasing?—A. They are decreasing. I believe the railroad companies are assuming the position—some of them are—that they will furnish no facilities for the public—do not intend to give the public facilities—do not want the public to have any. I believe we are reaching a time when they want favored parties to do the business on their lines. It looks that way; everything points to it. I believe the stockholders suffer and the officials divide the swag. That is my opinion. I do not care particularly about going on record on all those things, but I have no objection to it.

Q. You stated earlier in your testimony that because of being compelled to pay a smaller elevator charge the public warehouseman who was purchaser of grain was able to pay more to the farmer than the others?—A. That is true.

Q. It would seem at first glance, at least, that if he was obliged to pay more this arrangement was for the benefit of the farmer.—A. That is the one, sole, solitary foundation point that these men have rested on in all their trials and tribulations in court and before our representatives in Springfield. That was, that they paid more to the producer. They will go out and give away a portion of their storage as against me and gain possession of the grain. That is all they want, just to be enabled to get possession of it. But where they pay that amount to get possession of the grain, they bring it up here and hoard it and take from 5 to 10 cents a bushel off the entire crop.

Q. The remedy for these evils is what we are particularly interested in. Have you something to suggest in that line?—A. I think the first remedy would be to take those fellows down to Springfield and choke them off. That would be a good start. I believe enough money was spent down there to overthrow the decisions of our courts, and I believe that the legislation they secured was all done through the use of money. That is another one of my opinions which I believe is quite generally accepted by men who were there.

Q. (By Senator KYLE.) Are the branch elevators, small elevators, through the West and Northwest branches of these great central elevators?—A. They are becoming so, I believe.

Q. Simply buying houses, supply houses?—A. I believe these men here are gradually securing possession of private warehouses in the country, where they propose to buy direct from the farmer; and I believe that will eventually lead to the larger owning of what are termed line houses on the different systems where one price is made to the farmer, as I understand the condition exists in the Northwest.

Q. We have 3 or 4 companies that operate, as a rule?—A. It is not always necessarily limited to 1. There is generally enough business to distribute between 3 or 4 or half a dozen.

Q. Do you think there is any collusion?—A. Oh, yes; I do, most assuredly. I see that here every day on our market; five of them get together and make a price every day.

Q. These warehouses get together and fix a price and that is sent out?—A. These warehouses get together and fix a price and that is sent out to this grain trade. I believe men are buying grain right along west of the Mississippi, where they pay the freight to the Mississippi, and we pay the freight right to Chicago. This is an advantage of a cent a bushel. They pay a cent a bushel more for Nebraska grain than they do for Iowa, to get possession of that far-western grain which is likely to slip off somewhere else, and they bring it here and make money, train loads, store it here and sell it ahead until your trade has gone to blazes. As soon as they get it they jump into a pit, sell it ahead for future delivery and

make a hedge, and then some other fellow is carrying that and paying storage charges, and they just wait until he is dead and then they look for a new sucker.

Q. I gather from what you have said that this storage charge is the great evil. What has the tendency been in recent years; are these charges more now than they were a few years ago, or are they less?—A. Well, I don't know as you correctly represent me in stating—unintentionally, of course—that the storage charges are the chief detriment. I do not object, or neither does the public, I take it, to paying storage on grain held in an elevator at a reasonable fair charge, but it is a fact that one grain man can get that storage free of charge; that is the evil, among others.

Q. And that man a competitor?—A. That man is in the grain business. He is not a custodian appointed by the State and licensed to be the custodian of the public's property, which was the original intention of the law and constitution of our State, but he overrides the law and becomes a merchandiser, and then he can hoard up these storage charges.

Q. (By Mr. CONGER.) What are these charges now?—A. Three-fourths of a cent for the first 10 days, and one-fourth of a cent every 10 days thereafter.

Q. Do you know whether they are greater or less than they were?—A. Less. I think they are lower than they ever have been. One of these fellows can take grain and transfer it from the car into his elevator, into another car, and do it for a cost, in my opinion, not to exceed \$2 a car of 1,500 bushels. The public pays three-fourths of a cent a bushel, or \$12; and I pay it to my competitor in the grain business, and the railroad gives him an elevator to do it; but he don't want to transfer anything through there until he has to do it; he holds it there and makes this storage charge year in and year out, and lets these bear speculators hammer the values, and thus assist him to freeze the buyers out and continue the grain in storage.

Q. Would it not almost seem that if these elevator charges have been growing less, and these elevator men pay more to the producer than the independent grain dealers are able to pay, that those who are injured most, at least, are the independent grain dealers here in Chicago?—A. The man that is injured most is the man that raises the grain. If we had a free, open market here without these hoards of grain, our values would be 15 to 25 per cent higher. It is proved so. You and I remember the time when it was a novelty to see wheat much under \$1 a bushel and corn 40 to 50 cents and oats in the forties and thirties.

Q. Your idea is that these elevators and the manipulation of them has had most to do in bringing about these results?—A. Yes; they are killers of competition. What was corn of late years in Nebraska?—8 cents a bushel. Oats at 13 cents in Chicago—and these fellows are and have been hammering away and selling everything until the producers in the West get nothing for their product, and then they yell the money question. If you will look into the face of Phil Armour—he is the high cockalorum among those who are stifling competition and depressing prices in the grain trade—the chief of the whole outfit; he is the representative of cheap-rate getters; he is the champion highway robber of America, and I can prove it, and he knows it.

Q. (By Mr. A. L. HARRIS.) Is the price of grain fixed in Chicago?—A. Yes; I believe that the prices of the crops of the world are largely made right on that floor, and largely controlled through the influence of one man.

Q. Then the idea is not true that Liverpool is the market of the world for the crops of the United States?—A. No; I said in the commencement of my remarks that I no longer considered the legitimate supply and demand as a factor.

Q. By what authority do you make that statement?—A. By the authority of the knowledge of those conditions I have just stated.

Q. Of course, you have kept track of the price of grain in Liverpool?—A. No; I am not familiar with it, because I am not an exporter, and my knowledge of the foreign markets is somewhat limited.

Q. Does not the price in Liverpool to-day have some effect on the price in Chicago to-day?—A. I believe it has, but I believe Chicago is in the lead—is the leader.

Q. Do you mean to say that Liverpool fixes her price after Chicago?—A. No, I do not say so; but I believe the general trend of prices of grain are made on this floor.

Q. In treating of the Board of Trade, what effect does a rise in the price of wheat in Chicago have during the hours of trade?—A. It generally calls forth a new army of those short sellers, to weigh it down again from where it started. If I answered that without any attempt at jest, I believe a rally simply calls forth another army of sellers. It is such a novelty now to see a reaction or a little rise that we welcome it very freely—the men that are favorable to a better condition of affairs.

Q. I was under the impression that if we had 100,000,000 bushels to export, and with that 100,000,000 bushels on the boards in Liverpool, or any other amount, it substantially fixed the price in this country, less the carriage and commission.—

A. Well, it is the overplus of production, in regulating the price, that is more or less of a consideration, but only secondary. Now, I will call your attention to this: What has the Liverpool market to do with the price of December corn to-day? The corn is not out of the ground. How much of the new crop of corn do you suppose Liverpool has bought? But here they have raided December corn from 35 until it closed at 25 here to-night. I will admit that I think the foreign demand is a factor in the markets, without any question, but I believe that foreign demand could be absolutely encouraging to the producer and every condition suggest higher prices, and the markets here go all to smash right in the face of it. Not being so conversant with foreign trade, and confining my business almost entirely to the operations in this country, I can not give you very much information on the foreign situation. I believe you could get evidence on that question to show that a firm demand did exist on the other side and that prices were very materially depreciated here at that time. There might be a good foreign demand at a particular time, and still there might be some local condition here that would depress us.

Q. (By Senator KYLE.) Is Liverpool given as the export point?—A. Why, you have cash grain being bought by everybody that can get hold of it. Our September corn is at a heavy premium over the far-away futures. Our cash grain premiums over September. Our very poor grades are selling at a par with the best grades on account of the demand, and here we have a weak market to-day; that is, the general markets are very heavy indeed. It shows the influence that can be brought to bear by these speculators on the futures, regardless of the cash price—of the supply and demand; they can win every bound here when the markets go down. They are the establishers of the future prices.

Q. What do you think about that?—A. I believe speculation in grain is a good thing, because when it gets too low speculation will come in and take it as an investment: outside investment will take it; money will take it; but I want the conditions on the market as favorable to the man that buys the stuff as it is to the man that sells it. The buyer is handicapped in every way by these conditions I have enumerated. The board of trade is all right in itself. It is an institution organized for the dispatch and convenience of business. As far as that goes it is all O. K., but it is the system that has grown up within the board, which is not, as a matter of fact, a part of it. The murderers of competition and speculation have created conditions that hurt business and hurt producers. I believe the time is not very far distant when you will have no general competition in grain. I believe there will be one price sent out from every railroad by one man, or a favored man who has the power, and that will be a dangerous speculation; and speculation will be killed just as it was in oil, and that floor will be deserted up there and the building sold to protect the bondholders.

Q. (By Mr. CONGER.) Would not that be a good thing?—A. No. You must make the conditions natural. We have had an open market there, but when we get the conditions good—our laws executed—we will be all right.

Q. (By Mr. A. L. HARRIS.) You speak about legislation. What legislation is necessary to do that?—A. In relation to legislation against the railroads I do not feel competent to speak, because I believe that that is for far wiser heads than mine to treat of; I am a young man and something of a novice. But I believe that there ought to be national legislation to prevent the existence of a bucket shop. I believe that is one of the greatest remedies that can be possibly found.

Q. (By Senator KYLE.) That is one of the features of the Hatch-Washburn bill that was before Congress?—A. That has been passed upon, but I take exception to many on that subject. I am no friend to anything but what I consider is for the interest of the producer, and I do not care whether speculation is abolished or not, although I am somewhat interested in the attack on that kind of business. But, as I say, speculation in grain is all right if the man that buys it is on an equal footing with the man that sells it in the market; but where there are conditions that are absolutely crushing the men that are selling the goods, it is an evil, and these railroads, bucket shops, and public warehouses, I believe, should be legislated upon so as to make it impossible for the bucket shops to exist in this country, and that legislation enforced.

Q. You think that in order to make the business live in this country you must have equality, an equal basis in such a case?—A. If we are on an equality with things that are public we do not fear competition, but where it is possible for one man to pronounce an edict whether or not I shall be living a commercial life it is time to make a protest; and that condition exists right here.

CHICAGO, ILL., August 11, 1899.

TESTIMONY OF MR. BERNARD W. SNOW,*Statistician of the Orange Judd Farmer, and member of the commercial staff of the American Agriculturist and of the New England Homestead.*

At a meeting of the subcommission on agriculture in Chicago, Ill., August 11, 1899, Mr. A. L. Harris presiding, Mr. Bernard W. Snow, being duly sworn, testified as follows:

Q. (By Mr. A. L. HARRIS.) Please state your full name, your residence, and occupation.—**A.** I am statistician of the Orange Judd Farmer, and also a member of the commercial staff of the American Agriculturist and New England Homestead. My name is Bernard W. Snow; and residence, Chicago.

It seems to me that the results that have come to our export trade in meats, through the operation of the laws requiring inspection and branding of meat products intended for export, have been so entirely satisfactory in the way both of increasing our export trade and of removing the prejudice which existed abroad against our meats, that the time has come when it would be wise to increase the field of operation in the matter of inspection. At the present time we inspect the meats that are prepared for export not only to those countries that require it, but to other countries as well; and it has resulted, as I say, in removing some of the prejudice against American meats, and also in encouraging the trade in American meats in those countries where the inspection was not required. At one time this country enjoyed a very large and growing export trade in dairy products, especially in cheese. That trade has been almost entirely destroyed. It has gone down to a very small figure now, on account of the shipment of products as cheese which in reality were filled cheese, the natural fats being taken out and replaced by different forms of cheap greases. The boards of trade of England, and of Liverpool especially, where a very large part of that trade once centered, protested a number of times against shipping as cheese products those which were really imitations; and it seems to me that in order to regain that trade and enlarge it, it might be well to authorize the Bureau of Animal Industry to inspect all dairy products offered for export trade at the export points and brand them for exactly what they are, and perhaps establish certain grades as export grades and brand them, so that the purchasers abroad of these products would have the guaranty of the Government inspector that they were getting exactly what they call for.

Q. (By Mr. CONGER.) Are you familiar with the recent efforts of Secretary Wilson to promote the exportation of butter?—**A.** Yes; I am in a general way. I have talked the matter over with Secretary Wilson, and I believe that he has done there a magnificent work, and that it should be further supplemented by a provision that would authorize him to have such goods inspected and branded for what they are before they are shipped.

Q. Do you know if results have followed those efforts? Are we exporting butter to any extent now?—**A.** The effort has been recent and is continuing yet, so that it is hardly time to show up largely in trade returns, but my impression is that it is increasing the trade to some extent.

Q. And your idea is that an inspection of cheese products would help those products?—**A.** That particular product, and it might be extended to a number of other products. Now, for instance, recently the German Government has raised objections to the importation of American apples on the ground that there was danger of importing the San Jose scale with the fruit. If that is carried out as part of the agrarian movement, it will amount to cutting off a very considerable part of the foreign market for American fruit. I have no doubt that if our products were honestly inspected by the Government inspectors before they were shipped it would remove the ground for that prejudice.

Q. Is it possible to detect the presence of the San Jose scale in examining an apple?—**A.** Yes, by an expert.

Q. Have you any other particular products in mind that would be benefited?—**A.** Those are the most promising export products that we have now. It might be that the thing carried out to its logical conclusion would induce trade in other products to some extent, but at the present time it would be the proper product to begin with.

Q. Your idea is that this inspection should be under the supervision of the Agricultural Department?—**A.** Yes; I think it should be under the supervision of the Bureau of Animal Industry. Of course, with the fruit products that might seem something of a mislocation, but at any rate it should be under the supervision of the Department of Agriculture, and, the inspection machinery all being

organized in the Bureau of Animal Industry, it might be proper to assign it there, and probably would be. Now, I am not certain as to just what regulations the Canadian Government have for the export trade in cheese, but they have a very large trade, starting some years ago. Our trade in cheese was larger than theirs; theirs has continued to grow. Cheese has grown in popularity abroad, and they now do an enormous export trade in cheese, where we do practically nothing.

Q. (By Senator KYLE.) What jurisdiction does the Agricultural Department now have over this export trade in connection with exports of any kind?—A. None, so far as I know of, except in the inspection of meat.

Q. Under what act?—A. The act creating the Bureau of Animal Industry.

Q. Is it not a fact that the Canadians and English both have very rigid rules in regard to the marking of goods, indicating the quality?—A. Yes; that is one thing that I should recommend, that they should be marked for what they are and marked plainly.

Q. Did you examine the Paddock pure-food bill some years ago?—A. I did.

Q. And the bill recently before Congress, the Brosius bill?—A. The Brosius bill I have looked at to some extent, but not closely; I could not call all its provisions to mind.

Q. In your judgment, could not all this be looked after in the bill drafted for pure food?—A. I think it could in a pure-food bill. I single out the export trade for inspection, because at home we have the advantage of State laws to some extent, and there would probably be less objection on the part of manufacturers to branding the goods for the export trade than there would be for the home trade.

Q. What is your observation as to the working of the pure-flour law passed by Congress?—A. There is no question at all but that it has resulted in the almost entire abandonment of the adulteration of flour with corn flour, or the mixing. I think there have been very few licenses taken out by public mixers; and it is my belief that the practice is pretty nearly done away with.

Q. And the Treasury Department have taken off the inspectors, have they not?—A. They have taken off some of them, if not all. I did not know they had taken off all.

Q. What was the reason of that?—A. There was not enough business done by the mixers to justify the expense. I think it has pretty nearly if not entirely corrected the evil.

Q. I would like to know how general the demand and the desire is on the part of the farmers for a pure-food law?—A. There is no question but what the agricultural community is interested in that proposition. It is a matter that has been very largely discussed at the conventions and meetings of their organizations. As individuals I don't suppose that they are any more interested than the general public, or than the city public; but it is a question that is being very largely discussed.

Q. In your judgment, what are the antagonizing influences to the enactment of pure-food legislation?—A. Well, I suppose it grows out of the unwillingness of manufacturers to submit their business to any public inspection. There is no doubt but that there have been organizations among manufacturers in different lines to postpone pure-food legislation.

Q. In Scotland the laws require all these things to be up to a certain standard, and they have a public analyzer, where the consumer can take the article and have it analyzed. If it is not proven to be what it was sold for the party is responsible. Is that the end aimed at, generally, by the farmers of this country?—A. There is no question but that they are interested in that proposition as largely as in any abstract question before them; and it is a question, too, that in the agricultural community there is but one side to. We all favor it. The opposition undoubtedly has come, heretofore, from combinations among manufacturers of products that might fall within the purview of such an act.

Q. (By Mr. CONGER.) Are you familiar somewhat with the existing Federal or State laws to prevent the spread of disease among domestic animals?—A. In a general way. Several years ago, about the time the Bureau of Animal Industry was organized, there was a great deal of pleuro-pneumonia among the cattle herds of the country, and the fear of it had begun to affect our export trade in meats and resulted, I believe, in an English regulation that requires the slaughter of imported animals at a certain point within a very short time. At that time the Bureau of Animal Industry was organized, and an appropriation was made to be expended in eradicating pleuro-pneumonia in this country wherever it had obtained a foothold. Here in Chicago at that time the examinations were carried on by Dr. Salmon, chief of the Bureau, and it was shown that there were herds around Chicago that were rotten with pleuro-pneumonia. In the case of a contagious disease of that kind it is almost impossible to get legislation from the various States which shall be uniform and in such shape that the disease can be stamped out in

each State independently; and on that account it was taken up by the National Government, and the result has been that pleuro-pneumonia is almost completely eradicated from the herds of this country. In my judgment there is less now than practically at any time in modern times. It is a disease that is nearly gone. Now in the last few years we have had an increasing knowledge of tuberculosis among cattle and especially among dairy herds. Down in the East, in New York and in Massachusetts, the States have spent a large amount of money in attempting to stamp the disease out. They have succeeded to some extent, but not completely. In this State we are just beginning to face it. It is a condition that has existed a long time. It is undoubtedly increasing, and it is a serious menace to public health, through the consumption of milk from tuberculous cows. There is less danger in the consumption of meat from a tuberculous animal, although there is some. The cooking of meat, as it is practiced in this country generally, is sufficient to remove almost all danger; but in milk, which is consumed in its natural state, the milk of a tuberculous animal is a very fruitful cause of consumption in the human family. The experience of the States in the last few years, that have taken active measures, has not been entirely a satisfactory one. In the first place, the different State officials made different regulations, and the States provided different means of stamping out the disease. It seems to me, therefore, that it would be well within the purview of the Bureau of Animal Industry to make the matter national and thus undertake to eradicate the disease, as it did the pleuro-pneumonia.

Q. (By Senator KYLE.) What was the pleuro-pneumonia law?—A. That authorized the condemning and killing of animals that the inspectors found to be affected with the disease.

Q. Those in transit from one State to another?—A. As well as those in the various States.

Q. (By Mr. CONGER.) Wherever found?—A. Wherever found. Chicago was probably a worse center than any other, and there were large numbers of animals that were condemned and slaughtered. I do not recall just what the provision was for payment for those animals, or whether there was any. The scientific knowledge of the disease of tuberculosis is not entirely complete at the present time. There is some difference of opinion among scientists as to the exact stage which the disease must have reached before it becomes a menace to those using the products; and in drafting a law of that kind, providing for that extermination, it seems to me that there should be some provision for a graduated payment for the value of cattle that are condemned for the benefit or conservation of the public health. If an animal is thoroughly diseased, and the disease exists in the udder or in the milk veins, so thoroughly diseased that its recovery is absolutely out of the question, it is dangerous to use the products. Then there is no reason why that animal should be paid for, and it should be condemned on grounds of public policy; no more reason than there would be in paying for hogs lost from hog cholera. The disease has reached such a stage that he has no property right in the maintaining of an animal of that kind. The tests for tuberculosis, however, will reach where the disease has made but small progress, and where the animal itself might be useful for a number of years yet. In that case, it seems to me, there should be a graded payment for animals of that kind condemned and slaughtered. The disease can make considerable progress, according to the best expert opinion now, before it affects the healthfulness of the products from that animal. For instance, in the case of a dairy cow, unless the tuberculosis existed in the udder and in the milk glands, the milk may not be affected. Of course the disease will in the course of time progress to a point where it is affected; yet in the earlier stages the disease is contagious and the animal should be slaughtered.

Q. Is it not transmitted from one generation to another, the same as in the human family?—A. That is not settled. It is claimed by good authority that a cow may be diseased and yet raise healthy offspring; but they should not nurse; it will be transmitted to the offspring through the udder rather than by birth. Animals might be diseased to some extent and still be valuable for breeding purposes. That, I say, is the best opinion. I believe there is some doubt on that score, but that is the best opinion among veterinarians now. It would be just, if animals are to be condemned which still have a breeding value, that provision should be made for some payment to their owners.

Q. Do you know if such provision exists in any of the State laws now in force?—A. It exists, I think, in Massachusetts and in New York, but just what the provision for payment is there I am not familiar.

Q. Has Illinois such a law?—A. Illinois has a board of live-stock commissioners who have just begun to move in this matter. Governor Tanner became very much interested a short time ago in the matter, because it was discovered that

the herd of cattle that were furnishing milk for the executive mansion were infected with tuberculosis, and he was present when the animals were slaughtered; and it was shown it did exist very badly in that herd, and since that time the board has taken up and is pushing the question.

Q. (By Senator KYLE.) What breed of cows are most liable to be affected?—A. I should say that the most highly organized dairy cows; but it is not exclusively in the dairy cows; it affects all classes of cattle.

Q. How could the disease go on for a length of time without being noticed?—A. It is one of those things that existed but was unknown until brought out by scientific research.

Q. How is it noticed? In the appearance of the cows?—A. No doubt it is in its last stages; but it is very difficult to get it from any outside indication. Of course, when the animal is finally ready to die, the general physical effect is apparent; but in its incipient stages it is not apparent, and it can only be located by the test called the tuberculin test. It is an injection of virus and then watching and taking the temperature; where there is what they call a reaction of as much as 2° the disease exists in a dangerous form.

Q. (By Mr. CONGER.) Your idea is that a Federal law would be much more effective in its operation than the State laws?—A. Than the State laws, from the fact that it would be uniform. The Bureau of Animal Industry, having done such splendid work in the eradication of pleuro-pneumonia, could do equally good work in the stamping out of this disease.

Q. Referring again to the effort of Secretary Wilson to promote the selling of dairy products abroad, is it or not a fact that there is considerable reluctance on the part of those people to consume American products or American food products?—A. There is in a number of countries of Europe a prejudice against American food products, and I believe that this prejudice has grown out of the fact that our people have not been careful to export the best goods. Our export trade has been largely considered as a means of working off that surplus which was not desired at home, with the result of building up a bad reputation for goods. Exactly the opposite course has been followed by some of the other exporting countries, Denmark, for instance, and even Australia and New Zealand, and their shipments are of the very best grades of their dairy products.

Q. Have you an idea that the Government could aid in the introduction of the American products abroad in the way of an export commission or anything of that sort?—A. I believe that that could be done, and I think it is a matter that would be of very much value to the agricultural industry. A little along that line was done when Secretary Rusk was Secretary of Agriculture. He secured an appropriation, I believe, amounting to about \$10,000 a year, to be expended in introducing American products abroad. It was an effort that was especially made with Indian corn and its products. Some results have followed that work, but the work was stopped within 2 years after its institution. So we never had a fair opportunity to judge what might have resulted. To illustrate what the little that was done accomplished, when Mr. Murphy, who was the agent Mr. Rusk selected, went to Denmark in 1890 or 1891—I have forgotten the date—Denmark did not import a pound of American corn products in the shape of meal or flour or the various food products. Mr. Murphy was there a short time, and practically all that he did was to personally solicit grocers to handle some of these products, told them where they could get them, and gave, in connection with Clark E. Carr, who was United States minister to Copenhagen at that time, a dinner of distinctively corn products. This was practically all that was done in Denmark, and yet from that time forward there has been an increasing trade in corn products with Denmark until it now amounts to 20,000 or 25,000 barrels of corn meal a year, and it is doubling up very rapidly. I believe an intelligent and concerted effort along commercial lines through a commission of that kind might result in opening a market for a number of our American farm products.

Q. (By Senator KYLE.) Isn't that a better field for operation along that line than the case of many other products? Europe does not, as I understand, come in competition with us in that line.—A. I think corn is especially favorable for an effort of that kind, but a similar effort might build up the trade in our dairy products—a continued effort along the lines that Secretary Wilson had undertaken; and that, with the developments that are coming along in the East, in China and the Orient generally, there should be opportunities there for their development. It seems to me that the Government might well afford to have a commission for several years endeavoring, in the various markets of the world, to open a market for American products. Of course, the objection is raised at once on the part of some that the individual manufacturers or the individual producers should look out for themselves in finding a market; but among the agriculturists the

individual interest is very small, and the impossibility of uniting them in a comprehensive private movement makes it sure that the trade will develop by individual initiative very slowly.

Q. (By Mr. A. L. HARRIS.) To what extent could our consular service be of assistance in enlarging the demand for American farm products?—A. It could do the work completely if the service was organized so that the consular officers were absolutely in touch with the interests that they should represent; in other words, if the consular service were brought down to a commercial basis, instead of appointing men for political preferment, substitute the latter with men who are familiar with trade in products that might be demanded in the localities to which they are sent. We have a number and have had a number of very valuable consular agents who have done great work in exploiting American products abroad, but the service as a whole has not been as successful as it would be under other conditions.

Q. Do you think in some instances the consuls have not fully appreciated the importance?—A. I do not think there has been an intentional overlooking of anything, but the mere fact that a man is not in close touch with the trade which he is supposed to represent would weaken his usefulness.

Q. (By Senator KYLE.) What do you note as to the drift of the consular reports to the State Department?—A. I should say that the drift, decidedly, is toward a belief that there is an opportunity for a large increase in American exports.

Q. Are they reporting chiefly upon the economic and political conditions of foreign countries?—A. In a considerable measure, yes; and yet there are a number of them who make very valuable trade reports. A man goes abroad as a consul, perhaps into some district where we might work up a trade in cotton goods. He never has seen a cotton mill in his life, and knows absolutely nothing about the cotton trade. He is not in a position to make as intelligent and helpful reports for the cotton trade as a man who is familiar with it—in other words, as a commercial agent.

Q. (By Mr. A. L. HARRIS.) Isn't the consular service at the present time showing more interest in introducing agricultural products for trade than heretofore?—A. I think so, decidedly. I think the service is improving and that there is an improvement in the personnel of the service.

Q. And there is room for it?—A. Oh, there is room for further improvement along the lines I have indicated—in the line of selection for special fitness.

Q. (By Senator KYLE.) The fact that men have to pass a rigid examination before being sent over is a good thing?—A. Undoubtedly that has been instrumental in bringing about the betterment of the service.

Q. (By Mr. A. L. HARRIS.) Is it not a fact that a few years ago, even if American products were introduced, or rather an effort made to find a foreign market for American products, it was chiefly for manufactured products rather than the products of the soil?—A. Yes, I think that is true; and I think that is largely true at the present time.

Q. You think that agricultural products are now receiving more attention than they did formerly?—A. There is one fact that must not be lost sight of, and that is that within the last few years our enormous increase in manufacturing ability has made it necessary that we look more and more to a foreign market for our manufactured as well as our agricultural products; and on that account the consular service must continue to improve, in order that we may get the full benefit from it under these changed conditions. When we had very little or nothing to export, then it made very little difference what kind of a consular service we had; but now that you have reached a stage where the markets of the world are being sought, the consular service should be made up of men who are really what they profess to be, commercial agents. They should be commercial travelers for the United States.

Q. (By Mr. CONGER.) Have you any further suggestions to offer that would benefit the farmers?—A. I am inclined to think that the suggestions I have offered now cover the more important things that can be done for the present benefit of agriculture—that is, in the way of action.

There are questions growing out of the settlement of the problems forced upon us by the result of the war with Spain, in the correct settlement of which the agricultural interests of the country are vitally interested. For the last 25 years the owners of farm lands through the older settled communities have been brought into competition with the homesteads given away by the Government, practically given away. That land now is generally all taken up; that competition is over. The result is that we are now beginning to see a rise in value of farm lands and a corresponding improvement in the position of the American farmer. There has been a good deal of opposition at one time and another during all these years of depression, on the part of the farmers of the older sections, to the Government

distribution of lands to homesteaders or citizens generally. Now, if, as a result of the war, Porto Rico and the Philippines, and possibly Cuba, eventually are to become integral parts of the country, it follows that a new competition with American farmers will arise, as those countries or colonies produce to some extent products which we grow at home, and which up to the present time paid the tariff duties charged against them. If these possessions are going to come in as Territories, and eventually as States, no duties can be maintained against them. This would mean a meeting in unequal contest in two lines of production, tobacco and sugar. At the present time we are developing very rapidly the beet-sugar industry. The beet-sugar territory largely lies west of New York, almost in a direct line; and in the Central West we are developing a very large industry in the manufacture of beet sugar. The Philippine Islands at the present time, under the most shiftless methods of agriculture, produce something like 600,000,000 pounds a year of raw sugar. That, if admitted duty free to the greatest sugar market in the world—and this is the greatest sugar market—will be sufficient sugar, grown under the present shiftless method, to supply all the sugar needed for consumption by the people living west of the Missouri River.

Q. (By Senator KYLE.) Have you the accurate figures?—A. Yes; that allows for home consumption. The export trade has reached almost 600,000,000 pounds in some years.

Q. And to what countries?—A. United Kingdom, China, United States, and Spain, with small amounts to other Continental countries. The United States has never taken a very large share. Now, if the duty was suddenly stricken off and that sugar could come here free, as Hawaiian sugar does, it is reasonable to suppose that practically all the sugar grown in the islands would come here, and it would suddenly stimulate sugar production there. The same result followed in the Hawaiian Islands under the reciprocity treaty of 1876. Up to that time Hawaii produced annually something like from 20,000,000 to 30,000,000 pounds of sugar a year, and it was insisted and promised very positively that she had reached the limit of her production. From that time on the sugar production of Hawaii increased by leaps and bounds, and last year the United States alone imported 500,000,000 pounds—practically all they grow. That is nearly 24-fold what they claimed as their productive power.

Q. Has this been a detriment to the sugar industry in the United States?—A. It undoubtedly has.

Q. What is the annual consumption of sugar in the United States?—A. Something around 4,000,000,000 pounds, I think—2,000,000 tons a year.

Q. That is about the correct figure?—A. Yes.

Q. How much of that do we import?—A. About 1,700,000 tons.

Q. We imported between 1,600,000 and 1,700,000 tons?—A. Yes.

Q. We are compelled to import it because of our inability to produce about three-fourths?—A. A little more.

Q. That being the case, there is plenty of market, is there not, for American sugar right at home?—A. Under present tariff conditions, yes.

Q. There has been a good demand for beet and cane sugar—the sugar we can raise right here in America—and will be for some years to come?—A. Necessarily must be, because this is the largest consuming country in the world.

Q. And we are obliged to import three parts of our sugar in order to supply the demand of our own people; so that the sugar growers have not been crippled in any degree by the importation of sugar from foreign countries?—A. It is hardly fair to say they have not been crippled. I would rather put it that, if they had been given the full advantage of tariff discrimination, they would have rapidly grown to a point where they would furnish a much larger proportion of the sugar. Within the last 2 years there has been a constant and enormous increase in the production of beet sugar.

Q. We produced nearly 40,000 to 50,000 tons in the United States?—A. Something like that.

Q. How many years, in your judgment, will it be before we arrive at a point where we will be injured to any great extent by the importation of sugar from foreign countries—that is, will have to seek an export market?—A. In other words, your question is, How soon will we displace entirely foreign sugar?

Q. Yes.—A. That will depend entirely on how much the industry is favored in its beginning, because the beet-sugar industry is in its beginning now.

Q. (By Mr. CONGER.) Your idea is that if it is not favored it will not develop?—A. No; my idea is that if it is not favored its development will be very slow; whereas if it is properly favored it will grow very much more rapidly.

Q. (By Senator KYLE.) Your idea is that by shutting out foreign sugars by a duty you can raise the price of beet sugar at home?—A. What I am objecting to is the admission free of duty of foreign sugar. Let the matter stand in statu quo.

Q. So long as we are compelled to import three parts of our sugar, and the American people are eating the sugar, I want you to figure out exactly how a good stiff duty of 2 cents a pound, or whatever you put on, is going to benefit the American people?—A. In the same way that the establishment of any large industry in the country is a benefit to the whole country. Now, I might say, we have every facility for sugar production in this country. For the last 100 years they have been making beet sugar abroad. It is only within the last 2 years that we have been making it to any extent. In other words, the industry is just beginning here. Now, with the same facilities for the manufacture of iron goods, the raw material and everything in equal profusion at least with every other country, we have been 200 years in building up an iron industry such as we have now, where we are at the head of the world. With anything anywhere near equal in the way of fostering care, we should be able to build up our sugar industry in a much shorter time. No matter what the legislation is, eventually we are going to make our own sugar; there is no question about that in my mind; it is bound to come. But my belief is the sooner it comes about the better it is for all concerned, and that by the fostering care of the Government it may be brought about much sooner.

Q. (By Mr. CONGER.) Do you think any fostering care of the Government is needed greater than the tariff that is now collected?—A. I do not. I believe that if the matter remains in the present status the sugar industry is on a basis where it will develop rapidly.

Q. Your idea is that if the present tariff is held up the sugar industry is bound to develop very large proportions in the very near future?—A. In the very near future.

Q. And that if the Philippine Islands and the other sugar-producing countries are annexed and the duty removed— A. [Interrupting.] That an avalanche of free sugar will set us back in our development. If the Philippines show the expansion capacity that Hawaii has; if their production increase only 10 times where Hawaii increased 25 times, after saying they had reached their limit, then the Philippines could send us sugar enough to supply our whole demand.

Q. Is it or not a fact that it is possible to produce cane sugar in Cuba or the Philippines so cheaply that beet sugar could not be produced in the United States at a profit, if there were no tariff?—A. In my judgment, in the end beet sugar will more than hold its own against cane sugar, under any conditions, but that it will be a matter of very slow growth and slow development. It must be built up slowly.

Q. (By Senator KYLE.) Have not the beet-sugar growers generally shown remarkable ability to take care of themselves and compete with the world?—A. They have in European countries, where the industry was built up almost entirely by the fostering care of the Government. They have reached a point where cane sugar is simply excluded. The beet sugar has crowded cane sugar out entirely.

The question with me was whether or not it was not wise to call attention to the fact that in framing a government for those colonies it should be so done as to leave them, so far as their import trade with us is concerned, on practically the same basis as now. There is considerable feeling in some classes in the country that the prosecution of a war in the Philippines is largely for the benefit of organizations of capital, in order to allow them to exploit the islands later. However unjust that feeling is, it exists to some extent. But if it became apparent, in framing a government for those islands, that the interests of the American agriculturists were to be taken care of, it would remove, in my judgment, nearly all of the opposition that seems to be growing up among the farmers of the country to the policy of expansion.

Q. (By Mr. CONGER.) Is it not a fact that quite a large portion of the revenues of the Government are derived from the duties on sugar?—A. Yes, a very considerable portion.

Q. Isn't it quite probable that the needs of the Government are likely to be such in the future that it will be impossible to take that off, and it must be kept on in order to pay the expenses?—A. That would seem reasonable, but the duties were remitted in the case of the Hawaiian product at a time when revenue was needed more than or equally as much as it is now.

Q. (By Senator KYLE.) How much had they been receiving from the Hawaiian Islands?—A. Up to that time, only something like 30,000,000 pounds.

Q. I mean revenue.—A. It could not have been very much at the time the reciprocity treaty was enacted, in 1876.

Q. What have you to say of the fear on the part of the agriculturist? Is there any ground whatever for a statement or a feeling that the war was originated or is being carried on by certain lines of capitalists, with a subsequent view of

exploiting the islands?—A. I believe myself that it is absolutely untrue. There is a point here that may be important. It must also be borne in mind that all of the country involved in this dispute lies in tropical regions, and that it is already thickly populated. This country does not need lands upon which to colonize its surplus population, and if it did, it is the history of the Anglo-Saxon race that it does not successfully populate tropical lands. It follows, therefore, that these new acquisitions will not be exploited by immigration of our own people, and that their agricultural capabilities will be exploited by capital which, by direction of special intelligence, will bring the labor of the orient into competition with labor at home. This is on the assumption that they are going to become States. It is this belief that is crystallizing a sentiment against expansion throughout the agricultural districts of the West.

CHICAGO, ILL., August 11, 1899.

TESTIMONY OF MR. OLIVER WILSON,

Farmer, Magnolia, Ill.

At a meeting of the subcommission on agriculture in Chicago, Ill., at 2.40 p. m., August 11, 1899, Mr. A. L. Harris, presiding, Mr. Oliver Wilson, of Magnolia, Ill., having first duly affirmed, testified as follows concerning agricultural conditions, the topical plan of inquiry on agriculture being followed:

Q. (By Mr. A. L. HARRIS.) You may state your name, residence, and occupation?—A. Oliver Wilson, Magnolia, Ill.; occupation, farmer.

Q. Please state what official positions you hold in connection with any farmers' organization?—A. I am master of the State Grange of Illinois, and director of the State Farmers' Institute for the Fourteenth Congressional district.

Q. How long have you been master of the State Grange?—A. Six years in December.

Q. To what extent have you traveled over the State visiting subordinate granges?—A. I have been over the greater part of it, especially the northern and central sections: over all of it, probably.

Q. You are conversant with the condition of the agricultural industry?—A. Somewhat, yes; more especially in the northern and central sections of the State.

Q. Please state what, in your opinion, has been the increase or decrease in the number employed in agricultural labor, in the last, say, 20 years?—I mean the wage-workers, not including in that the small farmer who does his own work?—A. I think there is very little difference. As far as I know there is just about the same number employed. Most localities differ; some have become more densely populated and others again have not as many in population as they had about 20 years ago. I think they would average about the same.

Q. Has the condition of the hired laborer improved in the last 20 years, socially and intellectually, or otherwise?—A. I do not know that it has particularly. There has been a different class to deal with. Very largely the hired help of the farms now are of foreign birth. Twenty years ago we had a great many of our native-born citizens.

Q. What has become of your native-born citizens?—A. Largely gone into the towns.

Q. For what purpose?—A. For all purposes.

Q. (By Senator KYLE.) Why?—A. That is a pretty big question. I suppose it was because they thought there was more money in other business than there was in farming.

Q. (By Mr. A. L. HARRIS.) Was it the money question alone or was it social?—A. Not altogether. Financial and social conditions were considered better in the cities.

Q. (By Senator KYLE.) Is there a disposition among the young men to feel that other vocations are looked upon as more respectable and offer a chance to climb the ladder, and that the ladder reaches up from the farm?—A. There is not as much feeling in that line as there was 20 years ago. The young farmer to-day believes he is as good as any other man. He possibly thinks perhaps that other vocations offer a little better chance to, as you say, climb a little higher.

Q. Sometimes feels that he does the drudge work for humanity on the farm?—A. Sometimes; but that is largely done away with by improved machinery. There is no drudge work on the farm any more. There is hard work, but not drudge work.

Q. (By Mr. A. L. HARRIS.) Has improved machinery increased the amount of labor that the employee is able to do?—A. Certainly.

Q. Is there any irregularity of employment among the farm laborers in your part of the State?—A. Now, I don't quite understand that question. What do you mean by that—irregularity of chance for employment?

Q. No. Of course it is affected by the seasons to some extent. It is not like the manufacturer who works all the year round. In former years the hand would be hired in the summer and probably until the fall, and in the winter season he would not have employment. Is there any change in that?—A. Very little; a little bit. There are more hands employed by the year than there were 20 years ago; but then it is very largely hired for 9 and 10 months.

Q. What becomes of the hired men the other 2 or 3 months?—A. Many of them stay throughout the country working, some by the day, or looking after feeding of the stock, or something of that kind, for their board.

Q. They do not spend then in the winter what they make in the summer, in the way of paying board, if they are inclined to work?—A. No; not generally; the average of them do not pay board in the winter time; they manage to make their board in the winter.

Q. (By Senator KYLE.) Are they professional agriculturists? Do they look forward to the time when they can rent a farm of their own and begin operations?—A. Part of them; I could not tell what per cent, but I suppose 50 per cent of them do, possibly. I do not know what per cent do get them.

Q. Do many hoboos, so called, go into the country and remain a little while and go around through the country?—A. Very few in northern Illinois; more in southern; a great many more.

Q. (By Mr. A. L. HARRIS.) Have you any demand for transient labor in busy seasons?—A. Yes.

Q. What are your opportunities for getting it at the present time?—A. Poor.

Q. Why?—A. It is not to be had; they will not work.

Q. How are you able to supply that deficiency now?—A. By getting what men we can out of the towns and villages who do not work on the farm regularly but go out for extra occasions and extra pay.

Q. What is the usual number of hours upon the farm at the present time?—A. Do you mean in the field?

Q. Yes.—A. About 9 hours.

Q. (By Senator KYLE.) Changed somewhat from former years?—A. Yes; when I was a boy. From about 7 o'clock to half past 11 and from about 1 o'clock to half past 6 is the prevailing custom in central Illinois.

Q. That is amongst farmers who do their own work as well?—A. Yes.

Q. (By Mr. A. L. HARRIS.) The hours, then, have become shortened?—A. Shortened.

Q. Is that the effect of any organization among the agricultural laborers themselves?—A. It is more the effect of organization among the farmers themselves.

Q. They have been willing to concede shorter hours?—A. They did it for their own benefit. They want a little time for something else, and with improved machinery it is not necessary. It is long enough for a man and a team both.

Q. What is the average number of days of employment in a year of the average farm laborer?—A. I suppose from 250 to 300 days.

Q. How is the hired labor paid?—A. Hired by the month almost altogether.

Q. (By Senator KYLE.) Or by the year sometimes?—A. Some few by the year, yes; but they are generally hired for a year at so much a month; that is the rule; of course some are hired for the year.

Q. (By Mr. A. L. HARRIS.) What are the maximum wages?—A. In central Illinois the maximum would be this year \$21 or \$22 and board.

Q. (By Senator KYLE.) For how many months?—A. Nine or ten.

Q. (By Mr. CONGER.) How does that compare with a year ago, and with other recent years?—A. Very little difference; no difference that I know of in recent years; higher than it was 20 years ago.

Q. (By Senator KYLE.) When you hire a man by the year, how much do you have to pay, as a rule?—A. You mean a man that boards in the family?

Q. Yes.—A. Probably \$18. Some heavy cattle feeders will pay \$20 by the year.

Q. That is, with the present price of agricultural products. You say that is better than it was 20 years ago. How about the relative price of the farmers' commodities?—A. Not so good. I want you to understand I am not comparing this year with absolutely 20 years ago.

Q. Just about the time now, and about that time. So that the agricultural laborer has nothing to complain of as compared with those times?—A. I can not see that he has.

- Q. (By Mr. A. L. HARRIS.) Does he complain?—A. No; I don't think so.
- Q. How do you pay?—A. Cash payments almost altogether.
- Q. (By Senator KYLE.) You would not attempt to bull the market on the part of these laboring men?—A. No.
- Q. As it is in the federation fields in cities?—A. No.
- Q. Here are large bodies of these men working in the cities, and members of the federations, keeping up the price. Why don't they seek the fields and farms, where there is a good living to a good man?—A. They are, a little bit; the tide is turning from the city to the country. A laborer of this city is coming right into our neighborhood now, moving his goods right there, to go to work by the day or month. He has lived here for 20 years and been fairly successful, so far as I know; that is, fairly so for a laborer. He is the second one that has come in there this spring.
- Q. (By Mr. A. L. HARRIS.) If your hired man is married, do you furnish him a house?—A. Generally.
- Q. On what terms?—A. Married men, as a rule, get about \$25 a month, house, patch of ground varying from a quarter to half an acre, either cow furnished or pasture for his own, and team free of charge to do what hauling he may need, such as his fuel.
- Q. Who boards him?—A. He boards himself. That would be by the year. Only a few married men will hire for 8 or 9 months; they want place all the year round.
- Q. (By Senator KYLE.) These are dairymen or stockmen, as a rule?—A. No; they are farmers and general feeders. I am not in the dairy region myself. I am speaking more for that section.
- Q. (By Mr. A. L. HARRIS.) Have you any crop sharing or renters?—A. A great deal of it.
- Q. On what terms, as a rule, do you rent to the crop sharer?—A. The landlord receives from one-third to one-half. Probably the average would be two-fifths.
- Q. What does the landlord furnish?—A. Nothing but the land and the buildings. He gets two-fifths for the land, and receives, as a rule, cash for all grass lands.
- Q. That is on crop sharing?—A. Crop sharing for the grain. It is pretty hard work to share on pasture unless they are in partnership in the stock.
- Q. Do you have anything in the shape of partnerships?—A. Yes; some; not a great deal.
- Q. Where you have that will you please inform us what the landlord furnishes and what the tenant furnishes, and the terms of division?—A. There is very little of it done, unless they go into partnership with stock, and that varies generally. The landlord will furnish the land, and where they go in equal partnership on the stock—that is, in owning it—the man puts his labor against the land, and receives half the proceeds.
- Q. That system prevails pretty much in the State, so far as you know?—A. So far as I know, or nearly so. Of course, there are some minor conditions; as a rule the landlord pays the taxes on the real estate; sometimes the tenant has to pay a part of them.
- Q. Which of the two plans is the most advisable in your estimation—crop sharing or partnership?—A. It would depend altogether on circumstances. One might be better than the other. It just depends on the man and the locality. There are a great many tenants in this State that could not rent a farm, or could not furnish half the stock; they have not the capital.
- Q. (By Senator KYLE.) What do you know of a plan which is in operation in the West, by which the owner of the land will furnish a farm and a certain amount of stock—horses and cattle—and divide the proceeds equally; the farmer furnishing the labor, the owner furnishing the seed for the farm and the original stock for the stocking of the farm, and getting half the increase of the cattle, hogs, and horses, and letting the renter make the original stock good at the time of the severing of the contract?—A. I have known of that, but it is not general. There is another system that is coming in just a little, on corn; I don't know that I have noticed it on small grain: A man pays so much a bushel for the raising of the corn. That is the way he pays his help, instead of by the month; but it is not general.
- Q. (By Mr. A. L. HARRIS.) You spoke a moment ago about your help not being native; do you mean they are foreign immigrants?—A. Largely so; yes.
- Q. Are they an intelligent and prosperous class of farm laborers?—A. It depends on just what section you go into; in many sections they are.
- Q. What nativity usually?—A. Through central Illinois they are usually German, Danish, and Swedish.

Q. Are they an intelligent class of people?—A. Seem to be.

Q. Is there any tendency, where they have an opportunity, of colonizing or getting by themselves to preserve their customs and language?—A. Considerably so.

Q. Where they are able to maintain farms of their own, are they inclined to congregate into communities?—A. Nearly altogether.

Q. Do they become American citizens as quickly as where they are distributed?—A. Not as quickly.

Q. It is more advisable for them to distribute themselves among the natives?—A. If it was left with me, I would have them distributed. I wish it had been so for the last 75 years.

Q. What is the effect of such immigration upon the agricultural industry?—A. If there had been no immigration here agriculture would have been very primitive in this country.

Q. If there is a large amount of immigration, is the tendency to increase the supply beyond the demand? Is there any part of Illinois, to your knowledge, where there has been a surplus of labor of that kind?—A. I have never known yet the time but what a good hand could find work on the farm.

Q. Then the immigrants have not affected agricultural labor to its detriment?—A. It has. I suppose if there had not been so many immigrants more of our own boys would have stayed at home on the farm.

Q. Do you think the immigrants have driven the boys from the farm, or have they gone of their own volition?—A. Of their own volition; but then probably that was one of the causes.

Q. (By Senator KYLE.) Was that the cause in New England?—A. The cause in New England was that they had no farms to stay on; as far as I know. I don't know of anybody leaving the New England farms.

Q. Does the method of farming and living of the German farmers in this country have a tendency to depress the prices of agricultural products?—A. I don't think their manner of farming does. They follow out the usual manner of farming. The Germans with us are good farmers. Their manner of living may depress local markets some.

Q. What do you think of the statement that in some portions of the United States they can do without the ordinary luxuries that the American farmer thinks he must have, and can raise a crop of wheat for about one-half what the American farmer can?—A. I don't understand that they can raise it any cheaper, and there is a great part of them whom it will cost just as much to live; there are classes that live plainer, use coarser food, and don't care for a variety.

Q. I mean money outlay in the raising of crops?—A. They probably will not lay out as much money, for the simple reason that many of them get more help out of the women and children than the Americans, and in that way they will not spend as much.

Q. (By Mr. A. L. HARRIS.) Have you any colored labor in your section of the State?—A. Not in our section; there is very little colored farm labor in northern and central Illinois; a great deal in southern Illinois.

Q. Have you had an opportunity of observing the character of that labor where it exists?—A. Somewhat.

Q. Is it efficient?—A. As a class, not as efficient as white labor; that is, in the aggregate. I have known just as good men that are isolated, just as good hands. But take it where they depend on colored labor very largely, it is not nearly as efficient as white labor.

Q. What is the school age of children in this State?—A. Six to 21.

Q. Are your school facilities good?—A. Compared with other States, yes; compared with what they ought to be, no.

Q. (By Senator KYLE.) Have you compulsory education here?—A. Yes.

Q. (By Mr. A. L. HARRIS.) Have you any means of knowing the per cent enrolled?—A. I have not, outside of my own county, and of course that does not give it all. We have about 80 per cent enrolled in our county, of school age.

Q. Your county an average, is it?—A. Well, I presume it is above the average, because we have no cities in our county; strictly rural.

Q. Are the public school facilities sufficient in your county, and so far as you know, in your State, considering the schoolhouses, distances, size of the districts, and all that would go to make the common school system?—A. We probably have about enough schoolhouses.

Q. What is the character of your houses?—A. Better than they were 10 years ago, a good deal. A great many of them are not what they should be.

Q. What is the character of the teachers, as to ability to teach and efficiency?—A. They claim they pass a sufficient examination, but it is not up to where I think it should be in three-quarters of the schools, probably.

Q. Do you look upon your common school curriculum as being sufficient for the needs of the agricultural people?—A. I do not.

Q. Is there a tendency to improve?—A. Yes.

Q. (By Senator KYLE.) You refer to the ordinary country school?—A. Yes.

Q. You do not have what is called township schools?—A. It is not general; there are a few in the State, working very satisfactorily, I understand, but I don't know personally anything about it.

Q. Do many of the young people go off to the high schools in the villages after they complete the country schools?—A. A great many go to the State institutions more largely.

Q. But a great many, the majority, can not go to the State institutions?—A. A great majority of the school children stop with a common country school education; taking the agricultural districts, I suppose, probably 80 or 90 per cent.

Q. (By Mr. A. L. HARRIS.) What advantage, if any, to an agriculturist, would a technical education be?—A. The same as to anyone else, I suppose.

Q. Should it be encouraged, in your opinion?—A. I think so.

Q. Is it in your State?—A. Very little.

Q. What, in your opinion, is the earning of capital employed in agricultural pursuits, compared with former years, say 30 or 40 years ago?—A. I don't think the earning is as great, because there is so much more capital invested in the same area. I do not think the earning is as great, because rents are very little higher and land has doubled in value over a great part of this State in the last 20 or 25 years.

Q. What, in your opinion, are the earnings of such capital as compared with other lines of business?—A. My opinion would be that it is not so much, from observation.

Q. (By Senator KYLE.) That is, in your section of the country?—A. In my section of the country, land running from here to 25 and 40 miles south of Bloomington runs from \$75 to \$125 an acre.

Q. You don't raise more corn, and you could buy that land years ago for \$30?—A. Then we had slews of it; but now the country is filled up. To my earliest recollection, a man gave a third for rent. Now the most of them don't give more than two-fifths. Land then was worth from \$15 to \$25 through central Illinois. Now it is worth from \$75 to \$125.

Q. They bought land from \$5 to \$20 per acre and at the same time raised wheat for 60 cents, so that they got \$12 or \$15 worth of crop out of the land that they paid \$5 for?—A. Yes. I have known right in my own section where I crop of small grain was worth more than the acre of land it was raised on, but you can not get it here now. I am speaking of northern and central Illinois, and I believe that is correct.

Q. What do you think about the present system of taxation, whether it is just or unjust, and what are the remedies you would suggest?—A. The farmers of this State are not satisfied with the system of taxation.

Q. (By Mr. A. L. HARRIS.) I wish you would, in the first place, state your system as nearly as you can, and then state the reason why it is not satisfactory.—A. I do not know whether the system varies much from other States or not. The system is supposed to tax all property at its cash value; that is the supposition.

Q. (By Senator KYLE.) Personal and real?—A. Personal and real. They have per cents. I am not able to give now just the different per cents—certain per cent for State, county, township, and district taxes. There seems to be a growing desire that there should be some system whereby all property shall bear an equal share of taxation. The claim is—and I guess but few dispute it—that the farmers of the country are paying the big share of the taxes, probably 78 or 79 per cent.

Q. Why is that?—A. I only know two reasons. One is the system, and the other is that the farmer can not cover up any property, even if he is so inclined. His property is all out under the assessor's eye. Of course, real estate is the same everywhere, but personal property is not; it is impossible for the farmer to cover up anything he has. The farmers are not, as a rule, great money lenders, so of course their surplus is generally invested in real estate or improvement of stock or something of that kind; so they keep it all out, open before the world. The farmer gives an itemized account of all his property, and I believe he is about the only man in the country that does. When the assessor comes around, he goes out on my farm and says, How many horses have you 4 years old, and how many cattle, and how many hogs, and how many chickens? I believe they say there is a license on dogs; but then they take them all the same. They go into any little village and little city, and they take it all in one question. They ask the merchant, what is the amount of your merchandise; and some merchants are honest and probably give it.

Q. He does not say how much calico, etc., but how much merchandise?—A. That is on the listing sheets; that is the way it has been from time immemorial—the

only ones I ever saw. There should be some way to make them all alike. If one man itemizes his property, every other man should do it. Why this discrepancy is, I don't know. I don't know whether all the States are the same. I think our merchants are just as honest as the farmers, but I notice when the assessor comes in they will say, "Let me see, what was I listed at last year? My stock of goods was never quite as low the 1st day of May as it is the 1st day of May this year."

Q. How about the banks?—A. They manage to get out of paying any personal taxes, pretty nearly. I am not a banker; I don't know just how they do it.

Q. (By Mr. CONGER.) Under the custom in this State of taxing banks, do they escape?—A. They don't escape entirely; they are assessed.

Q. Are they not assessed on the cash value of their capital stock?—A. I never knew it to be done.

Q. Do not the farmers make complaints in Michigan about taxation?—A. I don't think the farmer complains about a just system. He likes to pay his tax, but he likes everybody else to pay his also.

Q. You believe he complains because he thinks someone is paying less than his fair share?—A. He knows it. It is just like your governor came out 2 years ago and said the railroads were paying one-eleventh of their taxation. I think you will remember that statement of the governor to the legislature. I suppose what is true in Michigan is true in Illinois.

Q. (By Senator KYLE.) That is, he thinks they should pay taxes upon watered stock as well as the money actually invested?—A. Certainly should.

Q. Make the roads earn interest on that amount?—A. I have paid mileage on watered stock coming up here to-day all right.

Q. (By Mr. CONGER.) The railroads of Michigan, however, are paying \$1,000,000 a year, and if that is only one-eleventh of what they should pay, would that statement mean that they should pay \$11,000,000?—A. I suppose so.

Q. Their total earnings are only about \$30,000,000 inside of the State, which would mean a tax of 33½ per cent of their gross receipts. If the farmer had to pay that, would he not think he was pretty heavily taxed?—A. Well, you may look it up and see if I am quoting him correctly. You have no right to question your governor.

Q. (By Mr. A. L. HARRIS.) You have stated the shortcomings of your system. What suggestions have you to make in regard to amendments to your system that would remedy the evils complained of?—A. Any just system would suit me.

Q. Have you ever thought out any improvement over the present system?—A. Yes, I have thought of them, but I do not know that I have a system that I would care to give out here. All our organization asks is a just and equitable system of taxation; it does not outline any.

Q. Is not the trouble to get at some system unless someone makes a start?—A. Certainly; and we suppose that you fellows are to make the start. We tell you what we want, and you figure it out.

Q. (By Senator KYLE.) Legislatures will never figure those things out unless some person takes the initiative. If the farmers of Illinois or the State Grange would figure out something and place it before the legislature, are not the chances that they would get an improvement?—A. We are working on it, but there is nothing definite yet which we can give out as to new systems. We want every man to pay according to what he is worth, no matter whether he is a miner, a farmer, a merchant, or a lawyer.

Q. (By Mr. CONGER.) Isn't there a new system of assessing personal property now being put into operation in Chicago?—A. I believe so.

Q. Does that extend over the State?—A. I think there is a different system in this city from that existing over the State. There is supposedly a different system over the State. They are working a little different. There is very little change. I think there is a law especially for Chicago.

Q. (By Senator KYLE.) You would advocate the plan you suggested a moment ago—a modification of the present system of scheduling property?—A. As long as we schedule property I would make it obligatory upon every man to make his own schedule and itemize his property.

Q. How often is your land appraised?—A. Every two years.

Q. So that the new improvements are added to the value of the property; how?—A. New improvements may be added each year.

Q. (By Mr. A. L. HARRIS.) The statement has been made that there has been a serious decline in the price of agricultural products in the last few years compared with 10 years ago?—A. I think so.

Q. With 5 years ago?—A. Yes; just about 5 years ago. You can go back just 5 years for the decline. They were as low 4 years ago as they are now; but 5 years ago and the preceding 5 years they were higher than they are now.

- Q. Is the tendency still to decline?—A. It seems to be at the present time.
- Q. Is that true with all classes of agricultural products?—A. All grain products.
- Q. How about live stock?—A. There is not much difference in that, I suppose.
- Q. Has there been any decline in the value of agricultural lands in this State in 10 years?—A. No. Agricultural land in this State is higher than it was 10 years ago.
- Q. The price is going up?—A. The price of land is. The price of products is going down.
- Q. (By Senator KYLE.) Land is rising, you say?—A. In the last 10 years. There has been no rise in the last 3 or 4 years.
- Q. (By Mr. A. L. HARRIS.) Land is no higher than it was 4 years ago?—A. No, I would suppose not; not as high as it was 3 years ago, quite. Very little change.
- Q. Any decline in the producing capacity of your soil?—A. Not for northern and central Illinois, and I think not for southern. There is an increase in central Illinois, rather than a decrease.
- Q. From what cause?—A. Rotation of crops, largely, and fertilizers.
- Q. Do you use commercial fertilizers?—A. None used in the State, as far as I know.
- Q. Barnyard?—A. And clover. Clover is the largest I know of.
- Q. And the increase in the production of the soil is brought about by careful farming?—A. Careful farming and tilling. That has been a great thing in the State among farmers. Many farms have increased one-fourth and some one-half by the mere matter of tilling.
- Q. You mean the increase in the productiveness?—A. The production of the farm.
- Q. Taking the increase of production into consideration, does it equalize the decrease in the price of the farm products over a few years ago?—A. Well, almost. I suppose not quite. It will not do so for the last 10 years.
- Q. Have you any statement to make in regard to the benefit of small farms?—A. It is a great benefit so far as the community is concerned, in my estimation, and, so far as school advantages and social advantages are concerned, it is a great advantage, and I feel it is a great advantage to the country at large. In other words, if every man were able to own his own little farm we would have a much better state of affairs than we have now.
- Q. Is there any advantage in the large farm over the small farm?—A. I think not. The only man that I know of that has made any money in the last few years farming is the small farmer.
- Q. (By Senator KYLE.) What is the tendency with reference to large farms now—to break up into smaller ones?—A. Not much yet.
- Q. We used to have 25 years ago what is called bonanza farms, like the Sullivan farm in Ford County and Champaign County. What has become of them?—A. Of course they are nearly all broken up, but in the last 25 years I suppose the ordinary farms have gotten larger rather than smaller. Of course Sullivan's and those like it have been divided up.
- Q. Those are the only ones that could be styled bonanza farms?—A. Yes. They have broken up.
- Q. Is there no tendency to aggregate quarter-section farms into section farms?—A. Not that I know of in this State.
- Q. What is your opinion as to the cause of the depreciation in farm products?—A. I presume there are several reasons.
- Q. You think there must be several leakages then?—A. I think so.
- Q. Which, if stopped, would materially improve the condition of the farmer?—A. I think one leakage is the transportation. I think transportation is too high, and that it costs too much to handle the grain; it costs the consumer because he is so far away from the producer; or, in other words, there are too many between the producer of farm products and the consumer. I believe the consumer to-day is paying about as much as he should pay, and that there are too many between the producer and the consumer.
- Q. Those called middlemen?—A. Called middlemen. Of course they must all have a living.
- Q. Are they feeling the depression?—A. I don't know how they could.
- Q. (By Mr. CONGER.) You say you think transportation charges are too high. Are they higher now than they have been in the past?—A. Not in the past, as far back as I remember. I don't know where it was many years ago.
- Q. Say in the last 10 years?—A. Very little difference. They fluctuate with us a little, sometimes a little higher than others. I think they are about the same.
- Q. You don't think transportation charges are lower now than they were 10 years ago?—A. I don't know. I never looked the matter up.

Q. Or 20 years ago?—A. As long as I have had anything to do with shipping the rates have averaged about the same.

Q. How long is that?—A. Probably 8 or 10 years.

Q. (By Mr. A. L. HARRIS.) That is, local rates.—A. Local rates are all I know about. I don't know anything about through rates—that is, I could not give figures here.

Q. Has the amount produced had any effect?—A. No doubt of it.

Q. (By Senator KYLE.) What has been the effect of the competition from foreign countries—Argentine Republic, Russia, and so on?—A. That has had quite an effect, there is no doubt of that.

Q. Those are variable factors, but at the same time are not the transportation charges a sort of a fixed factor?—A. Of course. In the last 20 years we have opened up great fields west of us, even in our own country, that we have come in competition with, and those things must all be considered.

Q. You say there are too many middlemen. You want to get to the consumer by the shortest possible course, is that your idea?—A. That is the idea.

Q. Have you any plan devised that you think will secure that?—A. Only, as far as agriculture is concerned, through organization.

Q. (By Mr. CONGER.) How can the farmers be organized for their own benefit?—A. By merely getting together and being organized. Somebody said the way to resume was to resume, and the way to organize is to organize.

Q. (By Mr. A. L. HARRIS.) What are the causes to induce the organization of the farmers?—A. Several causes; one cause being that everything else is organized. Some may say they are organized against the farmers, but I believe they are organized for their own interest. That one thing has forced them to organize. They see that people in towns and cities have better social and educational advantages; they see the only way out of it is to organize, to get together and discuss matters of mutual interest to them; not only the best manner of cultivation, but discuss the great economic questions, discuss transportation, the foreign markets, and all other questions that are of interest to the agriculturist.

Q. (By Mr. CONGER.) Are the farmers of Illinois better organized now than they have been in the past 10 years?—A. Yes, I guess. There are some organizations that were better 10 years ago; our organization is better now.

Q. (By Senator KYLE.) Is the Grange as effective as it was 25 years ago in this State?—A. I think it is more so, in legislation.

Q. You have effected some good legislation, then, as the result of organization?—A. We think so, State and national as well.

Q. Can you state some of the things you have accomplished?—A. Well, back some years ago we effected some legislation in regard to railroads, which is on the statute books to-day and known as the granger laws of Illinois, giving the railroads to understand that they are amenable to State laws. That was when the bill was up to reduce the passenger tariff from 4 cents to 3 cents. There was not a railroad in the State that obeyed it when the 1st of July came and the farmers carried it to the supreme court for decision, and the decision was given to the farmers. They have done that much, and the effects you know in the oleomargarine fights, the pure-food law, and the raising of the Commissioner of Agriculture to a cabinet position; and the organized farmers of this country are entirely responsible for free rural mail delivery, which is becoming more general all the time. I believe there are 5 or 6 stations in this State working satisfactorily. The organized farmers have largely instituted the farm telephone, which is going to be one of the greatest factors of civilization, if I might use the term, that has ever come about. In other words, it is going to bring the farmer into closer relations with the world than anything that has ever been invented.

Q. Is that put into use in this State?—A. Very largely, in different sections. We have a system in our section. There are 4 systems there with which we have reciprocal service. Right from my own home I can talk to over 200 families.

Q. In your county?—A. Not all in the county. I am very close to 3 counties. They are reciprocal lines under different systems. All that has been brought about largely by being advocated in organizations. That is a great improvement over the old condition; it is one of the great improvements; it is going to benefit the farmer; it is going to bring him into touch with the world. I would not have been here if it had not been for the farm telephone. Your message would never have reached me in time unless you had hired a messenger.

Q. You live out of the village?—A. Live out quite a way. It is going to keep the farmer in touch with the markets.

Q. (By Mr. CONGER.) Does your organization in this State attempt to assist the individual farmer in the marketing of his fruit or in the purchase of his supplies?—A. Well, we have made arrangements whereby he can purchase his supplies. The State organization is not in business for itself. It has made arrangements where he can purchase supplies at very satisfactory prices.

Q. The members of the grange have received some considerable benefits in that way in their organization?—A. Yes, those that use it.

Q. (By Mr. A. L. HARRIS.) What is the condition of the Grange in the State to-day, flourishing?—A. In a very flourishing condition, yes.

Q. Increasing in numbers?—A. Increasing in numbers. I have not the figures now showing the increase; the last reports show an increase, gradual increase.

Q. (By Mr. CONGER.) About what would be the approximate increase in the membership of the Grange in the State of Illinois?—A. Oh, I hardly know now what it is; it is not so strong as some. I believe it is, approximately, 20,000.

Q. (By Mr. A. L. HARRIS.) Now we come to the matter of the cost of transportation, which you think changes the cost of production, this cost of production including the interest account.—A. I can tell you pretty nearly what it costs per acre to raise a crop in our section of the State, and of course the same condition exists in other parts of the State. You know the condition of Illinois. There is a large strip of central and northern Illinois that is almost identical in soil and climate. In estimating the cost of production we could take account of interest, which will vary some, according to the value of the land. We consider that it costs from \$10 to \$11 per acre to raise a crop of corn and put it in the crib, counting interest on the money. Of course, that is land valued at \$80 or \$90 an acre.

Q. How many bushels of corn do you raise per acre on the country at large?—A. We seldom get under 40.

Q. (By Senator KYLE.) Will you average 50?—A. You can not take that belt to average quite 50.

Q. Down around Champaign is it over 50?—A. The Illinois average is 26.

Q. I know a good many around Champaign that get 60.—A. Some get 75.

Q. What is your average price per bushel?—A. Twenty-six cents now, I believe 27 in the local market.

Q. And it will run about that way all the year, and sometimes a little higher?—A. Yes. It was 30 this last spring.

Q. At 28 it would be \$14 per acre?—A. You are taking the garden spot.

Q. I am counting 50 bushels to the acre.—A. Count it at 26 and see where we are.

Q. (By Mr. CONGER.) Is your average of \$11 per acre a fair one for the State?—A. It would not cost them quite as much. It takes more work, but labor is not quite so high.

Q. (By Senator KYLE.) Is corn their crop? Is it not a fruit center?—A. Fruit and wheat.

Q. So you have to take them both; fruit is the staple crop?—A. Fourteen dollars; it is put for the whole country \$8—the cost.

Q. That is for the seven staple products?—A. I believe that is the way Secretary Wilson puts it.

Q. You say it costs you \$11 to raise corn?—A. From \$10 to \$11.

Q. That leaves you \$3 per acre, and at the same time you have had the interest upon your investment; a 160-acre farm at \$80 per acre is \$12,800; in addition to your \$3 per acre you get the interest at 6 per cent—if you think that is a fair rate—on \$12,800. You are in the banking business and also in the agricultural business at the same time.—A. Yes, if you always had that. It varies on the bushel. It costs from 20 to 25 cents a bushel to raise corn. That is the general experience in the great corn belt. I put it at 23 cents; but you must understand one thing: My estimate is putting it on the farm; it is not counting anything for the marketing; that varies according to the locality.

Q. You count the farm, I believe, of 160 acres at \$12,000. A man that is capable of running any other \$12,000 business his services run from \$1,500 to \$2,000, I believe, to manage the business.—A. He would expect that for his services. It requires just as good a man to run a 160-acre farm as it does to run any other business; so if you take that out, you have not counted anything for his services. The grain farmers in the last 10 years, take them as a class, in this State have really made but very little money. They have made a living; most of them make a good living, and they have educated their children.

Q. And have their capital left?—A. And have their capital left; but they have not cleared anything.

Q. Have they had as much worry about the possibility of failure as the merchant operating on the streets?—A. If you count a certain amount of worry—he can worry on a farm. He has the elements to contend with. If he knew in the spring what the weather would be he would know how and when to plant and plow, but he don't know anything about it; and if he fixes for a dry season he may have a wet one, and vice versa.

Q. (By Mr. A. L. HARRIS.) In your opinion, do combinations formed to control prices affect the prices of farm products?—A. I think so.

Q. In what way are they forming, and how do they control prices?—A. Well, they have never let me into the exact secret of how they operate a combination, but combination, as a rule, cuts off competition. We find right here that the grain elevators in my town in the last 5 years, I will say—and I guess I am safe—these elevators have not varied one-eighth of a cent. When you go to one man to sell grain it is not necessary to go to the other fellows; they are paying absolutely actually the same price. It is virtually the same as if we had but one grain man in the town.

Q. (By Senator KYLE.) That is, at the initial point of shipment?—A. Yes.

Q. There is no open market at all?—A. No open market at all. Sometimes towns vary a little; rates may vary a little on different roads; but the grain men themselves are paying about the same.

Q. (By Mr. A. L. HARRIS.) How many elevators have you in your city?—A. There are only the two at our shipping point.

Q. They are on the same road?—A. Same road.

Q. Owned by different parties?—A. Run by different parties. I think they are owned there, but it is pretty hard to tell who owns an elevator simply because there is a man in it; but I think these are both individuals. I think they are not company warehouses such as are scattered around.

Q. Have you any company warehouses in your section of the State?—A. No.

Q. (By Senator KYLE.) What do you mean by those?—A. A company is formed that owns a line of warehouses along a certain line of railroad.

Q. A company of nonresidents?—A. Yes, possibly.

Q. The company has a name?—A. Generally.

Q. What is the name?—A. That don't generally get out—about the name. All we know is the man that is running it. They don't generally tell anything about it.

Q. You know he is part of the system?—A. Yes.

Q. The headquarters of which is at a distance?—A. Generally.

Q. (By Mr. A. L. HARRIS.) Do they put up more than one elevator at the same place?—A. I have never known of it; they put them on the same line of railroad.

Q. If two elevators happen to be in the same place, do they try to get them to pool?—A. I don't know.

Q. If they find an elevator at that place, do they buy that one or build one?—A. They will buy if they can. They are trying to do that along the line. The Illinois Central, extending from the north to the south end of the State, is trying to buy the elevators, I am told.

Q. If you owned an elevator, and this company should come along and try to buy you out, and you refused to sell, and they should put up an elevator and commence business, what would be your end?—A. If I could compete with them, I would get along; but if I could not, I would go down.

Q. Would you expect the same advantages from the road that the company would get—the same terminal advantages?—A. I am always under great doubt whether I would get them or not, even if I expected it. I have never been able to get absolute proof, but I think there is a little advantage to big shippers.

Q. You say there are two men in your town, and they pay substantially the same price; but do they sell at the same place, and are they shipping to the same point?—A. Not always. Our local grain dealers now sell very largely right on the track, supposedly to some big shipper. That would go to substantiate my answer to your other question, that probably the big shipper gets a little rake off somewhere.

Q. (By Senator KYLE.) Do you think he would not gain anything by shipping on to the terminal point?—A. Well, at times they ship to the terminal point, but very largely now in our town they sell at so much on the track.

Q. Their belief being that the other fellow can afford to ship better than they can?—A. Well, that is the supposition.

Q. (By Mr. A. L. HARRIS.) You ship your grain to Chicago, I suppose?—A. Our grain mostly now comes here to Chicago. We ship corn south to the Gulf considerably.

Q. (By Senator KYLE.) To New Orleans?—A. Not this year. Our corn was not good enough for export.

Q. (By Mr. A. L. HARRIS.) You say there is not one-eighth of a cent difference a bushel between your 2 warehouses. How do you account for that?—A. That they don't want to work against one another. They know the grain has to come.

Q. Your supposition is that they have agreed on the price in the morning?—A. Well, they mostly have to do that. You and I understand the markets, and getting the markets here we know exactly our margin. They do confer sometimes. It was made up, I have no doubt at all—well satisfied of it as I can be, but I don't absolutely know.

Q. (By Senator KYLE.) Does each buyer get a card indicating the agreed price?—A. I believe so; generally a telegram.

Q. Where do they come from?—A. Different points where they buy. All go to the Chicago market, no matter where they sell. Our home market is governed entirely by the Chicago market, and that is what they sell at.

Q. Somebody must send out these cards?—A. Yes; I suppose they must.

Q. Do they come from the same party or different parties, if they come from Chicago, for instance?—A. I don't know. The cards look about the same.

Q. (By Mr. A. L. HARRIS.) If there is an understanding between your local dealers the Chicago man would not cut much figure, would he?—A. I don't know.

Q. Where, in your opinion, does the trouble exist, at this end of the line or at your end of the line?—A. This end of the line in fixing the prices, and that end of the line in working together without competition there.

Q. In your opinion the large elevator men substantially control the price of wheat in Chicago?—A. I think they do, very largely.

Q. Without regard to the price of wheat at other points?—A. Oh, no. Of course they are governed somewhat by the foreign markets.

Q. Is the present system of selling grain satisfactory to the farmers of your State?—A. Not very.

Q. Have you ever made a study of the difference between the prices in Liverpool and the prices at Chicago?—A. Yes.

Q. And your own town?—A. We have studied it up some.

Q. And what do you find to be the result?—A. Quite a difference. It is pretty hard to figure out exactly as to all the causes. Still there is quite a difference in favor of the grain man.

Q. As against the producer?—A. Against the producer.

Q. (By Senator KYLE.) Have you any personal knowledge of the operations of the elevator system of Chicago?—A. No personal knowledge, other than superficial knowledge. Of course, I know something about it.

Q. Do you express the general opinion of the people with reference to the institution?—A. That is what I have tried to do in the matter. I don't know what they call it. We call it gambling. On the board of trade I believe they have another name for it. Our people have never been able to see where it benefited the producer, although some of the members of the board of trade have tried to show us that it increased the price of our products from 20 to 33½ per cent. We haven't been educated up to that point yet.

Q. You have an idea that, but for the manipulations on the board of trade here, you would get a better price for your grain?—A. Sometimes it goes that way. As a rule, I do, yes. I think there is nothing gained by manipulating the markets. We realize sometimes. Now, at the time when they raise the price here by any manipulation on the board of trade, it very seldom affects the average farmer. At the time of the great corner, for instance, I remember the time that grain was sold here in Chicago for 35 cents more than it was sold the same day in my home town—just a certain condition in manipulation. Who did it help? It did not help the farmer; it helped the speculator. They had grain here, but no local buyer could buy on these markets because probably it only lasted 24 hours.

Q. (By Mr. A. L. HARRIS.) Have you, as an organization, ever attempted to have any legislation regulating public warehouses or elevators?—A. We have taken some action on that.

Q. Has your action been beneficial?—A. Well, it has never crystallized into anything definite yet, as far as legislation is concerned.

Q. This being the great grain center of the country, from a shipping point of view, could not you benefit your condition very greatly by proper legislation, after studying into the conditions that surround it?—A. That is what we have attempted to do, but we have never been strong enough yet.

Q. How much have the railroads had to do with this combination?—A. I presume they have had considerable.

Q. In what way?—A. Working on the inside, in this way. For instance, this new line of road being extended through the central part of this State is refusing to allow any individual elevators to be put up on that line; evidently they are working in with the elevator men.

Q. The company itself?—A. The company itself is refusing any land-grant privileges for elevator purposes to individuals.

Q. Are elevators being erected on the line of the road?—A. Not yet; it is not completed. There are to be. The lumber contracts have been let for the elevators. They have just begun grading the road in the last few days.

Q. (By Senator KYLE.) Have you any system of public elevators here in the State, public warehouses?—A. I have understood so. I don't know anything about it.

Q. Don't know anything about the law of 1871 regulating public grain warehouses, and the contest before the courts?—A. Do you refer now to the law by which they were not allowed to buy grain?

Q. (By Mr. A. L. HARRIS.) Yes.—A. I know something of that law. I understand they are not living up to it very closely.

Q. (By Senator KYLE.) Was it amended so that they could buy a few years ago?—A. That was the law. I thought you referred to an amendment, and whether our organization had done any work.

Q. (By Mr. A. L. HARRIS.) You spoke a moment ago about the effect of grain gamblers. I wish you would describe to the subcommission, as far as you can, in what way they affect the price to the producer?—A. You are speaking of a speculative market?

Q. I am speaking of puts and calls.—A. As I understand the farmers of the State, we have no objection to the legitimate work of the board of trade. We realize that that is a necessity, and we also consider that there is no advantage in selling more wheat in the city of Chicago probably in a day than is produced in the United States in a year; that the facts are misleading, and that the work and the manner in which it is done at present depress agricultural products.

Q. Does it rob the producer of the benefit of the natural law of supply and demand?—A. I think so. Supply and demand have something to do with it, but not altogether by a long ways.

Q. Have you studied into the working of the interstate-commerce law?—A. Not very much.

Q. How does your organization look upon the work of the Interstate Commerce Commission?—A. It was through the organization, largely, that the interstate-commerce law was passed; but there are probably some loopholes in it that were not expected by the organization to be in it.

Q. How were those loopholes made?—A. I don't know that I can define clearly.

Q. In other words, were they made by conflicting interests?—A. Most likely.

Q. Would there be any advantage in enlarging the powers of the Interstate Commerce Commission, in your opinion?—A. I think there would. It could be made of great advantage.

Q. Is there a demand among the agriculturists for that legislation?—A. There is a general demand, so far as I know, in this State for the Interstate Commerce Commission to have more power.

Q. (By Senator KYLE.) Do you think the law should be amended to permit the railroads to pool their freight rates?—A. Well, if you want to know what I think, I do not know whether we should have railroad companies or not at all, if you come down to that. I think the Government had better control them entirely.

Q. (By Mr. A. L. HARRIS.) Are you in favor of Government ownership?—A. I am in favor of Government control, if possible; if it can not control them, then I am in favor of Government ownership.

Q. (By Senator KYLE.) What do you think about the proposition to allow these people to pool their freight income, legally?—A. I can't see where any possible benefit can come to the producer. The benefit must be the benefit to the railroads, which undoubtedly there is. Individually I would be opposed to it on principle.

Q. Have you given that matter much thought?—A. We have talked of it.

Q. (By Mr. A. L. HARRIS.) If the rates were substantially fixed by the Interstate Commerce Commission, by consent of the roads, and they were placed under the supervision and control of the Interstate Commerce Commission, to see that the rates were carried out and observed as agreed upon, would you still have objections to pooling?—A. I would. In fact there would be very little need of it if it was carried out fully. Let each one take its own share. It would not make the difference it does now, of course, if you had a set rate that was carried out at all points.

Q. Do you believe in open competition with railroads as in everything else?—A. As in everything else.

Q. Are you in favor of a Federal pure-food law?—A. Yes.

Q. Have you, as between the different bills that have been introduced in Congress, an opinion as to which one would be of most advantage to the agriculturists?—A. I could not name it just now.

Q. Have you ever examined the Brosius bill, putting the matter in the hands of the Agricultural Department?—A. Yes, I have looked at it; I have not studied it very carefully.

Q. You think there ought to be some legislation at least in that line?—A. I think so; I think so.

Q. From the operation of the Federal and State laws against the spread of disease among domestic animals, do you think they have been sufficient for the

wants of the agriculturists?—A. They seem to be carrying them on very carefully in this State now, as to tuberculosis at least.

Q. What is the effect?—A. Have not been at it long enough to know. They are slaughtering lots of cattle.

Q. What has been the effect of the law upon the disease of pleuro-pneumonia?—A. It has reduced it very largely; stamped it out entirely in this State, so far as I know.

Q. Have you any, either State or Federal, remedial legislation that you care to suggest to the subcommission?—A. I think not.

CHICAGO, ILL., August 12, 1899.

TESTIMONY OF PROF. EUGENE DAVENPORT,

Dean of the College of Agriculture, University of Illinois, and Director of the Agricultural Experiment Station, Champaign, Ill.

At a meeting of the subcommission on agriculture in Chicago, Ill., at 10.30 a. m., August 12, 1899, Mr. A. L. Harris presiding, Prof. Eugene Davenport was sworn as a witness, and upon being examined on the topical plan of inquiry on agriculture, testified as follows:

Q. (By Senator KYLE.) State to the reporter your full name, address, and occupation.—A. Eugene Davenport, dean of the College of Agriculture, University of Illinois, and director of the Agricultural Experiment Station.

Q. How long have you resided in Champaign?—A. Since January 1, 1895.

Q. During that time have you been engaged as professor of agriculture in connection with the State University?—A. Yes.

Q. Have you examined the syllabus prepared by the subcommission on agriculture?—A. Very briefly.

Q. In looking it over do you find some items to which you could particularly address yourself?—A. Yes; some on which I have more information than others, of course. I have indicated on my copy here those which struck me upon which I have put the most study and have the most information; they are topics Nos. 2, 3, 4, 8, 23, and 24 in Part I; and upon the others I may have some information, but these are the ones that I know most about. In Part II, I have marked 26, 30, 31, 32, 36, 40, 41, and 44. In Part III, 49 and 50.

Q. Part I relates particularly to the labor employed by agriculturists. What do you say with reference to the comparative condition of parties employed in agricultural pursuits?—A. Does it relate to their condition now as compared with 40 or 50 years ago?

Q. Well, in former times; and state whether there has been an improvement, and so on.—A. Upon that I was going to remark simply that there seems to be a tendency to employ older men. There are more married men employed now on the farms than were employed a number of years ago, as far as my experience has gone.

Q. Twenty or 25 years ago?—A. Yes. Then there were more young men than now, although still the bulk of labor is young men.

Q. Would you characterize them as men under 30?—A. As between married and single, there are more married men now employed as laborers than there were 25 years ago.

Q. Both the husband and wife, you think, employed?—A. Oftentimes the wife affording some of the help in the way of housework.

Q. In this case is the house provided by the owner of the land?—A. Almost always the house is provided.

Q. What is the arrangement made, as a rule, for occupation?—A. Generally the man is employed for a year by the month, for a stated amount, and he is to have furnished a house with a little patch of land, perhaps a cow kept or something of that sort, with the understanding sometimes, with one of them, of course, that extra labor shall be boarded, and sometimes not. Oftentimes they are simply engaged for the labor of the season.

Q. What is the nationality of those laborers?—A. So far as I have observed most of them are American born, in the sections that I know most of.

Q. That is Illinois?—A. Illinois and Michigan. I am speaking of the two States I have known most of. I am speaking especially of Illinois now.

Q. Have you noticed that young men are coming from foreign countries, Germany, Scandinavia, and all those countries, seeking employment on the farms?—A.

Yes. I was speaking of these married men. A great many of the unmarried men employed on the farm are foreign born, especially German and Scandinavian, not from southern Europe as a rule.

Q. Is the demand as strong for employees along this line as it was formerly?—A. For agricultural employees? I think it is.

Q. Particularly this year, I presume?—A. Well, I think it is every year. There is difficulty in securing good men. The demand is, perhaps, for a better class of men than before, because of new machinery. The labor is more complicated than it once was.

Q. That might introduce the question now of the use of improved machinery along agricultural lines, and its effect upon the employment of help on farms, the quality of the help, and also whether it diminishes the demand for help.—A. Upon the first it has certainly called for a higher quality of labor; at least that some of the labor employed upon the farm should be of a higher grade, but not necessarily all of it. At least a portion of the labor on the farm should be of a better quality. Along with that has certainly come a state of affairs in which there is perhaps less manual skill shown upon the part of farm laborers than was at one time found. We do not have the expert cradlers, expert binders, expert men of that class, that we had 25 years ago, because there is no such call.

Q. I used to hear it stated here in this State 25 years ago, with the introduction of these twine binders and so on, that hundreds of agriculturists would be crowded out of employment, and they would be walking the streets, etc.—A. That was a very common impression, but I think it is entirely groundless. I think there is as much call for labor on the land as there ever was, and that the call is as sharp and continuous—that is, as far as my observation goes. The introduction of machinery has vastly extended agricultural operations; it has extended the acreage under cultivation, and has increased the amount of labor bestowed upon the land per acre. I do not think it has decreased the number of men or the total employment of man power on the lands of the country. In other words, it is not to be taken for granted that if a machine is introduced which can do the labor of 10 men, that 9 of them will be crowded out of employment. I would like to add in that connection that it is oftentimes forgotten that the amount of labor that may be put upon an acre of land varies between very great limits. It may be very slight in which the crop produced will be one of the gross crops, yielding very light revenue per acre; or it may be very great, yielding such a crop as sugar beets, or some of the more intensive products. I think the introduction of machinery has intensified the labor which has gone upon the land, enabled us to put more labor on our land per acre than we would otherwise be able to do.

Q. What is the general feeling amongst employees with reference to making farming a permanent pursuit?—A. That is very variable. I think the most characteristic point in it is what seems to me a decided change in the object before the laborer on the farm. Twenty-five years ago, and of course longer, a man generally worked upon the farm for the sake of getting a little money with which to buy some new land for himself and become a farmer. This man was likely the son of a farmer. But now that lands can not be had at \$1.25 per acre, or \$5 per acre, there seems to be a decided tendency for the farm laborer, if he is unmarried, to work for money without a very definite object, and this money is likely used for whatever his fancy dictates, most likely for a horse and buggy of his own.

Q. No object in life at all?—A. That would be putting it pretty strong, perhaps; but not a very definite object as compared with the object that stood before a man when lands were cheap.

Q. Not as a stepping-stone to some other business?—A. No.

Q. What have you noted with reference to the disposition of farmers' sons as to remaining upon the land?—A. That again varies greatly with individuals. It has seemed to me that there has been an increased tendency on the part of farmers' sons to leave the lands, but there have been many indications that in the last 3 or 4 years this tendency has received a check. I think there is to-day a stronger tendency on the part of farmers' sons to remain on the land than there was 5 years ago or 10 years ago.

Q. With the introduction of improved machinery, do you regard farm work in the line of drudgery, or is it so considered?—A. I don't consider it an occupation in which labor is drudgery.

Q. How do you regard it as compared with day-laborers' positions in the cities—plasterers, masons, and hod carriers?—A. I regard it as infinitely better.

Q. How do you account, then, for the fact that the cities are overcrowded with laborers that are seeking employment along these lines, with labor organizations, and that the farmers over the whole vast country to-day are seeking far and wide for help and can not get it.—A. I have jotted down three reasons that it seems to me are fundamental there. They are reasons that are not always mentioned.

First of all, I think a large percentage of humanity is strongly desirous of an environment that is exciting. It is more than simple companionship; it is a desire to be where there is much going on. The simple noise and bustle of the streets is entertaining to them; therefore those men enjoy themselves best where there are a great many other people; where there is a great deal of machinery in motion; where there is a great deal of excitement in the environment that is about them, and those men are lost when they labor alone, and therefore they seek this natural excitement. I think that is one reason. Another reason is that labor on a farm is more exacting upon a man in the range of ability that it requires of him than most of the labor of the city, which is organized and gauged in such a way that the labor of any one individual is comparatively simple. An average man upon the farm is expected to be able to do a great variety of things, and do them well. He must care for horses so that they remain healthy; he must care for his machine so that it will continue to run; he must know a good deal about crops; he must be a fair judge of the condition of the land, so that he may report this with intelligence; and the range of his ability should be somewhat broad. He is left a good deal to his own resources under the best and most exacting régime on the farm. It requires a better man to be a good farm laborer than it does to go into a gang.

Q. The ordinary man don't like to be a "better man?"—A. The ordinary man don't like to do anything that he is not compelled to do, and therefore he goes where it is the easiest—the line of least resistance; that is one reason. Then the third that I have jotted down is the apparently higher wages paid in the city. I say apparently, because the wages paid in the country are above the cost of living. The wages paid in the city include the cost of living; and there is the strongest tendency to compare the one with the other directly, as there is in salaried positions. The wage paid to the farm laborer is so much per month, and he is boarded, as a rule—as we say, "washed and found." In the city he gets a wage per day or per month that seems vastly larger, but he is expected to find himself, and of that cost of living he knows very little.

Q. It is an indefinite factor in his mind?—A. Absolutely indefinite.

Q. With a possibility, probably, that he can reduce that to a minimum and save probably more than he could on the farm?—A. He does not think anything about that, and he says, "I worked on the farm for \$20 a month; I can go to the city and get \$30 or \$40," and he goes, he says, "for higher wages."

Q. Is it your observation that this class of labor is better off than 25 years ago on farms?—A. In amount of money, yes; but I do not think that it is as valuable to them, because it can not secure so much land for them. It can not secure the opportunity for a man that it could 25 years ago.

Q. That is a question of the investment of his money?—A. It is a question of investment of his money and the opportunity.

Q. Would not the same thing apply to the man that takes a position with a street railway?—A. Exactly, but the wages are higher now than they were 25 years ago on the farm.

Q. So there is really no cause for complaint on the part of employees as to the treatment of the farm class of the population?—A. I suppose they would find cause for complaint. The farmer or landowner feels that he is paying everything for labor that he can afford, and that by the time he adds the cost of taking care of them, he is paying as good wages as other employers—all that he can afford to pay. I know that is the feeling of the farmers.

Q. Do you regard the position of the farm laborer as a good one for the person who is considered an unskilled laborer?—A. I certainly do; good in two senses. I think its income is good to him; and I think the surroundings that come to him are helpful and healthful; and I can not see why the same grade of labor is not as well paid on the lands as in most lines that I know of.

Q. Is there a better opportunity, in your judgment, for a young man to rise, to get to a position of independence in the laboring line on the farm than there would be in the city?—A. That depends, of course, upon the kind of a man. If he is a man that is able to control large interests, he will likely come into that control, I was going to say, in the city more readily than in the country; but of the class of men that we call laborers on the farm, and who would remain laborers in the city, even laborers of good grade, I think it is decidedly true that the farm laborer has a better opportunity to become a better citizen and a man of influence in the country than in the city, as far as my observation has gone.

Q. The tendency has been for 25 years the other way; even farmers' sons were desirous of getting off the farm. What do you notice as to the disposition of farmers' sons now?—A. I know a great many who have trained themselves for the technical professions, as, for example, electrical engineering, which is a new profession and calling a great many men. I know a great many of them who have fitted themselves for this business and have abandoned it very quickly and gone

back to the land. These were sons of landowners who are not to be considered as farm laborers simply. There is a growing appreciation of the value of land to the landowner.

Q. Within the last few years?—A. Five years.

Q. Formerly—25 years ago—the young men were very anxious to get away from the farm. What do you assign as the reason for that?—A. I think the anxiety was stronger 15 years ago than 25 years ago. The reason for it, it has seemed to me, was a complex problem. In this country we have experienced a wonderful development along mechanical lines, and the American is naturally a mechanic. He is skilled in mechanical matters away beyond most other nationalities. The demand that has come for good men for these positions almost necessarily has come to the American boys, I think. It has not come in a good sense to the foreign immigration. That is one thing. There has been an immense tide of foreign immigration that has in a sense competed with common labor, and to some extent on the farm, especially the Germans and Scandinavians of the Northwest. Until the last 5 or 10 years the occupation of farming has hardly been considered a scientific pursuit. The drudgery of the farm has been wonderfully lessened during all of that period, so that the whole business of farm life and farm labor has taken on a new aspect within the last decade. The two things together, I think, the sharp call for young men trained along mechanical lines, coming at the time of the largest development of our lands by unskilled methods, involving a great deal of drudgery, have operated to keep a great many American boys off the lands.

Q. Do you think there is a feeling amongst the American young men that farming, as an occupation, is one of a degrading position—a menial position?—A. A great many of them feel that way.

Q. Why are they made to feel that way, in your judgment?—A. Well, agriculture, from the Middle Ages anyway, perhaps—

Q. (Interrupting.) Biblical history has given the first phase, has it not?—A. Yes; but after the fall of the Roman Empire, and during the days of the Roman Empire, agriculture was largely the occupation of the enslaved, the conquered nations; and in almost all the European contests—and our civilization is European—the conquered were put upon the lands as laborers; and I think there is a kind of inherited feeling that gentility goes along with government position, military, law, or something of that kind. That is one thing. Then, again, the farmers themselves have fostered this feeling. They have rather accepted the position as to its being an inferior calling; not that they have been willing to accept it so. They have galled under it, but they have accepted it in the family as a part of their life. There is a reason for that. This country has been undergoing an intense and very rapid development, especially in the last three decades, after our recovery from the war. That development, the intensity of it, and the rapid changes that are involved in it, seem to require frequent meeting of men interested in large enterprises. This tends to form centers of population more favorable to rapid conduct of business than in scattered populations. It is well illustrated by the fact that farmers have only within the last 5 years commenced to take daily papers—only been able to get them within the last few years. And only recently have the farmers commenced to really concern themselves with all the questions that interested the country; only recently have they commenced to feel in their bones that every other occupation in this country is interested in agriculture; and there is coming a self-respect among farmers that is not very old; it is new. I think that this native feeling that farming is a somewhat ordinary and, perhaps, a degrading occupation has been fostered sometimes by local politicians during the campaigns. They have considered it good political capital to inform the farmers that all of the other occupations were combined together against them, and they have accepted it as being true, because it was told them by men who ought to know.

Q. He has been made the butt of ridicule by newspapers and politicians?—A. Cheap politicians.

Q. And comic newspapers?—A. I think, as far as my observation goes, that even yet the average farmer has no conception of the light in which agriculture as a business and as a productive industry, or in which agricultural people as a part of the great American commonwealth, are esteemed by the leading men in the country.

Q. Where do the comic newspapers get that idea? When they wish to put a man up as a butt of ridicule before the country they dress him up as a farmer. Is it because the farmers are as a class ignorant, or because his calling is considered by them as degrading?—A. It is a literary habit. Why is it that a storm at sea is described always in the papers after a fashion that nature does not imitate? We have our literary Dutchman, our literary Irishman, our literary negro, that have

very slight existence in fact; but he has gone into the papers and on the stage until we accept him as a real natural product of the world, and a typical specimen of the kind. In the same way we have the literary farmer; that is, the farmer—if it ought to be literature—constructed by men who know little and care less about what the occupation of farming is, and he has his language, his dialect that is ascribed to him. His spelling is always bad in order that they may bring out the language of the typical farmer.

Q. The typical farmer of 100 years ago or 150 years ago?—A. The typical farmer of 100 years ago was almost exclusively a Yankee, and he has passed out of existence.

Q. The grade of intelligence is rising?—A. Yes, it is rising. It is different in every sense than it used to be. Now the agriculture of America is represented more especially by that great section that lies west of the Allegheny Mountains and east of the Rockies. There is a population that is now made up of a mixture of the New England type, the Dutch from Pennsylvania, the old English aristocracy from Virginia, and some of the southern element, with the addition in the North of the Scandinavian immigration; it is a great mixture, and there is built up in this great agricultural section a class of people that has no parallel in the world as to blood lines, and as to activity, and as to the lines of development.

Q. And was it not formerly looked upon as a business a man could revert to when he could not do anything else?—A. Yes, and in a sense it is true. The land is kinder to its occupant than any other industry. One can go upon a very small piece of land and secure an existence with less effort, I am satisfied, than would fill his stomach in any other calling; but that is not farming in the American sense of the term. There has been a great confusion in that thing, that possibility by which a man of very low order of intellect and knowledge, low capacity of all kinds, could go upon a small piece of land and live, and not starve to death—there has been a great confusion between that thing and what is the typical American farming; an occupation, an industry, a profession just as truly as the law or medicine or the ministry or any other profession of man, or any other money-making enterprise—an enterprise which has for its object the development of the family, their education and their advancement.

Q. You think that would lead us then into a changed condition, the bettering of the condition of farming lands, to scientific farming in the technical sense, and the education necessary to ameliorate the conditions?—A. It would. This one class of people that occupy the land, who are there by accident, are to be compared, I think, strictly with the class of people in the cities that are in the slum districts. They are the accidents. I do not think they are to be looked upon as normal land occupants any more than the people of the slums are to be looked upon as normal city residents. I think attention should be directed to better lands, the class of men who farm for an object which is a little above that of simply existing; and there is need of scientific methods.

Q. You can elaborate somewhat on the adaptation of our public-school curriculum, the technical training in our public schools and universities, and the education of the common schools?—A. I think we had better begin at the upper end of it, the technical education in the colleges or universities, and speak later of the common schools, if we may, because there is where the work commenced. Secretary Wilson said to me last fall in his office that our method was surprising to foreigners; that the American Government is interesting itself officially in agriculture in three ways: First, in collecting information about agriculture as a mere commercial enterprise, perhaps, as other countries are doing; second, in actually investigating the principles of agriculture through its department in Washington and through experiment stations in different States, which is almost new to the world; and third, through the establishment of colleges in each of the States, where these principles are taught; this last way almost peculiar to America. The colleges of agriculture, founded upon the land grant of 1862, have been attempting to discover and to teach the principles involved in this great business. It was 20 years before they succeeded to any reasonable degree, because the principles must be discovered before they could be taught, and not enough was known of agriculture to even outline a proper course of study. The subject-matter of instruction was not known. The first attempt was to simply recite the practice of the country as it was at that time to young men, and tell them how to do these things; but later on, with more experience, and especially with the establishment of experiment stations, there has developed an immense literature in agriculture covering the principles involved, which has only commenced. There is more unlearned than has yet been learned, vastly more. But there is enough now upon which to base a strictly scientific course of study, and the student sees now that he is dealing with scientific problems all the time on his land, and that he may in all honesty

do a hard day's work upon the land which is a money loss to him; he may better have been in bed and asleep, as far as money is concerned, than doing that day's work. In other words, the student realizes now that he is dealing with live problems all the time; that his plants are living things; that the soil is alive; that he is liable to do damage as well as good by his labor, and that labor must be bestowed at the right time and with a definite purpose in view, scientifically. This is necessary if we are to develop agriculture strictly as a profession. As we are practicing these things in very recent years we are hearing a great deal of complaint from the farmers themselves who neglect to practice them; as, for example, in the dairy business, with the invention of the Babcock test, by which the actual butter production of an individual cow can be learned for each year of her life if necessary. For the first time in the history of the world the farmer was able to tell which cow was producing butter and which one was not; which one was making him a profit and which one was making him a loss; and the farmers have actually destroyed oftentimes as many as 25 per cent of their cows and found that they were producing more profit out of their herd than when it was 25 per cent larger. This will force other dairymen to do the same thing, because the first resultant of it would be a cheapened production of butter, and those who neglect to cull out these bad cows will, of course, be unable to produce in competition with them. This is an illustration. The same thing is going on in other lines. We have at the university a piece of land that has produced corn each year for over twenty years; it is prairie land. Last year and each year the amount of corn that it produced per acre was only about 50 per cent of what is produced by other unmanured land which has been devoted to diversified farming during this time.

Q. You mean this 20 acres has been destitute of fertilizing?—A. It has been. It has simply been drained dry; no fertilizer has been applied to any of it in the last period of 20 years; but this piece of land has raised nothing but corn each year successively—corn, corn, corn. Last year we raised corn, if I remember the figures correctly, according to the statement of Professor Holden, that cost us all the way from 15 cents a bushel up to 45 cents. The difference lay in the character of the land which was devoted to corn; and that difference depends upon the previous treatment of the land—whether it had been devoted to one crop or not, the amount of labor it took to produce a crop on that land, and the resulting crop, both conspiring, of course, to affect the cost of production. All these things make it seem absolutely essential that the successful land operator of the future must be well acquainted with the scientific principles involved.

Q. Do our young men take to this scientific farming in our universities?—A. They have taken well to those courses of study in the colleges of agriculture separate from the university. For a long time the universities failed to see that agriculture is a subject to be studied by itself, from its own standpoint, like every other subject. The universities where, from the nature of the case, the problem of education is complex, were longer in recognizing the proper basis upon which agriculture should be studied than were the agricultural colleges, where they had but one problem to work out, and that was how to teach agriculture. But latterly a large number of the universities have caught the idea that agriculture is a thing to be studied by itself and for itself, and have put in very strong departments of agriculture. As they have strengthened those departments and have actually given scientific and sound instruction students have responded just about in proportion as the instruction has been valuable or not.

Q. The experience of the University of Illinois, I presume, has rather been to develop the other lines, has it not?—A. The other lines have developed much more strongly.

Q. The institution, as I remember, started as an agricultural institution?—A. Agricultural and mechanical.

Q. And rapidly developed into a university of the first class, and agriculture took a rear seat?—A. It is the most natural thing in the world, because if an institution of that kind is started as an industrial university—and that was the name under which the University of Illinois was started—the word "university" gives an occasion for introducing any subject in which the people may be interested. Now, of all the subjects introduced in such an institution, agriculture and the mechanical arts are the new ones. Since the founding of these colleges and these universities, as we all know, we have gone through the most active period of mechanical industry, and the problems of mechanics and machinery are simpler than those of agriculture; they can be subjected to mathematical demonstration very largely; they are quicker worked out; and so, as between agriculture and the mechanical arts, in almost all our schools the mechanical arts have developed much more rapidly. In both subjects they must discover their own material before they can teach them; but in agriculture the problems were much more complex, involv-

ing the nicest questions of chemistry, botany, biology, physics, and geology, as well as economics. The development has been much slower in the discovery of really teachable matter, and not until the last 5 or 6 years can we say that really good matter has been given to our students of agriculture in any of our institutions. We are developing rapidly now at the university along agricultural lines. In every case, I think, where they were separate, where the college of agriculture stood alone, distinct from the university, it has developed these problems much more rapidly than where it is connected with the university under the same board of managers or the same administration, because where the college is distinct it has but one object in view—to develop agriculture. Where it was a part of the university agriculture was but one of forty, and of course the problem was much more complex. Our universities ought not to be too severely criticised if their development of agriculture has not been so rapid as in the colleges. In the end they ought to do better work in agriculture than the colleges can do, because their associations are freer; the environment is better. I do not think that in the universities, as a rule, there is any prejudice against agriculture as such. They have been compelled to admit that a good deal of the instruction given was poor, but there is a growing respect for the subject of agriculture and for the agricultural people.

Q. (By Mr. J. C. HANLEY.) I would like to suggest a question; I would like to ask the question how many of the graduates of agricultural colleges really go back to the farm and to the conditions of farming, to pursue the business of farming?

Q. (By Senator KYLE.) And what is the report of those young men after they have gone back to their homes?—A. Well, it is a long question to answer; the answer to it is a long story. The Michigan Agricultural College was the first of the kind in America, and we can get better data from that than any other. It was established before the Government aid came, and graduated its first class in 1861, and this ground was all fought over in the history of that college years ago. So often was this question asked that the college authorities took a census of its graduates and found that a little over 50 per cent of them were in agriculture. This census was taken about, roughly speaking, 25 or 30 years after the establishment of the college. The assertion is made that this is a very small percentage, that they ought all to be on the land.

Q. Was that distinctly an agricultural college?—A. That was distinctly an agricultural college.

Q. The supposition is that they did not all take the training with reference to going on the farm originally?—A. Well, that is a question; nobody knows about that. Personally I knew of many men who came to the college without the remotest idea of going on the land, because it was a cheap course to take, and I knew of many of them who did go on the land afterwards; but when it was discovered that about 50 per cent of the men were upon the land after the college had been running 25 or 30 years, the statement was made that it was a bad showing, that all or at least most of them ought to be there; but the college authorities made a careful study of the proportion of graduates of purely technical schools that followed through life the calling that they were educated for, such as lawyers, doctors, and ministers, and they found that they did not run as high as 50 per cent. So the Michigan Agricultural College makes the claim to-day that it has a larger percentage of its graduates on the land than have the technical schools, that follow their occupation through life.

There is another feature that I want to discuss a moment; some things must be remembered in this connection. It takes capital to own land and to operate it. A great many young men, sons of farmers, will say: "My father will help me to get an education; that is all he can do for me;" and we graduate a young man out of a college of agriculture with an agricultural training. What shall this young man do? There has been a great tendency for these young men to teach school or do something else for a number of years, in which they thought they could make more ready money than they could by doing ordinary farm labor. An investigation was made into that class of people, and it was found that of the other 50 per cent that were not on the lands, in a large proportion of the cases these men were landowners if they were graduates of long standing, and those of recent standing, in nearly every case, said that they proposed to own land as soon as they could afford it. But it is a more difficult thing for a man to acquire landed property and follow up the business of farming from nothing than it is to build up the business of the law, for instance, which does not require a very large capital to start with; and that must be considered as bearing on this question.

Q. How is it if he starts in as a renter and goes on through?—A. There is a great tendency to do that now, as lands are offered for rental. There is the greatest tendency for young men who are up on those things to rent that land, and I think the owner is ultimately the loser.

Q. I would like to know what report the university got with reference to the success of the 50 per cent. Had they been, on an average, more successful than the ordinary run?—A. Yes; much more successful. And we found that, generally speaking, these men were centers of better methods in their own communities; and that is more true of the recent graduates than of the earlier ones, when the principles of agriculture were hardly known.

Q. The time is not very long since when if a man set up like that in a township they would all make fun of him?—A. Oh, yes; they commenced that way; but now we send out our men with much more accurate knowledge than they went out with 20 years ago, and the whole sentiment toward what you might call the "educated farmer," or toward "book farming," has entirely changed in the last decade. They do not care who the man is or where he comes from. If he knows a thing, they are glad to learn it from him.

Q. (By Mr. HANLEY.) Of that 50 per cent that you say the report showed took up agriculture as a profession, how much of that was taken up by, you might say, teaching, such as professors in colleges, teachers of different lines of agriculture of teachers in schools, etc., while nominally living on the farm at the same time practicing other professions?—A. Of this last class, those living upon the land, but actually teaching local schools?

Q. Yes.—A. Almost none. Those men don't do that. In this particular instance of the Michigan Agricultural College—this college has, more than almost any other, supplied professors for other institutions, because it was older—I can not give you the figures as to how large a share of these were professors, but I can say this with respect to other colleges than the Michigan Agricultural, like Wisconsin, for example, that they are all upon the land. The teaching of agriculture in the universities, I should say, is more technical than that in the colleges of agriculture. The student does not take an agricultural course in the university unless he expects to go upon the land, and he almost always does it. As to our students at the University of Illinois, our agricultural students, they are all land men and will go upon the land, every one of them, excepting now and then one who is picked out for an instructor somewhere, and the call is sharp for them. So you may say that of the students in the university, the students of agriculture represent just about that many prospective farmers; they nearly all go on the land.

Q. (By Mr. A. L. HARRIS.) Is the tendency to support agricultural colleges greater than it was?—A. Vastly so.

Q. A growing interest in this matter?—A. Yes; and that is largely expressed by this public sentiment which suggests the topic of the curriculum of the common schools in your plan of inquiry. There is getting to be an intense call now.

Q. You consider that the money Congress appropriated to these agricultural colleges is not wasted?—A. I think it is the best investment of money the Government ever made, whether you consider the upbuilding of agriculture and the cheapening of our products, and the retaining of the fertility of the land, or whether you consider the good of the man that is occupying the land. I would say that, of all these things, I think the last two are the most important. This race has been in the habit of going west upon new lands ever since it started from India. We are about done going west, and here we must stay on these lands and work out the future of this race, probably. Now, the problem is not so much in agriculture how to produce this corn a cent or two a bushel cheaper, or how this generation shall make money; it is also, how shall the fertility of this land be protected for a thousand years; what rotation of crops, what system of farming shall be inaugurated; and, secondly, what shall be the class of men that shall occupy and control the management of this land? Under a system of farming by an American peasantry we shall lose the fertility of these lands undoubtedly.

Q. (By Senator KYLE.) Have we not lost that already in 200 or 300 years?—A. Yes; we have done that.

Q. I noticed over in England wheat growing 8 feet tall on land that they told me had been farmed for 1,500 years.—A. Yes. Now, it is a well-known fact that agriculturally good land will grow better and more productive under continued farming if the management is good; so it is infinitely important that these American lands be managed by men of ability.

Q. (By Mr. A. L. HARRIS.) Do you ascribe the decrease in the productive condition of the soil in the older States to nonintelligent farming?—A. Yes; very largely I do. American farming, until recently, has been almost exclusively a problem of raising cheap crops, and the management has been mostly directed to the labor involved, without much reference to the effect upon the land and the preservation of its fertility.

Q. (By Senator KYLE.) You think a man can farm 800 acres and get a crop off it; but he can not farm 600 acres and put back the necessary fertilization into the

soil?—A. That question, by the scientific principles involved, suggests the fact that he can get as great a revenue per year off that 800 acres and make the land grow better as he can and let the land grow worse.

Q. (By Mr. CONGER.) Do you think the farmers of Europe, or the peasantry there, are more intelligent or understand the soil better than do the American farmers?—A. I do not think they do. I do not think their knowledge of the soil compares with ours.

Q. What is to be the fate of those foreigners who are now, according to reports, coming into New England to take up those abandoned farms?—They will doubtless succeed pretty well, many of them.

Q. On what theory?—A. Because their cost of living is infinitely lower than ours in the West. It is the only way in which they can do it. The needs of the American farmer are rather high, and we are all interested that the farming of the great sections of good land shall be done upon a scale which will enable the farmer and his family to become educated, travel some, and become good American citizens. The foreign peasant has not that ambition. He comes more, as the other class I mentioned, with a desire of simply living. The better class of foreign people have gone into the Western lands, and have succeeded very greatly and become wealthy. The Scandinavian element of our population is ambitious for land and money; so is the German, and it succeeds. Now those who are willing to stay on the abandoned farms in New England are very largely of a different class, but I have no doubt they will succeed as well or better there than they did in Europe.

Q. Why have the farming lands of New England become so depreciated in fertility as compared with Europe, where the land has been used for a much greater period?—A. The New England lands are rolling, most of them, and they never were immensely fertile; they were fairly fertile lands, and some of the river valleys, of course, were very fertile; but the American is a pretty good tiller of the soil; he gets the soil in shape to raise a maximum crop at any cost to the land, and he runs his land pretty hard. They used to dump the manure into the river in the Mohawk Valley to get rid of it—considered it rubbish; and the American has never taken kindly to the use of manure, never believed in it. He found here a wonderfully fertile soil and he believed that it would last forever. The European peasants had learned by sad experience—they are recovering from the experience they went through several hundred years ago, when the land was so impoverished—that they must use manure; and they do that, and they raise fairly good crops. Take the agriculture of Belgium, la petite farming; it is of its own kind. It is successful measured by the type of man and his needs and desires. It is not successful measured from the American standpoint. Its returns are not sufficient, and that kind of labor, that kind of man, would not occupy our best soils to good advantage. He must stay on land of moderate fertility, and, of course, the product will be moderate. There is no way, I will say, so far as anybody knows now, of developing our poorest lands into strictly high-class farming lands. If it is ever done it will be in the indefinite future, and only after these better lands have become more exhausted than they ought ever to be allowed to become. The tendency of the world has been to retire—I mean now, for the typical farmer—to retire from the poorer land on to the better land rather than to put more labor on naturally infertile land; and what you can get out of poor land depends more upon the amount of labor than it does upon the land.

Q. Is my observation correct that many of the foreigners, that is, farmers from Europe, Germans for instance—have, as soon as they came here, had a higher idea of the value of manures and of the necessity of keeping up the fertility of the soil?—A. Oh, yes; and they have a higher idea of the value of fertility and of land than the Americans have.

Q. And you think possibly it is that superior knowledge, natural or inherited, of the value of manures, and of the necessity of keeping up the fertility of the soil, that will make the foreigner successful with these New England lands?—A. I think it will.

Q. (By Senator KYLE.) Do not the landlords stipulate in their contracts with these men that they must manure the land?—A. They are doing that much more than they did.

Q. That is, in foreign countries they are conversant with the subject?—A. A few agricultural occupations have been very carefully studied in Europe, as, for example, the production of beet sugar. That rests upon a scientific basis, well worked out by scientists in advance of its practice on the land, and we get from Germany now the most skillful sugar-beet growers that the world has known anything about; but it does appear that when they come in competition with our people here, the American is able to beat them when he puts his mind to it. For example, in Illinois the study of the growth of sugar beets is peculiar. They

spent last year in learning how to grow beets in a half a dozen different localities in Illinois. The best men in those localities formed a temporary company, put up some money and employed an expert from Germany to tell them how to grow beets in advance of building any factory. This year there was one large factory built at Peoria, one of the largest in America, and it is said now that the farmers in the neighborhood of Peoria are growing better beets than the company is growing upon other lands that they have rented and upon which they have put supposedly expert-beet tillers brought from Nebraska, and some from Germany.

Q. (By Mr. CONGER.) You refer to this season's crop?—A. I refer to this season's crop. In other words, the Illinois farmers this season are producing a better crop of beets on their farms as the result of one year's study of it than is grown by supposedly skilled labor from Europe.

Q. Does the State of Illinois give any encouragement to the cultivation of beet sugar in the way of bounty?—A. No; none whatever. Now, a little more on this other question, this technical education. I would like to say, if I may, that it is believed I think by those who have studied it the most, that this elementary training for agriculture should be carefully guarded. We should do better than the European agricultural school that aims principally to train the boy in methods of practice. We are believing here that we must take care of the citizen at the same time. We must turn him out a pretty well-trained man, so that in our course at Champaign a man graduates when he offers the same number of credits that entitle him to graduation from any other course in the university. One-third of them must be in technical agricultural subjects, one-third must be in science, and the other third he can select from anything the university offers. We do not say he shall not take that other third out of the agriculture. He may if he desires to do so, but we do not advise it; and in practice they will generally elect more agriculture than we require, and they will use about a quarter of their time for other subjects. That is an important difference in American colleges as compared with European.

Q. (By Senator KYLE.) What have you to say as to the curriculum in the common schools of Illinois, and its adaptability to the needs and wants of the farmer?—A. This is such a new subject that anything that is said upon it, I think, by anybody will be largely tentative. The demand seems to be for agriculture in the common schools. That is a term that is used a great deal, and it would look as if it were a call for technical instruction in the common district school in the matter of agriculture. Whether that is what is meant, I am extremely doubtful. One thing is certain. It is absolutely impossible to get it for an indefinite time to come, owing to the lack of teachers. We can not get teachers for our colleges that are up in what is known already as well as they ought to be, and the great bulk of what we would like to teach must be yet discovered; so that it is too early yet to give very much strictly technical instruction in the common schools. But I am one who believes that the appetite, when fully analyzed, is not so much for the actual principles of agriculture as it is for a curriculum which comes closer to the life of the student. Most thinking farmers say that they send their children to the schools knowing a good many things already. We all know that the life of the boy and the girl on the farm is a full one. The child comes in close contact with the business life of all the family every day: knows horses and cattle and sheep and plowing and cultivating and husking and harvesting; knows a multitude of things. Now the farmer complains when he sends his child to school that he sends him into an artificial world, having absolutely no reference to the matters upon which he already has knowledge; no reference to the affairs of the country and of rural life; that the child is living in an atmosphere that has come down to him from the schools and from very ancient times, which is largely literary and is decidedly unagricultural. I think all he asks for is that a portion of the instruction of this student should deal with the affairs of the country, as it deals with the affairs of literature, history, mathematics, and the sciences. I think that is what the appetite really needs, really calls for; so that this boy and this girl should actually study what is going on in its neighborhood, what is going on upon the land, study the habits of animals, and let his education begin where his experience leaves off, and be coordinate with it as it goes on. This work is probably well started in a tentative way in New York under the Nixon bill, in what is known as the nature-study work.

Q. Does that relate particularly to the public schools of the State?—A. The public schools of the State, and it aims directly at the students in the school, not the teachers, but directly at the students, and aims to enlist their attention to the things that are around them, to observe those things and study them, believing that not only inclination but training and sympathy with country surroundings will come from those influences. Farmers say this, that the family life on the

land is so closely identified with the business life of the farm that the child learns to know all the business hardships in the country, whereas in the city he does not; and then when he goes to school he is given to read day after day the story of the few phenomenally successful men in the world in some other than agricultural lines. So the boy reasons: I know this is a hard life of my father's; I see it; he gets up early, he works hard and late, and he never will go to Congress—never heard of a farmer that went to Congress. He has not heard of those that do go; he is not told of it in the books; but here he reads of this man, then of another, and then of another that left the farm and after a series of hardships succeeded. He is not told of the nine hundred and ninety-nine that did not succeed, and he is not very well informed of the hardships which they went through. So the feeling is that this child of the country through his life on the farm and his instruction in the schools is brought face to face with the hardships of one life, strongly impressed with them, and only with the phenomenal successes of other callings. And I think there is a call that these young people should be better instructed in the normal features of country life.

Q. Under Part II we have a very important subject—the comparative earnings of capital invested in agriculture. What have you to say in regard to the earnings of capital compared with 40 years ago?—A. Well, this is the thought I had in mind under that head; it is a subject I can not discuss fully, but there is this to be thought of: Much depends on the way capital is calculated. Forty years ago, or even more recently than that, 100 acres of land bought from the Government would represent a capital of about \$500—\$1.25 an acre. That is all a man considers he has invested. That same 100 acres, to-day, if good land, is worth possibly \$100 an acre in a good section. He considers, then, that he has \$10,000 invested in that land. Now, it is a question of how he calculates capital. If we consider that this man had \$10,000 invested in this land, I am satisfied that the returns are smaller, reckoned on that capital, than were the returns 25, 30, or 40 years ago, reckoned on the capital invested at \$1.25 an acre; but I do not think it is the fair way to figure the capital invested. If a man must purchase the land at that figure, then it becomes a fair way of figuring the capital invested; and then it is a serious question whether a man can afford to buy land at that rate and then say that his income is as great as it used to be. But it is apparently great enough, so that men are willing to pay \$60, \$75, \$80, and in some cases \$100 an acre for land.

Q. If a man has \$10,000 to \$12,000 to invest, and he decides to go into some line of business, the question is whether he shall invest it in agriculture or buy a stock of merchandise. Why does one man choose the farm and another the merchandise?—A. I think it is not so much the question of investment as of personal choice, place to live, or something of that sort.

Q. Is there not some compensation in the security upon the one hand—the freedom from worry, etc.?—A. Certainly. If we attempt to compare the profits from land with those from the mercantile business, and restrict ourselves to the eminently successful merchant, then, of course, the income from land will not compare; but the land investment is more in the nature of a permanent investment; some income is certain. There is no such thing as the owner being "out of a job," out of employment; he is bound to have some returns. To be sure, some years he may not make any very large net returns, but he is not at all likely to lose his capital or to impair it, except by bad management. So that while I do not know very much about the returns from the mercantile investments, he would suffer more in the mercantile business by losing his capital. Some merchants lose all their capital very quickly. There is another way of looking at it. There are very many excellent families, average families of 5, on 80 acres of land, that are living good successful lives, dressing comfortably, educating their children, many of them in colleges, helping themselves through sometimes, it is true, but instances are common in which the family on an 80-acre farm as a whole is surely progressing, and the sons are being left better than the fathers commenced. Now that is a small investment of capital. He invests his time; he never will get wealthy, he never will have a large bank account, probably none at all; but his 80 acres of land, with one man's time, has apparently, at least, supported that family, and supported it at an increasingly comfortable rate. And either we must reckon pretty large pay for that man's time, as compensation goes in the world, reckon a pretty large return for his capital invested, or else reduce the apparent expense of his living to a very small amount. There is a lack of appreciation in this country, although it is beginning to manifest itself, of the value of landed possessions to a family. I find that my students in no case have ever thought on that subject. I never have seen a student who has. We in America are developing so rapidly and so much appears to depend upon individual effort that each man seems to think that everything depends upon what he does. Of

course, it will not depend so much upon his effort after a few generations as it has in a new country under pioneer conditions, and I find that they have not thought very much upon the value of this land to the family. We can not strictly compare a mercantile business with farming, for the reason that when the merchant leaves his business he has left nothing behind to his sons or to his next generation but his stock of goods and his good name.

Q. And the stock of goods not always paid for?—A. Not always paid for. But it is not a family legacy; it is not a possession that will insure that family a foothold in that country, however well managed. If a single individual in the family line fails to be more than ordinarily successful the trade is lost to the next generation of that family. It is not so with a landed possession. If a family can stay upon the land for 4 or 5 generations, it becomes a power in its own locality—the family name becomes powerful, and that is an advantage that is not figured.

Q. Could you touch upon our present system of taxation and give your opinion as to the proportionate taxes which the farmer pays, and whether it is just and equitable or not?—A. I do not think it is, but I have passed over it because I do not possess any large amount of definite information, and what I can say upon it is no more than what a thousand others might, and what is very evident, namely, that all the farmers' property is clearly open to inspection. The assessor, under our present system, is one of his own neighbors, and he knows exactly how much personal property he has as well as how much land he has and what the property is worth, and it is all assessed.

Q. He is compelled by law to itemize it exactly?—A. Yes; and as an assessor I have personally chased a hundred-dollar note until I have found it. Of course such a thing as that would be ridiculous in a city. It is much more difficult to get at the personal property of any other profession than it is that of a farmer. That is, I mean a typical farmer. Of course some individual farmers possess large capital in the banks or other businesses, but that is aside from their farm work. I mean the typical average farm property is all open to the assessors, who can see it if they want to.

Q. Are merchants required to itemize their boots and shoes and clothes?—A. I believe in Illinois at the present time a man is required to itemize everything he possesses.

Q. Is that the new law?—A. I could not say as to what is the obligation of merchants on that.

Q. In most States I understand merchants are just required to say so much merchandise; they do not itemize it?—A. Yes.

Q. Just estimate in a lump; not itemize as a farmer does, so many cows, plows, harrows, and sewing machines; everything must be itemized?—A. So many calves, cows, horses, hogs, etc.

Q. Just so much capital?—A. Yes.

Q. Have you anything to suggest in the way of improving our system of taxation?—A. I can not, because I have not made it a study sufficient to have any suggestion that would be valuable.

Q. The decline in prices of agricultural products—what have you to say in regard to that, relative to the present condition of agriculture?—A. There has never been in the history of the world the opening up suddenly of anything like such an agricultural tract as this great West, and covering it almost instantly with rapid transportation. The farming of the Mississippi Valley and of the Northwest and of the Far West for the last 30 years or so has been eminently destructive to fertility; it has been a case of getting maximum crops from virgin soil regardless of the consequence, and it has been at a time when we have had exceedingly good machinery to assist us; much of it would have been impossible without the finest kind of agricultural machinery, reapers, mowers, and all that sort of thing; it has been very hard for foreign people to compete against us. An intelligent Englishman said to me that if they had either one of two of our American advantages the English farmer could take care of himself. One of them was the native fertility, that we have not yet exhausted, that we draw upon recklessly without feeling that we must restore it; and the other was our Indian corn—a gross crop, which is raised cheaply, most of which comes from the atmosphere and does not draw very strongly from the land. The two things together combine to favor the American farmer and to crowd the farmers of the rest of the world very hard. This has also crowded our own Eastern farmers to the wall, and made them unable to compete against the products of this great prairie country, requiring almost no capital to develop it, almost none at all, and requiring simply some labor and some machinery. We have thrown upon the markets of the world an immense output of food products raised at a minimum cost. Of course it can not continue; it is going to cost more to produce these things in the future than it has cost in the immediate past. It

seems to me there has been no greater decline in prices than would be fully covered by our improved and cheapened system of production. It costs less to produce a bushel of corn or a bushel of wheat than it once did. For example, I own a farm in Michigan; my father and I are in company, and I own another beside of it, and he has operated it. The last time I was home we were using an 8-foot-cut mowing machine. I used to drive a 4-foot-cut mowing machine on the same farm. We are not only reducing the cost of mowing by more than half, but we are also making the lifetime of the machine double what it would have been before, because it is no harder on the machine to cut 8 feet of grass than 4. It shows the way in which the cost of production is cheapened. The old-fashioned hayrake, a great improvement over the hand rake, greatly lessened the cost of making hay. It dumps it in continuous windrows behind the machine, and the hay could not be handled until it was all raked. Now we have a rake that delivers the hay in a continuous stream at the side, and you can follow immediately with a hay loader; 3 minutes after the rake has started you can follow with the loader behind. In other words, one operation does not have to wait until another is finished, but the two go right along together; and we have vastly reduced the cost of producing the hay crop. The same is largely true with the other crops.

Q. So you think it would not be fair to compare the price to-day with the prices of former times?—A. No; not at all. We used to cultivate Indian corn with a double shovel plow, and take one side of the row at one time and come back on the other; never could get back in the middle to kill the weeds. Now a good deal of the cultivation of Indian corn is being done with the Breed weeder, which is simply a series of wires, somewhat slanting, hauled by 1 horse, guided by 1 man, and it takes 3 spaces at a time—finishes 8 rows at a time, and does it better.

Q. That is the first time or two?—A. The first time it goes right between the hills and cleans the weeds from the hills; not only cultivates corn 4 times as fast as we used to, but actually cultivates it better for that time. It replaces several cultivations by the old method. Of course this all cheapens it.

Q. How about what the farmer has to buy, as a rule, such as the necessities of life on the farm, compared with former times?—A. Of course they rise and fall. There was a time when things were lower. Some things are higher now than they were 2 years ago. Sugar costs a little more now than it did a few years ago, but the same principles, speaking generally, I think, have operated in all lines of production to cheapen them.

Q. Within 2 or 3 years a farmer has shown me a suit of clothes, nicely made up and pressed, and so on, which looked respectable and made him look like a gentleman, that he paid \$3.50 for.—A. Yes. We are getting now more matches for 15 cents than we used to get for a dollar, and better ones, too. It seems to me that, broadly speaking, farm products have followed the development of most manufactured products in this country in being produced cheaper as the result of better machinery and better methods, and that in that same sense I think they have all gone down together.

Q. So, if you were to draw a comparison, in your judgment, what would you say was the condition of the farmer as compared with a few years ago?—A. I should say his condition is better than I have known it; he has been growing up.

Q. Were you brought up on a farm yourself?—A. Yes; I have always lived on a farm. I should say it is better, and steadily growing better every year, as I have known it in this country, remembering the fact that there are always rises and falls, waves and tides. There are years where they seem to go backward in their affairs. These things are not constant; there are rises and falls, but the general tendency has been upward, I should say, all the time. Now, there is another feature of it all. In all of this time I think that the labor of the farm has at least stood constant. We are paying as much money for labor now as we ever did per month, but the purchasing power of that money that we pay is vastly greater than it was 20 years or 25 years ago for everything but land. That is a feature that ought to be considered.

Q. That is, considering the wages of people employed on the farm?—A. Yes; that is considering the wages of the people employed.

Q. Is he not receiving really more in dollars than he received before?—A. Yes; so much more that it is a principle among farmers that when they can do a thing with a machine they do it because it is cheaper; and that has enabled us to intensify our farming, to do more. But when we consider the history of this man and that one and the other, we find they employ about as many men as they ever did, but they do more things.

Q. What have you to say in regard to the organization of agriculturists; what is the inception of this movement, the cause of it, and what the ends to be gained by it?—A. I believe that the original idea resulting in the organization of farmers

was the need of protection. There was a wave of sentiment that went over the country a number of years ago to the effect that everything must be organized in order to take care of itself. Everything did organize, and the farmers felt, from some cause or other, a good many years ago that their chief grievance was in the prices they paid for their purchases, and in the fact that their prices for their commodities were being manipulated. There was a strong feeling of objection to the middleman both ways. As they said, the middleman neither produces nor consumes. He simply acts as a transfer agent, and stands between the two legitimate ends of this business, and it is a good thing to be rid of him.

Q. (By Mr. CONGER.) Does that sentiment exist to-day?—A. I do not think it does to anything like the same extent. The grange was organized in many sections, and propagated with that idea principally in mind. The result was accompanied with grange stores, and attempting to buy and sell through the medium of this organization.

Q. There seems at present to be a sentiment among manufacturers that brings about organization to a great extent?—A. Yes.

Q. Does that exist among the farmers now?—A. Yes; but for a different purpose. I do not think the farmers now feel this prejudice; certainly not against the middleman, who is a seller to them, that they did 20 years ago. The large merchants have sought out the farmer. They have sent traveling men to him. They have dealt a good deal directly with the farmers, and the farmers have learned by experience that their own local dealers can order goods for them, and will do it, too, when their order is a large cash order, at rates considerably below the retail price; and they do come in direct relations with the manufacturers; so that they find the gap is not so wide as they once thought between the farmer and the man at the other end, and that this middleman will stand between them to the advantage of the farmer if he will make it to his advantage to do so. So I think that prejudice has gone out very largely, and I think, too, that the large dealers realize more than they at one time did the advantage which comes to them from dealing directly with the farmers for cash, even though they deal through this local man, who is a kind of a transfer agent between them. It operates in the farmer paying cash more than he used to, and buying in larger orders, in larger quantities. But I do think the feeling still is held among many farmers that when it comes to the selling of his commodities there is a middle transaction that is not to his advantage.

Q. (By Senator KYLE.) Too many middlemen?—A. Too many middlemen.

Q. He does not object to 1 or 2?—A. No.

Q. He objects to 4 or 5?—A. He can see it is a long story from the time his wheat is cut until it gets into Europe or into flour. He sees, too, that wheat at 60 cents a bushel is hardly compatible with bread at 5 cents a loaf and bran at \$15 a ton, and he sees there is a good deal of money that has appeared in this thing after it left his hands. It is a little bit of the same feeling that always existed toward the middleman, both who sold to him and who bought from him, but by no means so intense. It is not a blind hatred, but it is a disposition to try to find out, if possible, what the facts are, and whether there is any such thing influencing prices in standard goods through speculation.

Q. (By Mr. CONGER.) As a general rule, the farmer thinks much better of the middleman who sells to him than he did in the years gone by?—A. Oh, certainly. As a rule, the company stores were not successful, and that proved a good many things; and then the farmers learned what retail rates were; they learned margins that they never knew anything about. There was a time before that when the merchant felt bound not to reveal the secret of his percentage of profits to his customers; but in all this the farmer has found that an advance of 25 per cent on dry goods, for example, is not very big pay; so that the object of organizations of farmers now is primarily to study their business.

Q. (By Senator KYLE.) That is they see that all other business lines are organized, not in opposition to the farmers, but for their own interests?—A. Yes; and they do the same thing: organize to study the business. Of course, in a far-reaching sense that organization is political, but only in a secondary sense. The organization now among farmers is the farmers' institute. The topics they discuss are mainly the principles involved in their business; in fact, political and religious subjects are barred. A man can not make a political speech at a farmers' institute in any State that I know of. It would not be allowed. So that men of all shades of political belief meet there and discuss these subjects. There is another class of organizations among farmers that is very helpful. There is a strong tendency for farmers interested in the same line of agriculture primarily to effect organizations. There are a great many live-stock breeders' associations; there are a great many bee-keepers' associations, dairymen's associations, and horticultural societies, in which those primarily interested in the same thing meet and discuss

those affairs and talk about business. And then, of course, there are still other farmers' organizations built upon the original idea which perhaps gave birth to the grange, but which is broader, not so distinct, not so well-defined yet, which aims to consider farming as a business as compared with other business; there are some of them. It is economic in its thought. There is getting to be a much stronger desire on the part of farmers to study economic questions for their own sake, which could not be studied at farmers' institutes; would not be allowed.

Q. If they do not study them, who will?—A. That is it; who will? I do not think farmers think now that they are considered the legitimate prey of everybody, but they do feel that there are problems that will not be studied unless they study them. But they are disposed to do it in a straightforward way and discuss their matters along with other matters, and they feel that all the affairs of this country are so interlocked one with another that none of them can stand alone.

Q. Their study of these questions has been fruitful in securing good legislation in the State legislatures and National Congress, has it not?—A. Yes; eminently so. Take this National Pure-Food Congress and these national gatherings of farmers; they aim to discuss questions which are broad and which involve their economic relations with other people and other industries. It is devoid of bitterness, as was once exhibited, and it seems to me it is remarkably encouraging in the breadth of view in which these questions are considered.

Q. The farmers of the country are very much interested at the present time in the extension of foreign markets. What have you to say in regard to that question?—A. I think it is one of the greatest questions before us as American producers, and one that ought to be studied from its own standpoint. I have found, when I was out of the country, in South America, that that country is being supplied by European people. Nearly all its trade was with Europe, and I tried to learn why. In the last analysis it was apparently for two reasons: European nations had the shipping facilities, and they had made a study of the export trade. They had learned the lesson long ago that we Americans need to learn, that the prejudices, the tastes, often foolish, of the buyers must be consulted as well as their real needs. For example, I found that the English people were putting cloth into the South American countries 1 meter wide; that they would make it any width that the people wanted if they would only buy it. The American is a little inclined to say, "My cloth is a yard wide, and you will have to buy yard-wide cloth." I found that European peoples will cater to any notion if they can only make a sale. I believe we ought to study that in agricultural affairs as well as in other things, and develop an export trade of American products; but there is a feature of it, which is prominently before us now, which it seems to me especially needs study. A great many farmers in this great Mississippi Valley are producers of gross crops primarily, like corn and oats, crops somewhat easily raised in short rotation, and their principal question is how to get that into money; and while I would not say a thing against an attempt to stimulate a European demand for American corn, at the same time it seems to me that it is a good example in hand, and it is vastly better to export that corn in the shape of beef or pork or mutton, or some of these semimanufactured products, in which you condense 7 or 8 or 9 or 10 pounds into 1.

Q. Do you think the European nations will not take kindly to corn as a food product?—A. Well, I doubt it. Corn is a cheap grain, and their cheap grain is rye. They can not produce the corn. There is no danger of their ever producing corn extensively in Europe. They can not do it in northern Europe; but they can produce rye, and all the peasantry of northern Europe is accustomed to eating rye. Then, again, corn is exported in comparatively large quantities for cattle food and pig food in western Europe. So far as I have ever been able to discover, it is not customary in any country to use for human consumption the same grain that is fed to animals unless it is raised in that country. It is a peculiar prejudice, but I believe it exists, and, like all prejudices, can not be reasoned with.

Q. (By Mr. CONGER.) Would it not be an advantage to the land of this country in having the corn fed here?—A. Decidedly. Broadly speaking, in the last analysis, we ought not to export our grain. We should be developing a thing which some time we would need to retire from. Undoubtedly we could stand a heavy exportation of grain out of the Mississippi Valley for a number of years. It is a principle in agriculture or in soils that are very fertile that if they are once broken up and put under the plow and cultivated, and certain internal processes, whatever they are—not yet well understood—set to work, a great deal of fertility is going to be liberated and go off somewhere. They may as well go into a crop as go into the river. It will go into one place or the other. There is no way, in other words, of holding indefinitely all the fertility which may be in some of these richest lands. Putting it in another way, if the virgin soil is extremely fertile,

it must reduce itself under agricultural operations; there is no way to prevent it down to a certain point, whatever that may be. Then we must begin a method of holding that fertility where it is or else we shall suffer from it. So I say we might stand a heavy exportation of grain out of the better lands for a little while yet, but they are beginning to fail in almost all sections where they have been under the plow for years. After 15 or 20 years up to 30 or 40, on the very best land, you have reached the point where you ought to consider the question of fertility.

Q. Do these South American countries import food products to any great extent from Europe?—A. They import certain products extensively; butter, for example. They import hams from America; codfish from Newfoundland. I saw in cities along the Amazon more codfish than I ever saw in this country, 10 times over, although the Amazon River is the richest river for fish in the world.

Q. You spoke of Europe catering to their wants, and your illustration was of a manufactured product, cotton cloth, and I was wondering if that applied to agricultural products?—A. Oh, our people do the same thing in agricultural tools, and I think we need to imitate the whole matter in all our foreign products. In the class of meat that we prepare for the export trade I think we ought to have in mind that there is a people that likes fat meat; let us make it for them; if this other people want a certain kind of beef, certain cuts—

Q. (By Senator KYLE.) (Interrupting.) Canned roast beef, for instance?—A. Yes; canned roast beef—give it to them. If this people want heavy hams in their beefs, give it to them. We can do it.

Q. (By Mr. CONGER.) You say the American manufacturer of farm implements caters to that South American trade and makes machines that they want?—A. Yes.

Q. Is that of recent date, or have they been doing it for some time?—A. Doing it for some time; they make things especially for them.

Q. They want their reapers and mowers built on different lines?—A. Oh, yes. Some of the general designs can not be used in those countries. The laborers are not able to operate them. The machinery must be comparatively simple in most of those countries.

Q. Their farm labor there is not so intelligent as ours, at least in a mechanical way?—A. Nothing like it; it is not anywhere in the world.

Q. (By Mr. A. L. HARRIS.) What would you suggest as the best means of increasing our foreign trade?—A. I think that the method Secretary Wilson is employing now regarding butter in the test exportations for London and other markets is the place to begin. We do not yet know, as we have not made a study of the appetite of these foreign people, what their real wants are. The only way to find out is to try to see what they want and see in what shape our products can go most successfully to their markets; make a close study of their habits of eating, their habits of consuming all these products that we can produce, and meet these habits just as nearly as possible. But few farmers realize, and a great many tradesmen do not, that you can not afford to quarrel with a man's habits of life. There is a reason for those habits; they were probably inborn; they are certainly inbred, and it pays to meet them. There is no use, in other words, of trying to get a man to eat fat meat when he wants lean; it does not pay to argue with him about it. Make it as he wants it and sell it to him, and the possibilities in that direction are yet immense. As an illustration, I might mention the fact that farmers are only beginning to realize the wonderful difference in their animals—what we can produce in the way of an animal if we undertake to do it. We are meeting European horse trade now. The whole method of breeding horses has been changed within the last 4 or 5 years, simply under the pressure of the Chicago market, principally through the efforts of Mr. Berry to meet and cater to the demand of European horse buyers and our own as well. But we recognize general classes of horses that are called for in the market, and men are now systematically breeding them. There is a little attempt now to produce the bacon hog, if we know what that is, and it is the beginning of what ought to be developed, namely, the recognizing that there are classes of products, and that a man must go out deliberately to produce the right thing and do it every time or nearly every time. If he wants to raise an 1,800-pound horse he must not raise a 1,400-pound horse, but do it every time he tries, or nearly every time, and put it into the class where it is called for, and not go indiscriminately to raising horses at random, hoping that some will be in one class, some in another, and some in another. He has too much rubbish on his hands that nobody wants. We have had a sad lesson in the indiscriminate use of trotting blood on horses of all descriptions in this country. We thought it was a good thing, and therefore we would use it, breed it, and we have bred that natural instinct of self-will and ambition that goes with racing horses, must go with them; we have bred it into a whole

lot of horses, some of them phlegmatic by long breeding, and it amounts to ordinary crossness or foolishness with lots of horses, and they are as horsemen say, unclassed; they belong nowhere; nobody wants them. This country was full of that class of horses 4 or 5 years ago, when the horse market went to pieces.

Q. At the same time there has been a good market for heavy draft horses?—A. Yes. Now these animals are more flexible than even farmers realize, and they can be modified by breeding more than most people realize probably. Another point is hardly in this connection, but still it comes up to my mind, and that is that there is an inherent difference between animals that look alike that would be said by a fairly good judge to be equal for beef production or butter production. The inherent difference between those 2 animals is often found by direct experiment to be as great as 40 per cent, in what they can do with 100 pounds of food and what they can make out of them in the shape of some desired product. If a man wants to make butter, he ought to make butter and not beef; he ought to have something that would make butter, and not produce a whole lot of beef, which is not valuable beef, and vice versa.

Q. And it is your opinion that the leaks to the farmer are along many of these lines?—A. Yes; they are. If a man attempts to do a particular thing in order to meet a particular desire and he fails of that and gets something else, he may not realize out of this something else enough to pay the cost of producing, because nobody may want it. As my friend, M. W. Dunham, the great Percheron horse breeder, used to say in my class, "Now, boys, if you try a thing 10 times you must succeed 8 or 9 times or else you will fail." And that is what the farmers are beginning to study more closely than they have before, and in the last 3 or 4 years have learned that it will not do merely to go on raising horses and cattle and hogs as such, and not to look further into it; and I think this thing ought to be stimulated, and ought to be encouraged, for it all ends in the more careful use of pure-bred sires in our farm-bred stock.

Q. That same rule would apply here to the increase of the export trade?—A. Yes, and not only the efficiency of it but the certainty. The importer and consumer of imported goods is a scary creature. He wants them alike all the time. For example, when I was in the South, I used Danish butter, put up in Italy in red tin boxes with a certain brand on them, and although I paid dearly for it I never found but 1 box of bad butter, and that was immediately taken back and exchanged—a box of about 2 or 3 pounds of butter. It made no difference what other brands the dealer had that were good, I always took that one brand; I had no desire to change. The user of imported goods is using a thing the history of which he knows nothing. He can not go into the merits of its production nor the methods of its production, and he does not have any patience if a dealer, who also knows nothing about it, attempts to explain to him that this is just as good as that; he has tried the other. Now, I think that agricultural people ought to settle quickly into a disposition to produce definite things for the export trade, and see to it that they are always of one grade, and of course the dealer will have to help.

Q. That brings us very close to the important question of the national pure-food law, inspection law. What have you to say on that?—A. If I may say another word: I said that the dealer must help the farmer. The farmer can not meet this export demand. He does not know what it is, and every man who deals in these products all along the line must help him and be connected with him, and in that way he is going to feel that these interests must be friendly.

Upon the pure-food law I have not very much that is valuable, perhaps nothing. It is a subject upon which the farmers feel strongly, but perhaps no more strongly than other people. They feel this, that one of the objections to adulterated food is that they tend to unsettle trade values and to unsettle confidence on the part of the buyer.

Q. Where did you buy the Danish butter?—A. I bought that in South America.

Q. Why did you buy it?—A. Because it was good butter and always the same thing.

Q. Something in which you had confidence?—A. Yes. It was most commonly offered by the best dealers. You go to the stores here in Chicago, any of our great stores that have these goods, and they would say to you, "These goods are from the same firm"—perhaps on this side of the water and perhaps on the other side—these guarantee all these goods."

Q. Do South American buyers have any dealings in American products?—A. They do in certain lines; they do in Armour's hams. I know I bought a little ham no bigger than my two fists, and paid \$3 or \$4 for it, but I considered that I got my money's worth, considering the circumstances. Now, the farmer feels that way about the adulteration of foods. Of course he feels it as a consumer, but he also

feels it as a producer of food materials. He feels that adulteration, even though it may be with materials that he himself produces, is bad for the farmer. For example, flour; he feels that if corn meal in any form is put into wheat flour, and the whole sold as wheat flour, that it does him damage. Now, in this case both ingredients are produced upon his farm, and we might suppose that the farmer would be entirely indifferent as to whether they were mixed or not, but he knows that that flour can not extend the export trade, because it is an uncertain thing. He is interested in having certain brands of flour become standard and known the world over, not only abroad but here in our own country, thus stimulating the use of the flour. He is interested in bran being kept as bran, so that people will know what it is. Now, we buy one load of bran at \$15 a ton, and it is good wheat bran; we know it is wheat, and that is a good deal, and we know what we can do with that bran, what to feed on it, and how much milk it will produce and how much butter. The next load of bran we get comes from the same dealer, and has a large percentage of corn bran in it, nothing to feed, nothing but hulls in it, feeding value next to nothing, and probably it has not paid the cost of transportation from the city where it was produced down to the consumer, and it unsettles his confidence in bran, and tends to prevent his using it, too. So that the farmer feels that the general business of adulteration is antagonistic to settled values and the free and open use of products on the part of the people of the world, and of course he is interested in their securing all that they can of these things, and in stimulating confidence on the part of the buyer. We have in Illinois a pure-food association composed largely of farmers, and the principle they advocate is that everything shall be sold for what it is; that it should be labeled. If a man desires flour 4 parts wheat and 1 part corn meal, why he ought not to be prevented from buying it, but it ought not to come into the markets in cowardly competition with straight wheat flour that has a character to maintain.

Q. You are in favor, then, of national legislation along this line—pure-food laws?—A. I am, decidedly. It is naturally impossible for State legislation to control that, because the moment one State moves all the manufacturers will satisfy that law the best they can, and they will dump their other products into the neighboring State that has no food laws, and the temptation is to get just as close to the line as they dare.

Q. And the law has no application ultimately to their manufactured articles, as that is a subject of interstate commerce?—A. Yes; it seems to me that, both for home protection and for the protection of our export trade, we sorely need national legislation that shall at least provide that the brand on a thing shall be a true index of what it is, and I think the farmers are coming to feel pretty strongly that we must protect our trade-marks.

Q. I would like you to give something about the operation of Federal and State laws to prevent the spread of disease among domestic animals?—A. There is very little I can say. I marked it more for the sake of saying—without having any expert knowledge on the matter, because it is out of my line—that the aim and intent of those laws, it seems to me, are eminently wise; that we must protect the health of our animals, both for the good of the individual, of the live-stock interests here at home, and for the sake of meeting the foreign dealer who, of course, will neglect no opportunity to see an objection to our meat or milk supply.

Q. Both these questions are very intimately connected with our export trade?—A. Yes; I think so, and the ability to guarantee quality and protect any trademark, or any device, or any shape in which goods are offered and create confidence on the part of the buyer at the other end. Exported goods are very largely luxuries, even though they may be necessities of life, and some man can get something which will take the place of them in his own country cheaper; so that in all these products, in our dealings with the class of men who are able to pay a little extra for a good thing, and who are willing to do it, they are naturally at liberty at any time to discontinue buying if they have been deceived. And that is what I wanted to say on this matter. I do not think we can be too strict in our laws to prevent the spread of disease. Of course I may say that I think we are liable to go to extremes sometimes in attempting to put these laws in force. That must necessarily follow. Take tuberculosis. Personally, I do not believe it is such a dangerously contagious disease as some would say.

Q. Did it exist in former times, in your judgment, as much as it does now, or have we just discovered it?—A. In the world, I think it did. Of course the thicker our population gets and the more animal population we have the more we will have of it relatively. There is more disease here now than there was when the country was new, excepting cholera. A new country, of course, is not possessed of the germs of these animals or human diseases, either one, but as people and animals come in these diseases get a foothold, and they live and mingle; and this is a thing which we must be constantly on guard to relieve.

Q. (By Mr. CONGER.) Has the State of Illinois made any efforts to foster good roads or to promote their construction?—A. I am not able to say. I have an impression that there is on the statute books a provision by which localities may begin the construction of roads. I have not made a study of that, and I can not say.

Q. (By Senator KYLE.) Was there not a bill before the legislature here?—A. Yes, it has been very much discussed, very much talked about. As the question stands in the plan of inquiry, it is "The effect on the cost of local transportation." Now, there is a good deal of wrong figuring done about that. A man figures how much it will cost to haul a ton to market on good roads, and how much it will cost to haul it to market on bad roads; and he takes the difference and multiplies by the number of tons hauled, and computes that he could well afford to pay for good roads. The objection to that method of figuring is this, that the farmer is not obliged in practice to haul that number of tons to market on bad roads, and he does not do it. In other words, in any agricultural country that is producing crops extensively, through a large share of the year the roads are comparatively good. Through Illinois it is entirely possible to put heavy loads over our roads in a good share of the season, and there is an immense amount of unconsumed horse labor on our farms. And I think there is great danger of magnifying the financial necessity for good roads. There are many other arguments for good roads which are convincing: their convenience, their uplifting influence on the community, their advantage in making country life happier, and all that sort of thing. Those arguments can not be overdone; but upon the pure financial return to the farmer in marketing his crops, there has been a great deal of wild talk.

Q. (By Mr. A. L. HARRIS.) Do the good roads come always when the prices are higher?—A. Oh, no. Still an assistant of mine once made a study—this was some years ago—of the best time to market wheat. That was in Michigan. He studied the subject for the previous 20 years before, and he found that considering the interest on the value of the wheat and rottage, damage by rats, and the loss which the farmer would suffer by storing his grain in his granary for two or three months, there were only 2 or 3 years in the 20 in which he would have got more money for his wheat than he would have if he had sold the day he thrashed.

Q. Is there not a feeling among the farmers that prices are depressed?—A. Yes; there is such a feeling. Of course he does not study the market reports of other seasons so much.

Q. Do you know whether or not that is overcome to some extent now by the immense amount of wheat stored in great centers like Chicago, that can be dumped on the market?—A. I have no information upon that worth anything. Of course there is an impression that it has an influence upon the market, but I have no definite information.

Q. You never made that question a study?—A. I never made that question a study.

CHICAGO, ILL., August 12, 1899.

TESTIMONY OF MR. JOHN C. HANLEY,

General Business Agent for the National Farmers' Alliance and Industrial Union, and the National Grain Growers' Association.

At a meeting of the subcommission on agriculture in Chicago, Ill., at 2.40 p. m., August 12, 1899, Mr. A. L. Harris presiding, Mr. John C. Hanley was introduced as a witness, and being first duly sworn, testified as follows:

Q. (By Mr. CONGER.) Please state your name and residence.—A. John C. Hanley; St. Paul, Minn.

Q. And your present business or occupation.—A. I am general business agent for the National Farmers' Alliance and Industrial Union, and the National Grain Growers' Association.

Q. Have you any statement that you want to make?—A. I was going to state that aside from the matters you have assigned me in your plan of inquiry there are several items which I deem of sufficient importance that I should cover that are not incorporated in your list of questions, among which are the conditions of farming in general in the country, the low price of farm products, and to my mind a remedy for these conditions. I have prepared my statement in writing covering those particular subjects. Briefly it presents a state of facts showing

that farming, as conducted under the present conditions, meaning all the conditions attendant upon farming, that farming, as a business, is conducted at an absolute loss, as we can show by actual farmers engaged in that line of business, representing every section of the country—the natural conditions, from the intelligent farmers, poor and wealthy, and every shade of political opinion and every shade of nationality, showing all along the line that farming, as actually practiced, actually conducted on the farms of the people, is so conducted that unless the most rigid economy is practiced the farmer will soon lose his farm.

Q. What is your opinion of the comparative condition of farmers now and 10 or 20 years ago?—A. Well, that is a pretty large subject. I was raised on a farm, where my uncle, whom I lived with, preempted his claim, and he was only 12 miles from St. Paul. I was raised until I was 16 years of age on that farm, and experienced the early conditions of those people, digging out the grubs and stumps, the slow processes of farming which they had in those days, and the privations which they endured, something that I do not believe would be done under those conditions by our people of the present time, unless it would be by a class of people accustomed to greater hardship. I remember in those days that we lived as our neighbors did; we each lived as well as the other; we were content in those days to live on sour milk and potatoes; we got along well, we thought. My uncle is running that same farm to-day, and he is probably worth \$35,000 to \$40,000. His land has increased in value, but it is not due to the fertility of the soil; it is not due to the income that is derived from the soil.

Q. What is it derived from?—A. It is due to being adjacent to a commercial community that brought values up; it is on account of the building up around and about. I might say, in that breath, that all those farmers through that section of the country to-day are wealthy; probably none of them is worth less than \$20,000. I recollect one old fellow that we looked upon as a sort of a target for all boyish pranks in those days, an erratic old man, foreigner, a German, raising watermelons on a little side hill; we used to go and steal the watermelons, and all that sort of thing; he was the target for all the pranks of the neighbors for miles and miles. He plowed away in his unsophisticated manner, and to-day that man is worth more than any of those people around there. He has acquired property all around him from those who did not like farming. Farming became onerous and they departed, and he took up their land; and to-day that same man that was, you may say, a despised individual in that community in those days, is really one of the most prosperous individuals in that whole community.

Q. What section of the country or State are you talking about?—A. Minnesota, at a point within 30 miles from St. Paul. They come to St. Paul with their grain, of course. In that country they have the benefit of a terminal market.

Q. How long since you have had practical experience in farming, yourself?—A. Not since that time.

Q. How long ago was it?—A. I was 16 years old when I left the farm; that is about 24 years since I was an actual farmer.

Q. Was there much improved machinery in use on the farm in those days?—A. No, we used to do then with a cradle and with a sickle.

Q. Has machinery improved the condition of farm labor?—A. Oh, yes; very much, very materially.

Q. So that the drudgery of farm labor is not as great as it was in the earlier farming?—A. Not what you might call the actual drudgery. There is not so much drudgery attached to it as there was in those early days.

Q. Causes of irregular employment—what have you to say on that subject?—A. The cause of irregularity of employment is due often to those waves of prosperity and adversity, as you might call them, that sweep over the country at times, often brought about by the rapid and more expensive rate of living, people living beyond the measure of their income.

Q. On the part of the farmers or other people?—A. Upon the part of people in general.

Q. Including the farmer?—A. Including the farmer. Often these are due not to individuals at all, but as a general proposition. These waves of prosperity and adversity follow each other successively, about every so often, from general causes.

Q. You think when a period of industrial depression comes upon the country that there is less regularity of employment on the farm?—A. Yes, there is. Under those conditions the farmer who ordinarily would employ help either performs a greater portion of it by himself or his family; tries to get along with less help to make up for his restricted income, which he is not enabled to pay out in the shape of farm labor.

Q. Do you know of any other causes for irregularity of employment than industrial depression?—A. No.

Q. Do the farmers of Minnesota employ as many laborers in winter as in summer?—A. No; but as to that there are only certain seasons of the year that farmers work to any great extent with outside labor, outside of probably the large farms, bonanza farms, and things of that kind. The winter work practically eliminates the necessity of hired labor—that is, upon the average general farm, it is only in the summer months during the busy season. For instance, at this time now, in Minnesota and in the Dakotas, we have the greatest difficulty in getting sufficient farm laborers to go out into the wheat fields to save the crop. They are paying all the way from \$2 to \$3 a day to secure men, and they can not get enough to-day. There is another attraction also to divert them from the farms, and that is the great amount of railroad building that is going on this year in the Northwest.

Q. Do those contractors on the railroads pay as high wages as the farmers offer?—A. No; but it is regular work—that is to say, regular hours. The hours are not so long as on a farm, and there are other attractions. They know that the railroad work will last considerably longer than work on the farm, and they are a little more reluctant to accept the farm work in preference to the railroad work.

Q. How many hours of employment do the farmers want or desire for the \$2.50 and \$3 you say they are offering?—A. Different farms have different hours.

Q. What would be the average?—A. I presume from sunrise to sunset would be about the average. On the farm where we worked we worked longer than that, got up earlier and went to bed later.

Q. You say from sunrise to sunset would be the average hours now in Minnesota?—A. I think so, especially in harvest and threshing time.

Q. Do some of them work even longer than that?—A. Yes, they work until the moon rises.

Q. Does that condition exist generally in that country among the farmers?—A. Yes; in that section it does. The idea is this, the season is short and cold weather sets in, and every hour counts from the time that the grain is ripe until it is in the elevators and in the granaries. Every hour is valuable, and the amount of waste time, rainy weather or anything else in there, goes to take up that time; they have to put it in in order to get out whole.

Q. What hours do the farmers of Minnesota require of their hands at other seasons of the year than at harvest?—A. They are very reasonable after the rush of the season is over—the condition of farm labor. They are admitted to the family upon the same plane of equality, eat at the same table, partake of the same social conditions, practically, that a member of the family would, and the hours, I presume, are from 7 o'clock until 6 o'clock, and in the later months of the year even those days are long on the farm, because it gets dark early.

Q. Nine or ten hours of actual labor?—A. After the season, the rush of work is over. When there is a crowd around, everybody works late at night to finish up; they want to get through.

Q. Is there a tendency among agriculturists of your section of the country to seek other employment?—A. Yes.

Q. For what reason, or is that covered in your paper?—A. I covered that pretty fully, that particular feature of it. I will say that it is generally on account of the isolation, the lack of social enjoyment and intercourse, the yearning for the society of others, for excitement, for amusement, as compared with the drudgery and monotony of farm life. I show in my paper here where a very large per cent of the inmates of the insane asylums of the country are from farmers' wives and daughters, due to the result of monotony and irksomeness and the lack of social intercourse with others, long dreary winters and all that sort of thing, which go to drag down the systems of those less rugged than their neighbors, and due also from the education which the young men and the young women of to-day get. Their education is of such a character that it creates an ambition in their hearts to rise above their conditions. They see that they have been drudging along on the farm at hard laborious work, with little prospect of ever achieving any great results except the natural growth of the valuation to the land. The income from the land itself can scarcely keep up decent appearances and pay the interest, probably, upon the mortgage, taxes, and other fixed charges. They find very little hope of ever realizing any great amount of income from that source, and they seek other avenues of occupation which they hope will bring them better returns at less sacrifice than they endure as the result of farm life.

Q. Can you suggest any remedy for these evils?—A. Yes; I believe that if farming can be made profitable the condition of the farmer will be reversed. He will have in his house much of the necessities of life and some of the comforts. He will possibly have his children educated to some of the accomplishments, to music, have some books in his house, a library, papers, magazines, all the other attendant paraphernalia that goes to make home life pleasant and comfortable.

Q. Do you not think that quite a large proportion of the farmers, in the older States particularly, have those things you have enumerated now?—A. Possibly they have, but a great many have not. Most of those who have, unfortunately, are leaving the farms to tenants and going into the cities to secure the enjoyment of that which their means can secure for them in the shape of associations and all those attendant conditions.

Q. And you would take it then that if a farmer is able to get some of these luxuries of life, it makes him want to go to the city?—A. No; not particularly. I say that where he is without them, and as farming as a business proposition is not a profitable enterprise; he naturally directs his attention to somewhere else, some other mode of living, especially among the younger members of the family. They are not contented to stay upon the farm and drudge away without any reasonable prospect of ever getting any further up. As I said before, the education of the young man, which is much better than it was in the earlier days, has educated him to have the ambition to rise above his neighbors or his present condition, and when he sees no prospect for achieving that condition in life on the farm he naturally turns to the city and to other occupations, thus making farming unprofitable and unpopular.

Q. When I asked you for a remedy, you said if farming could be made profitable, why so and so would occur. How would you make it profitable?—A. By getting him a market for his goods, and not compel him to raise his goods at cost and less than cost.

Q. How would you get a market?—A. By getting to a place where people would consume his products; finding a country that has stomachs to fill with his products; utilize every agency, every means that can be employed to clear away every impediment and obstacle in the way of securing proper trade relations with those countries, and create a competition with those who combine together, and give him 15 and 20 cents a bushel more for his grain and 2 or 3 cents a pound more for raising his cotton.

Q. Where, in your opinion, is that opportunity for making this export market?—A. Most of the people of the world live in the Asiatic and Oriental countries. That is covered in my statement.

Q. Have you any other suggestions to offer as to remedies to improve the condition of agriculturists?—A. I have only one remedy, as I said before, and that is to make farming profitable; and there is only one way to make it profitable, and that is to get him better prices for the things he has to raise.

Q. And the way to get better prices is to give him better markets?—A. Yes; and that involves the question of American shipping.

Q. (By Senator KYLE.) That is covered in your paper?—A. Yes; I have covered both of those subjects.

Q. In general, what is your idea about the restoration of the merchant marine?—A. My idea is that it is absolutely necessary, and it is second in importance only to the foreign markets. It is necessary to have the shipping to extend those markets as a result of their own natural inclination. When we are dependent upon foreign nations to carry our goods to foreign markets, which are often in competition with their own countries' products, you can see at once we are very materially handicapped.

Q. Are we carrying our goods in foreign bottoms?—A. As far as we can get them. Lots of our products can not go because there are no foreign bottoms nor American bottoms to carry them in. Lots of the markets are waiting and open for them, but there are no bottoms of any kind for them.

Q. What is your idea in reference to restoring the American merchant marine?—A. It would be quicker to subsidize the merchant marine.

Q. That is very generally held by the farmers?—A. Yes; that has been passed by our general assembly as absolutely necessary, the National Farmers' Alliance; also the National Farmers' Congress, and ourselves. I could illustrate very clearly how important that would be. For instance, we would have facilities, vessels of, say, 10,000 tons—take 2 vessels that would leave our Western ports daily. Of course this whole question of American shipping is only applied to the Pacific Ocean trade, as the Atlantic Ocean trade is pretty well covered. But we would be at a disadvantage there in competing with foreign nations; but if we could go to work and have, say, 2 vessels of 20,000 tons capacity daily leaving our shores with agricultural and mineral products at a subsidy of, say, \$2 a ton, it would cost us \$40,000 a day; that would be paid out for shipping for 300 days in the year; that would make \$12,000,000, which could be taken from the appropriations for public buildings and river and harbor bills and scarcely missed, on account of the recklessness which very often is involved in the expenditure of these moneys. We have an illustration in St. Paul to illustrate this point in our public building. I

think there was something like \$300,000 put in in the first place, and they found that that was not enough, that they wanted more money put into it, and the only way to spend that money, according to my way of looking at it, was to run up a big tower 200 or 300 feet high, which was of no use, and to build a dam between Minneapolis and St. Paul that will never amount to three straws except to give the boys at the university a chance to pull their boats. Here are the great agricultural interests of this country left to be reduced almost to pauperism, while they are so lavish in their appropriations in other directions.

Q. Have you examined the shipping bill now before the Senate?—A. No; I have not; I have not seen it; I did not know that there was one.

Q. There is one—I expect it will be up before the next session—in the line of subsidizing.—A. I am glad to hear that. My idea is that our association will send a representative down there, possibly myself, to look after that feature of it.

Q. It is on the same line you suggested, only you have a little different idea maybe.—A. Never mind; if we can secure that it will be a guaranty that our products will get a proper share of attention. That is what we want. These countries will become our customers. That will naturally enhance the value of our productions in the United States and bring on a real era of prosperity and make the farmer prosperous. He can then employ men and pay them reasonable wages; he will not have to work so much himself; he can give his family some of the advantages of education, an opportunity to become educated rather than to be out hustling in the field. I tell you it makes a big difference between listening to theoretical farmers and going from house to house, as I am obliged to do in my capacity, and hearing what they say. Men can tell you who work for the colleges and write for the papers; you go into the farmer's house and sleep in his bed and break bread with him, and you will have a different idea.

Q. (By Mr. A. L. HARRIS.) What part of the country do you refer to?—A. I might say all over. I cover a considerable range in the course of a year. There are some—I don't say they are all that way—we have a representative of our organization who lives in a \$72,000 house and is a millionaire farmer.

Q. (By Mr. CONGER.) What is the nationality of the farmers as you have met them?—A. Well, they are of all classes. Up our way there are a great many Scandinavians among them, and a great many Germans and Irish.

Q. Do they make a good class of citizens; all industrious, hard-working people?—A. Yes.

Q. Successful farmers?—A. Practically; they work hard.

Q. Is there or not a tendency among them to colonize?—A. In the communities where they colonize I can not see that they make as rapid progress as they do where they are promiscuous.

Q. Do they not assimilate with the Americans and become good citizens as quickly?—A. Well, no; not exactly that. They are good citizens all right enough, but what I mean is, they seem to import the ideas of their own country and are slower to Americanize themselves and catch up and keep pace with their Yankee neighbors.

Q. Do they seem to desire to reserve the use of their foreign tongue and customs?—A. Yes; there are sections of the country in our society where they can not understand English.

Q. Do you think that is beneficial or otherwise?—A. No; I think it is otherwise. I think if they would fraternize and mix up with their neighbors that the exchange of different country ideas and American ideas would sharpen up their intellects and make them better and more prosperous and more adaptable.

Q. Does the tendency to preserve the use of their foreign language tend to retard the education of the coming generation?—A. I think it does.

Q. What do you know of the public-school facilities among the farmers; are they sufficient or otherwise?—A. They are pretty well, except up in the frontier countries; they are pretty well established, pretty fairly represented.

Q. Has Minnesota a good public-school system?—A. Very good, indeed.

Q. Do you think that it is tolerably well adapted to the needs of the farming community?—A. I do, so far as the public schools go. I don't think they go far enough. I have very peculiar ideas about our public schools. I believe that there is too much theory and less of real practical knowledge taught to children, but that is more so in the cities than in the country. We are not considering the cities, I suppose, in this case. There is not enough of education of any kind in the country, because it don't last long enough. It don't go far enough.

Q. What is the average school year in the country—how many months?—A. Oh, I wouldn't want to say. They have a certain number of days.

Q. (By Senator KYLE.) In that you imply that the curriculum don't extend far enough?—A. Well, the child don't study long enough to get to the end. They

don't have enough practical knowledge. In the agricultural districts my idea is that a certain amount touching on agricultural subjects should be taught with the other rudiments, arithmetic and grammar, and these other things—the nature of plants, and the stock and the animals and other things raised on the farm. Give them some idea of theoretical farming, and they would like it; give the girls some notions of sewing and baking and some of the practical and useful employments which they will be afterwards probably called upon to carry out rather than a superficial idea and the general notion that prevails, especially in the city schools, that labor is disreputable and children are better than their parents, and all that sort of thing; and they learn a little of Delsarte movements and notions, and are absolutely unqualified to take up the duties of wife or servant in the house. They must all be typewriters or something of that kind—clerks in stores.

Q. (By Mr. CONGER.) Your idea is that the curriculum of the country schools is not adapted to the needs of the scholars?—A. I don't think it is.

Q. And you would transplant from the cities some of the features of the manual-training schools, as far as the girls are concerned at least, to the country schools?—A. I would certainly teach them something practical.

Q. Have you any further suggestions to offer along the educational line?—A. Well, that is as far as I would like to go upon the subject of those small schools.

Q. Taxation—anything to offer on that?—A. Yes; that is a very fruitful and important item to the farmers.

Q. Do you think the farmers pay as much taxes as they ought to?—A. I think they pay a great deal more than they ought to as compared with other industries.

Q. Any remedy to offer for the evil?—A. I have. I believe in taxing every article of property, whether it is visible or invisible, on its full cash value, and not a percentage of it.

Q. Isn't that the theory of most present systems?—A. No; I don't think so. At least we find a difference up our way.

Q. I said theory.—A. Theory? Yes; possibly. It is supposed to be. I will give you an illustration. I appeared a year ago before our State board of equalization. There was a question of raising the taxes all around. Some of the cities imagined that they were paying too much taxes, and they went to work and cut down the valuation of the real estate so as to reduce the total valuation and reduce the State tax; and the farmers, of course, objected considerably, and I was sent before the board. And we found the merchants in the city coming up there to object to being raised, and that everybody else opposed the valuation of real estate being reduced all over the State, because it would naturally raise the rate of taxation and fall upon the farmers—naturally, too. We found among our merchants and jobbers men—leading representatives of their class—that came in there, who were rated at \$1,000,000 and who were carrying insurance of \$750,000, making a statement that \$85,000 was all that they ought to pay taxes on. It is going on now in St. Paul and Minneapolis. They said, "If you tax us you will drive us out of this State and this city." Now, I have estimated that on the different franchises and public utilities that are not on the books at all—banking, stocks, and a thousand and one other invisible and valuable securities—something over \$200,000,000 escapes taxation in our State, and what we want to do is to make these values that those people have upon the stock boards of the country a basis for taxation, and to have our register of deeds, or whoever would be the proper authority, put a stamp on these certificates of stock, showing that the tax has been paid before they will be considered a legal asset, if you will call it so—before they will be transferable, the same as taxes on property or anything would be a lien on the estate, whatever it would be—before it is transferable from one party to another. And it seems to me that we finally must get to a point where we must have Federal legislation, because for each State to undertake to do that would practically ruin that State as against another, and there must be some Federal law.

Q. Why not a State law to raise definite taxation?—A. It would drive people out of that State to other States that didn't have it. What I am getting at is that it must be a general law; it must cover every State. If any State escaped that, that would be the State to which those people would flee to do their business and escape the tax.

Q. Isn't it a fact that all direct taxes have their origin in each and every State by State authority, and that no direct taxes are now levied by national authority?—A. I think so; but what I was getting at was that there should be some general

law, some uniform law, that all the States should adopt.

Q. That might necessitate an amendment to the Constitution of the United States if Congress is to be empowered to regulate taxation for State purposes?—A. Well, I did not go far enough into the details of it; but the point I make is

that you want to put everyone on the same plane of equality, and not have one community pay about 8 per cent on their valuations and the other sections or the farmers pay 100 per cent.

Q. Your idea is that in the taxation of franchises lies the source of great revenue that is not utilized for the raising of taxes and should be?—A. Should be.

Q. You said that you had estimated that there were \$200,000,000 worth of property in Minnesota that escapes taxation. Do you know the assessed valuation of taxable property in your State as equalized by the State board?—A. Well, I could not call it offhand now.

Q. Well, approximately; do you know whether it is one or five hundred millions?—A. Oh, yes; more than that.

Q. More than which, the greater figure?—A. Yes. We raise \$3,000,000 a year taxation for State purposes. That was a matter that was discussed by our board at that time, that it was in that neighborhood, taking off these valuations from the jobbers, who, for instance, as I said, there were men carrying \$750,000 insurance and only paying taxes on \$85,000, and that represented very nearly the same ratio of all the balance of the jobbing interest.

Q. What have you to say on the subject of the decline in prices of agricultural products?—A. That really becomes a matter of supply and demand. We also have a lot of other attendant conditions, such as gambling in these products, that cuts a material figure in establishing and fixing prices.

Q. Have you anything to say on the increase of acreage under cultivation? Has that anything to do with the decline in prices?—A. I don't think so, because the bigger the acreage is the bigger the price; the acreage does not cut any figure about the price.

Q. What do you know of bonanza farming?—A. Well, bonanza farming, I would prefer to leave to those people. Those fellows have been wiped out. A cyclone passed over the Grandy farm, and practically annihilated him.

Q. By Senator KYLE.) Is there a tendency of big farms to divide up into small farms?—A. No. I think they are a detriment to the community. I believe bonanza farming is only profitable in this way: There is a condition existing among the middlemen, which probably you have had under investigation here, and which Congress has had under investigation—the subject of elevators. That grain which can be preserved intact from that section of the country which is the home of No. 1 Northern—where that can be preserved intact, as I say—and moved in bulk to export points such as Buffalo and New York, there is a premium of from 3 to 4 cents above the natural grade, which it can be given outside points on account of the superiority of the article above the grade. In that way very often much of the loss sustained by other farmers is escaped by these men because they can ship the cars direct. They avoid the combinations of local elevators, pressing down the prices 2 or 3 cents a bushel and as much as 7; they have had it as much as 7.

Q. It has been said here that if wheat of the quality which you now mention could be gotten at Liverpool unmixed it would bring 15 cents a bushel more than at present?—A. I don't know what it would be there. I know that these men get a premium of 5 cents a bushel at Buffalo. I don't know how much it would be beyond that point.

Q. Is it possible for the farmers in your organization to ship their wheat together?—A. Not yet. We are arriving at that point now. We are building a line of farmers' elevators all over the Northwest now, so that within a year or so we will be able to do that. This year I have promoted about 92 farmers' elevators, and last year we had building and in operation about 143.

Q. Is this a new movement?—A. Yes; it is the result of this agitation. It is the only way to take care of matters at the local point; it is the only way to establish competition.

Q. Is it a farmers' stock company?—A. Yes; they run their own elevators separately and distinctly for themselves, and then the organization or society stands back of them and supports them.

Q. (By Mr. A. L. HARRIS.) Do the railroads give you any facilities or any encouragement?—A. Yes. I must say they are giving us all the encouragement possible now, but it has been a hard and bitter fight to get them to that point. We have been fortunate in securing the services of Mr. Hill; he gives our houses the right of way all over his lines in the country.

Q. How about the terminus?—A. The terminus we can not handle yet. We shall have to wait until we can build our own terminals.

Q. (By Senator KYLE.) Will Mr. Hill give you terminal facilities?—A. I think he will. He has not exactly said so, but he has practically intimated a price of half a cent, which is very reasonable. It is cheaper to pay that rate than to engage in the building of elevators. He has large facilities for any amount.

Q. Half a cent what?—A. Half a cent a bushel storage charges in terminals.

Q. (By Mr. CONGER.) Which would mean keeping it separate?—A. Yes.

Q. (By Mr. A. L. HARRIS.) This is a very important subject; we would like to have you go into it as far as you can.—A. I don't know how you can get around

the question of mixing grain. Grain is sold on the markets of the world, as I understand it, upon grade; that is, for export. I am not fully posted on that subject, but my impression is that the grade which the farmer goes on, No. 1 and No. 2, is a far different grade from what is sold in Liverpool and the markets. There is a wide range between the two, and everything lies in the successful and prosperous condition of the elevator and grain-handling business. There is more money made on the grain after it leaves the farmers' hands, by the several different men through whose hands it will pass, with possibly the exception of what we will call the commission of 1 cent for disposing of it; that is the last of all, whether it is a cent or half a cent—the last of all the fixed charges and unfixed charges. The manipulation by which the grain can be converted is the source of the greatest profit of those who are engaged in the business; and if we could establish in some way a national grade, and then have our grain bought and sold at a premium or a discount according to that grade, I believe that the farmer would have some show of getting some of the profit which the value of the grain should bring him which now goes to the other fellow. I am not satisfied but what we could get a still better reduction upon freight rates. I believe that freight rates are too high, although we were fortunate enough in the Northwest to secure about a 14 per cent reduction last year voluntarily from the railroads as the result of our organization's cooperation and work with the railroad companies; or, in other words, we secured from Mr. Hill, of the Great Northern, a reduction which had to be followed by the others to meet competition. That is how we got it of the other fellows. That reduction amounted in round numbers to \$1,100,000 on the Great Northern, and with the other roads amounted in round numbers to \$3,400,000. We also secured through the cooperation of Mr. Hill, as I said before, a reduction of a cent and a half or a cent and a quarter, which all the Buffalo elevators were charging at one time. Mr. Hill started his prices at a half a cent, and set the price upon 208,000,000 bushels of grain that went through those elevators, which represented a reduction of \$1,560,000.

Q. (By Mr. CONGER.) Onelevator charges?—A. For elevator charges, which was a saving to the farmer on top of the \$3,400,000 last year. We also secured the cooperation of Mr. Hill in establishing those elevators, which has been the means of promoting such a tremendous amount of them this year and reversing the policy of the past; and with the starting of this line the other lines were obliged to get into line and do the same thing. Some of the companies there are very reluctant to allow those elevators to be built, especially where they come in competition with established conditions or land companies along the roads, and where it is not at a competitive point we sometimes have considerable difficulty in getting sites.

Q. (By Senator KYLE.) Do the farmers stand by you in the conflict?—A. Oh, yes.

Q. Between the land companies?—A. Oh, yes; we find no difficulty in that.

Q. I have heard that sometimes they will not; that when it comes to a cooperative society, they will patronize the cheapest. What have you to say on that?—A. Our policy is that the local elevator shall pay the highest price less 2 cents for operating charges. Where it goes below that price the land companies will offer say a cent above that; they will give 1 cent for hauling the grain to the land company, or keep their house closed or open whenever the conditions are equal.

Q. You said that this reduction secured in the freight and elevator charges went to the benefit of the farm. In your opinion did the consumer receive any of that benefit?—A. I think so, to the extent that it is not governed by the monopoly of the business.

Q. What I am getting at is whether the reduction in those charges brought a higher price to the producer of the grain or a lower price to the consumer of it?—A. The producer got a higher price; he got the price less the freight to market. To-day upon the stock exchange here, the board of trade, it is about 70 cents a bushel. Take it up there in our section of the country where the great bulk of our property is wheat—we have the wheat crop of the country, of the world for that matter—the average price that the farmer gets for his grain is in the neighborhood of 50 cents, notwithstanding the price generally quoted is 70 cents. That 50 cents includes all the fixed and intermediate charges, freights and handling, and everything else, which the farmer does not get. I find that grain about 150 miles from market brings about 60 cents; more than 250 miles, about 55 cents. At about 400 miles—when that grain comes over 400 miles—the price is down in the neighborhood of about 45 cents. So take the value that is at the farther end of the wheat belt and the value at the near point and average it all up and it runs in the neighborhood of 55 cents. So that it is very misleading when people talk about 0-cent wheat. The farmer does not get 70 cents for it. He practically, on an average, gets 55 cents for it at that price; and it costs to take it to New York about 25 cents,

figuring by the New York quotations, which shows that it practically costs about one-half what it costs to raise a bushel of wheat to market it, to get it to New York, to the seaboard.

The main purpose of our organization is to look after the interests of agriculture in a nonpartisan way, just like the manufacturers look after their interests. In other words, I am frank to say we are organizing a combination that is bigger than any other combination. We are organizing one trust to fight another trust. That is about as short a way as I can get it. The only way to resist them is to make a bigger one to control them.

Q. (By Mr. CONGER.) Is there much diversity of agricultural products in your section?—A. Yes; considerable. It has been found that diversified farming is absolutely necessary in a good portion of the Northwest to make up for the loss by raising a crop as a crop; that is to say, it is found more profitable to convert the crop after it is raised into stock, to dairying, dairy products, butter, things of that kind, than to market the crop as a crop.

Q. Speaking of transportation charges, have they increased or decreased during recent years?—A. They have decreased.

Q. Do you think they are lower or higher than they ought to be at the present time?—A. I think they are too high yet. Still I have no reason to complain about agricultural products, when I come to consider other articles of transportation, such as coal and lumber and things of that kind.

Q. Then the tendency is downward?—A. It has not been. I think those particular things are extremely high.

Q. Is the tendency to increase those charges?—A. No; not to increase them, but the condition is permanent—that is, it has continued to be at a point that was early established, when the country was thinly settled and business was scarce; the same rates prevail at this time that prevailed then, and I think it is an injustice. The volume of business now is probably four times as much as it was then, but the rates are just as great.

Q. You speak of having some reductions in freight charges and elevator charges by Mr. Hill and the Great Northern. Isn't the tendency in general about the country for transportation rates to be reduced?—A. No; I don't think so. This was not voluntary. The association had a bill to reduce freight rates in general 20 per cent.

Q. This is a counter movement on the part of the railways?—A. Yes; this was given in exchange for carrying that proposition out upon the whole. We were going to make a campaign matter of it and send farmers to the legislature to enact that law.

Q. Did you make that campaign?—A. No; on account of getting the reduction upon our own particular product. The others have to give that reduction, and that went into operation ahead of the legislature's meeting.

Q. Have you any good-road movement in your State?—A. Well, there is a lot of talk about making roads; it has got about so far with us.

Q. You have not had any results coming from this talk?—A. No; I don't think so. We have a lot of talk going on just now. We are going to have a big time at our State fair; that is about all it amounts to. That is most important, to make farming a pleasant occupation, to say the least.

Q. You think it is more important that way than as a financial proposition?—A. Yes.

Upon the subject of trusts—I feel a little reluctant about going into that—

Q. (By Senator KYLE.) (Interrupting.) You are organizing a great big one yourself.—A. Yes—on account of its partaking more or less of a political, partisan character.

Q. It is an economic question. It is contended by many economists that trusts should be a benefit to the American people and will be. What do you think of it?—A. I just had a discussion here the other day with a friend of mine. I see the kid-glove people are thinking of going into the manufacture of gloves, and will probably invade the European countries, and that they intend to do away with the jobber and the traveling man and the advertising department and the retailer, and put their gloves on sale in one store in any particular city or town that they choose to use as a distributing point. These men claim that they are only getting 10 per cent upon the value of their product in the roundabout way that it goes now to the consumer. They made up their mind they could dispense with the jobber and the retailer and the traveling men and all that sort of thing and get about 40 per cent for their product.

Q. Without additional cost to the consumer?—A. Without additional cost to them. They now go to work and say, We will reduce that to the consumer; we will sell it to them at 20 per cent, and we will get 20 per cent, and in that case the consumer is actually the beneficiary. All trusts are not as philanthropic as these

people are, and the point I wanted to make was that if this was State socialism the State would get the benefit of that condition, the reduction of the cost of manufacturing the article, while it now goes to build up the trust. I believe that if State socialism should control those trusts and those combines it would be a benefit to the whole.

Q. And then you would get every product of industry into the hands of the State before you got through?—A. Where there is a combination to strangle competition let them pay as a penalty the portion of the dividends which are paid on watered stock. The trusts are bringing on a state of socialism that the most ardent socialists never dreamed of. It is hastening rapidly in that direction. We have people up in our State—one of those men will appear before you, and he will tell you that there are 350,000 traveling men, and that 10 per cent, 35,000, have been out of a job, and the wage list of those people have been \$17,500,000 a year; and of those who are left the reduction which has taken place since the organization of these trusts has amounted to \$17,500,000 more, making \$35,000,000 reduction in the wages of traveling men alone as a result of these trusts.

Q. (By Mr. CONGER.) That is, in the United States?—A. Yes.

Q. Who compiled these figures?—A. The president of the National Traveling Men's Association. He will be one of your witnesses up in Minneapolis.

Q. Anything further on trusts?—A. As I said—I want to be frank about it—the only way we are going to fight trusts is with a cooperative trust. We will prevent those fellows from forming a trust by which we will be tributary to their demands. In other words, we will resist their attempt to throttle us by getting our goods away from us for less than we are entitled to.

Q. Are you interested in existing pure-food laws?—A. Yes; all farmers are interested in pure-food laws.

Q. Should they be State or Federal, in your judgment?—A. I think there should be a Federal law, from the very fact that our main products, all our American products, must stand the test of reliability in the markets of the world; and any agency that will establish thoroughly the reliability of our goods will give them a market value greater than if any suspicion attached to them.

Q. (By Senator KYLE.) National inspection and brand?—A. Everything should be branded as it goes out, because those things will eventually come back on the farmer. To illustrate that point, if our grain in Minnesota was removed from the control of the many hands through which it would pass, the grain of Minnesota would have in the markets of the world a premium of 3 or 4 cents a bushel. But it is so degraded by the time it reaches the selling point that its value is gone; it is degraded; it has passed out; so that the grade which the farmer must part with is a very different grade from what is sold by the middleman in transit. Our association has absolutely passed on that.

Q. In favor of a national pure-food law and inspection law and brand?—A. Yes; and branding absolutely.

Q. What can you say of the operation of existing Federal and State laws to prevent the spread of diseases among domestic animals, etc.?—A. All that sort of thing is very important; and under that head I wish to suggest that while I have not in general very much regard for theoretical farming as given by our professors and that class of fellows in our agricultural colleges, at the same time the line of experiment which those institutions are bringing forth and presenting to the minds of practical farmers—the farm must be the final workshop that it is to be worked out of—are of immense advantage to agriculture as a whole, especially the pests, such as grasshoppers and chinch bugs and those sort of things, which the average farmer can not handle. The experience of professional men along those lines are absolutely necessary to check the ravages which would some time probably obliterate a crop, and it is absolutely necessary to sustain them, while I have, as I said before, certain opinions about these men as practical farmers.

I here introduce an article in this week's issue of our paper that will give you some idea as to how we build our elevators; also some extracts from a pamphlet covering the subject.

(The matter referred to follows.)

[F. A. and I. U. Dept. Edited by J. C. Hanley.]

ARTICLES OF INCORPORATION FOR COOPERATIVE FARMERS' ELEVATORS—IMPORTANT POINTS TO BE CONSIDERED.

In order that a uniform and important feature of organizing cooperative farmers' elevators may be put into general use, I have been repeatedly asked to furnish the main points for publication, which are here given:

1. *Name*.—Give name and location of the enterprise, viz, Farmers' Cooperative Association of New Richmond, Wis. (or any other station).

2. *Object.*—The object of this association is to conduct a general elevator business, such as buying, storing, selling, shipping, and handling grain, and buying and selling merchandise (if you choose).

3. *Capital stock.*—The capital stock of this association will consist of 500 shares at \$20 each, or \$10,000.

4. *Grain growers' and alliance societies.*—In order to secure the support and services of the business agency of the Grain Growers' and Farmers' Alliance associations, we will make all shipments through the business agency of the above-named societies.

5. *Stockholders.*—Each stockholder must hold at least one share to be entitled to a vote. Shareholders shall be limited to five shares, and each stockholder shall have but one vote, regardless of the number of shares of stock held by him.

6. *Speculating.*—There shall be no speculating in holding grain for a rise in the market. Sales of receipts to be made daily. This will prevent gambling and loss.

7. *Selling.*—When a carload of grain is in the house of a certain grade, load it and attach draft to bill of lading. Take same to your local banker and draw three-fourths of value of grain in car (which will practically be all the cash you will have invested, as the one-fourth will be left to pay freight, switching, weighing, inspection, and commission charges, balance to be returned to you when commission man has finally disposed of car and made returns).

8. *Borrowing money.*—When you borrow money, do it from your local bank if possible. Give your notes for the amount of money you need. Pay for your accommodation and let the transaction end there. Don't let the banker undertake to run your business for you. Keep him on the other side of your counter, as he keeps you on the outside of his counter. Never borrow money from a commission firm. It is the rock upon which all farmers and independent elevators split. They will offer you unlimited money to buy. This means that you will fill up your house with 20,000 to 30,000 bushels, and have \$10,000 to \$15,000 invested in grain. If the market goes up they always wait for it to go higher, and won't sell. When it goes lower they wait for it to rise, and finally sell at a loss. This creates distrust and discouragement for the stockholders and they soon are willing to part with their stock for any price, and the commission firm "scoops in" the elevator as their reward for liberality in lending "all the money the elevator wanted." By selling daily there will be no losses, and \$1,500 to \$2,000 will buy all the grain you can handle, by shipping daily and drawing on each car soon as loaded. This gives you your money to buy next day again, and so on.

9. *Commission men.*—Never take chances on sending your grain to any commission firm without drawing on them as soon as car is loaded. This will insure you against loss from careless and irresponsible firms (there are some).

10. *Elevator manager.*—Never permit your manager to speculate or gamble. Give him his instructions; then see that he carries them out.

11. *Sinking fund.*—Provide 1 per cent of the value of the business your elevator does for a sinking fund. This fund will be used for buying grain and to loan to your stockholders on grain deposited in elevator of, say, 60 per cent of value. This fund will also provide for increasing capacity of house, making repairs, and all unusual contingencies.

12. *Storing grain.*—Stockholders should have the option of storing their grain at one-half the rates charged to outsiders.

13. *Patronage.*—In order to attract the patronage of all farmers, a society of Farmers' Alliance or Grain Growers' Association should be formed out of each elevator association to back up and patronize each elevator association. This can be done by wiping out the fees and dues from these societies, and let the business which the members of these farmers' societies will bring to the farmers' elevator create the fund which the business agency can secure from the firms with whom contracts are made, to pay in a portion of their commission to the business agency. This will not cost either the elevator or the patrons of the elevator a cent, but will create a fund that can be used to build up the elevator association and extend the membership of the Grain Growers' Association, so that it will enroll every farmer in the locality who will pledge himself to haul his grain to the farmers' elevator. This will build up the elevator, the grain growers' society, and the business agency, without costing any of these interests a cent, while it will secure all the benefits of the business agency, of a personal representative at terminal points to look after their interests free of charge, and secure them elevator sites from railroad grading, docking, weighing, and looking after commission men whom we receive complaint against, and all reasonable service that can be obtained as such representatives, without cost. All stockholders are expected to haul their own grain to their elevator. The only exception to this rule is when the line elevators pay higher than their own. Give your grain to the other fellow while he buys at a loss. Haul to your own house when prices are even.

14. Margins.—Farmers' elevators are expected to pay the highest market price for the farmers' grain at their station. It is generally paid up to within 1 to 2½ cents per bushel of terminal market prices, less freight. This margin is to cover cost of operation and the dividends to stockholders. Don't make this margin too great, or you will lose your patronage.

The above features are what nearly all of our new farmers' elevators are adopting, and which are giving best satisfaction where they are in operation.

BUILDING AN ELEVATOR—POINTS TO CONSIDER IN BUILDING A FARMERS' ELEVATOR.

A few items to consider by farmers in connection with the building of a farmers' elevator:

1. Ascertain if you are getting full market prices for your grain at your local station. This is important.
2. Compare prices at your station with prices at other stations where there is a farmers' elevator.
3. After finding out what advanced price you can get by establishing an elevator controlled by yourselves, multiply this advance to the number of bushels of grain marketed at such station each year, and the amount will demonstrate what the locality has lost by the absence of a farmers' elevator. This item will determine at once whether it is profitable to build or not.
4. If you decide that it would be profitable to build, the first thing to do is to call a meeting of the farmers of the locality. (We will furnish any community literature, posters, etc., for getting up meetings free. We will appoint a chairman to call the first meeting of any one desiring to act in this capacity.)
5. Form a temporary organization, then get up a big meeting. Have it thoroughly advertised and secure all the farmers tributary to your local station to come into your organization and subscribe stock to build your elevator.
6. See that farmers own and control the stock. If any farmer desires to give up his stock for any reason, let him surrender it to the association.
7. Allow each stockholder one vote, regardless of the amount of stock owned. This puts the small stockholder on the same footing as the large stockholder, and gives much better satisfaction.
8. After subscribing be sure you pay it.
9. Decide the size of the elevator to be built. In estimating the cost of same you will be safe in estimating at 15 to 17 cents per bushel capacity on houses from 20,000 to 30,000 bushels. The larger the capacity, the less cost per bushel. The selection of the best up-to-date machinery will also figure in the first cost, but will be more satisfactory and cheapest in the end.
10. In order to secure the best results let your contract to some reliable firm who makes a specialty of building elevators. This precaution saves lots of trouble and dissatisfaction, which generally results when local builders, without large experience in this line of work, attempt to experiment in building such houses, requiring absolute accuracy and substantial foundations to prevent settling and derangement of machinery.
11. After building your elevator be sure you patronize it. Some farmers' elevator companies make it so severe that any member found hauling grain to a competitor will forfeit his stock.

RAILROAD COOPERATION IN PROVIDING SITES AND RIGHT OF WAY.

After considerable correspondence and personal conference with the general officers of the railroads operating lines in the Northwest, the general business agent of the alliance has been successful in securing the consent of every line to cooperate with this office in establishing farmers' elevators along their lines where they had sites on their right of way and where such houses would be built in accordance with the rules and requirements of the railway company, such as size, quality of structure, safety from fire, and other requirements of general interest, both to the elevator and railroad companies.

We are pleased to announce that we have been successful in changing the set policy of hostility of certain railway lines towards this character of elevators, and while there is some opposition to the erection of farmers' elevators at local points, it may be well to inform the business agent at once wherever there is a farmers' elevator contemplated throughout the Northwest, so that notice of such can be

filed with the general office, and instructions to the local agent can be given to facilitate the selection of satisfactory sites on the right of way.

The proper way to proceed is to file your application for site with your local railway agent, who forwards same to division superintendent, and so on to the proper official in charge of these matters.

In forwarding information in reference to building elevators be sure that you mention whether it is a farmers' independent or line elevator. Some roads will permit only farmers' elevators on their right of way. Give the following information:

1. Name of station and State.
2. Name of railway you desire to locate on.
3. Name of other railways at such point.
4. How many elevators in operation at station.
5. How many bushels grain marketed at station.
6. Size of elevator (capacity in bushels).
7. State whether gasoline or steam engine will be used.
8. Will you run a grinding machine or wood saw in connection?
9. Will you use grain-cleaning machinery?
10. Is the cash subscribed to build same, and what amount?

Much valuable time will be saved if these suggestions are carried out.

Address all communications to the general business agent, who will furnish general information on these subjects free to any locality desiring same.

Yours respectfully,

J. C. HANLEY,

General Business Agent, 400-401 Baltimore Block, St. Paul, Minn.

(The following is the written statement submitted by Mr. Hanley, mentioned in the first part of his testimony.)

THE CHAIRMAN AND MEMBERS OF THE INDUSTRIAL COMMISSION.

GENTLEMEN: On behalf of the great society of which I have the honor of being a member and officer I desire to express profound appreciation of and confidence in the ability and integrity of the men composing the Industrial Commission, and their full conception of the arduous labors that surround them in seeking out a remedy that will reconcile the many clashing interests and give some reasonable solution or recommendation that can be enacted into law that will bring the greatest good for the greatest number, without causing an injustice to any special interest.

I desire to offer to this commission the earnest and active support of the National Farmers' Alliance and Industrial Union of America, representing a membership of something over 3,500,000 real and practical farmers and planters within the United States.

This great society is composed of all shades of political, religious, and race opinions and prejudices of the most irreconcilable character, yet all of one mind when it concerns the interest of agriculture.

I wish to convey to your minds a couple of points which we claim will be the happy solution of prosperous farming in the United States.

I received from your honorable body some little leaflets entitled *Topical Plan of Inquiry on the Conditions of Labor and Capital Employed in Agriculture*, which contain many interesting topics which should have careful and intelligent consideration, but many being subjects upon which I have not the required data to offer, I will not attempt to touch on any except in cases where I have some definite knowledge.

I will therefore treat of such points in your leaflet as may be of general character in establishing the condition that exists among the farmers to-day in the United States, as learned from personal observation and contact with the farmers in my travels through the country in my capacity as general business agent and national organizer of the National Farmers' Alliance and Industrial Union of America.

As to Part I, section number 8, entitled "Tendency of agricultural labor to seek other employment; causes and remedies," I must say that there is a decided inclination among the younger generation to leave the farm and seek employment in the already overcrowded cities of the country. Of course there are numerous reasons given for this desire on the part of the young man raised on the farm. Chief among these is the natural ambition and impulse to rise in the world and achieve greatness and prosperity, which is deemed impossible on the farm. Another is the monotony and irksomeness which the occupant of the farm must naturally

endure, and the longing for the attractions which populous communities can furnish in the shape of sights, amusements, excitement, etc., and which are not found on the farm.

Another feature that is advanced is the drudgery and small pay on the farm in contrast with the wages paid in cities, where the employee can wear better clothes, have shorter hours of work, and all the pleasures of a large city and a better salary.

Another great factor is the lack of home comforts and pleasant surroundings, which has much to do with establishing discontent with the conditions of farm life.

We find that the discontented young man or woman coming abruptly in contact with city ways and associations, and freed from the restraint of parental watchfulness, is often the victim of low social conditions and vice, which are the beginning of depraved lives.

This lonely condition and the mental anxiety which the farmers' wives and daughters endure, make them unable to bear up under this awful strain, and without anything to relieve this awful monotony they break down and contribute a large percentage of the inmates of the insane asylums of the country.

These social conditions are considered the results of unprofitable farming, and will not be removed or reduced so long as farming remains unprofitable.

I will now consider a few of the items that contribute to making farming unprofitable, and attempt to show what unjust burdens agriculture must bear as compared with nearly every other interest, financial, social, and industrial.

Agriculture has little or meager legislation to encourage or advance its interest. It pays the highest rates of taxation, and it has no means of intelligence from the General Government but that which is often used against the farmers' interests by speculators. He has no one to whom he can turn to ask for advice and counsel when he meets with depressed markets on the staple crops that his land or locality is capable of producing. He is told to diversify his farming; he is told to raise horses, and he goes into this line of industry, and when in four or five years he has raised horses ready for the market he finds that they are not worth as much as it cost him to raise them, and this advice he finds as unprofitable as on his staple crop. He is then asked by some of those fine agriculturists, whose farming is mostly done on paper, Why don't you raise hogs? and he goes into this industry, and when he has raised hogs about ready for market he finds that hog cholera gets into his herd, or the prices on hogs drops and the profits again disappear. Then he is asked why he don't raise potatoes, and he puts in a large crop, and he finds that he can get only 10 cents a bushel for them, and this is a failure. He would like to go into dairying, and he finds that the cost is too great and the work too much for him with the facilities at his command; at the cost of providing shelter and doing the work, he is unable to bear the expense and perform the work. So the farmer turns from one crop to another without regard to the natural conditions of his locality as to climate, soil, market, and facilities for which he is adapted, and must depend on luck or the distress of other nations or localities by crop failures, or some other dire distress, that will bring him some returns for the productiveness of his land. And if he finds that his land is good, and Providence has been bountiful, and a generous harvest is on the land, then the very volume of this harvest assists in breaking down the price and robbing it of its value, and again he is obliged to see the products of his toil pass from his hand without profitable returns.

We find that as the very necessities of the farmer oblige him to market his crop at a time of year when the great volume of this grain is thrown on the market, he assists in breaking down the price of his own products and playing into the hands of the gamblers and speculators who juggle the prices so that they are generally at the lowest point when the farmers are parting with their grain, and highest in the later months of the year when the farmer has no grain for sale.

He finds himself at the mercy of greedy and unscrupulous grain buyers who rob him on grades and dockage; and in nearly every direction that he turns he finds that he is the victim, though he is of the class who are the bulwark of the nation, who are responsible for its glory and greatness, who produce nearly all the wealth, who work hardest and longest. He denies himself the luxuries and many of the necessities of life that others may revel in luxury; he finds himself the hapless victim of an industry that has not provided him with any of the advantages that nearly every other industry enjoys at his expense.

I believe that you will find practical farmers that will give you details of the unproductiveness of farming as an industry, based on actual experience for a number of years, and covering every condition of farm life, as to climate, prairie, woodland, dairying, stock, wheat, corn, cotton, sugar, and wool-producing sections.

I think that we can show you that grain and cotton, the great natural crops of the United States, are raised by the American farmer at a loss as national crops, as compared with other industrial occupations.

I will therefore direct my remarks to the subject of crops of wheat and cotton, and attempt to prove to you that these crops are raised at a loss as crops because of a lack of proper legislation, and the lack of organization and cohesive and intelligent action on the part of the farmers and workmen of this great nation.

The natural law would indicate that land should be devoted to raising that to which it is best adapted and produces in the greatest abundance.

In accordance with this line of reasoning, land suitable for raising wheat should be devoted to raising wheat, and should not be taken up with crops that are less productive. Lands suitable for raising cotton should be confined to the raising of cotton. Lands suitable for raising corn and stock foods should be devoted to stock and dairy interests, and so on down the list.

The real practical farmer who tills the soil complains that he is raising crops each year that do not bring him any profit, and that he has the figures to prove that our great national crops are raised at a loss, and that he is growing poorer each year, and to make up the loss is obliged to practice the most rigid economy, and deny himself and his family the comforts and many of the necessities of life that his tastes as an intelligent and prosperous American citizen should demand.

We believe that we can prove to you by practical farmers and planters that wheat costs 50 cents a bushel to raise, or in that neighborhood, and that cotton costs 6.4 cents a pound, and whatever the farmer or planter gets above or below these points is the measure of his profit or loss.

The prices that are usually quoted and which the public are familiar with are misleading, and seldom indicate the actual prices that the farmer or planter gets for his crop. For instance, on July 13, 1899, the market quotations were as follows on wheat, No. 1 grade:

September wheat:	Cents per bushel.
Minneapolis, Minn.	69½
Chicago 73	
Duluth 72½	
New York 78½	
Viborg, S. Dak.	53

Viborg, S. Dak., is in the wheat district, and about 275 miles from Minneapolis, and at stations farther west, say 400 miles, the price was about 45 cents; in Minnesota, 150 miles from Minneapolis, it was about 60 cents, so that an average price that the actual farmer received for his wheat was about 55 cents on that day in the wheat belt of the Northwest.

The difference between this price and the quoted prices is taken up by the fixed charges of marketing the crop after it leaves the farmers' hands.

Thus it will be seen that it costs about one-half of the cost of producing a bushel of wheat to carry it to our Atlantic seaboard after it has left the farmers' hands. This cost embraces freight charges, storage, commission, insurance, loading and unloading, etc.

It will be seen that the wheat belt is situated about midway between the Atlantic and Pacific oceans, and is naturally so situated as to enjoy the competition that European or Asiatic trade would establish, and secure the advantages which could be obtained by transportation lines east and west establishing competitive rates in order to attract the movement of the crop in their respective directions.

I believe that wheat could be moved from the wheat belt west to the Pacific coast for the same price that it costs to transport it to the Atlantic seaboard, and thus furnish a chance to cut down these rates which in round numbers are now about 25 cents per bushel, as it is well known in railroad circles that often high rates are maintained in order to provide for the cost of hauling empty cars back to bring forward the crop, and thus rates often seem high when as a matter of fact they must cover the double haul or the cost of hauling the empty cars out and the load in.

This new movement or route would become the great equalizer of rates, and would build up new industries and commerce, and help to solve much of the inequality in rates now so apparent.

There is but one thing that will regulate and make farming profitable, and make it profitable for every crop raised and for every section of the country. I can sum the whole thing up in two words—oriental markets. Give us oriental markets or more and better markets for the products of the American farm, and the natural conditions of supply and demand will regulate and control every agency of producing and marketing such products, and pay a reasonable profit to everyone connected with the crop in its passage from producer to consumer.

It is well known that we can raise more wheat, meat, and textile fabrics than we can possibly use, and what we can not consume we must find a market for somewhere. And the price which we can get for this surplus in the markets of the world is generally the price by which we estimate or name the price on the entire crop that we raise. Thus it will be seen that we raise on an average an annual crop of about 500,000,000 bushels of wheat, of which we consume about 400,000,000 at home. This leaves us with an average crop of about 100,000,000 for export each year. To be more accurate about this item and to show its variation, I quote the figures from the office of the Secretary of Agriculture, which show our exports for the year of 1897 to have been 79,563,920 bushels; and in 1898 our exports reached 148,231,361 bushels. The value of this export crop in 1897 was only \$39,920,178, while that of 1898 amounted to just \$145,648,659, or an average price of about 75 cents a bushel in 1897 and about 99 cents in 1898.

It will be seen that the export crop sets the price by which the whole crop is valued. If we have but one customer who will buy our surplus crops, he most naturally is anxious to pay no more for it than he can possibly get it for, and will use every agency to make the price as low as possible; and this is the price that is set on the entire crop of the world, and is the measure that will establish the value of farm crops of the American farmer.

Now the very necessities of the farmers compel them to market their grain in the early months of the crop year, and by the very volume of grain thus thrown on the market they assist the gamblers and "bears," who are utilizing every means to "bear" the market at that time of year when the bulk of the grain is passing out of the farmers' hands. The farmer is the helpless victim to conditions that he helps to create, without any relief of a general character to save him from the conditions that compel him to part with his grain and farm products.

We find that of the 100,000,000 bushels of grain for export, about 40,000,000 bushels are on the Western slope, and as a natural consequence must be loaded into ships and sent to foreign markets.

The very instant that a vessel clears port it is registered on the boards of trade of the world: Such a ship has cleared port, loaded with grain, containing ——— bushels, destined for Liverpool or other market.

The moment that these vessels are placed on the blackboards and marked "to arrive," they know they will arrive sometime unless they encounter storms and go to the bottom of the ocean. But, barring accidents, it will arrive, and the purchaser knows that he must take it at some figure, and he will drive as sharp a bargain as possible and bear the market to its lowest possible point.

These ships, laden with about one-half of our entire export crop of wheat, have a long and dangerous journey, being from four to five months at sea, making the trip around Cape Horn, and crossing the equator twice on the journey.

This immense volume of grain being "afloat" and marked "to arrive" at a time when the bulk of the farmers are parting with their grain, contributes in no small degree to the establishment of the "low prices" at which he is forced to part with his grain.

England is our chief and practically our only customer on whom we must depend to take our crops off our hands. As a natural consequence, any agency that will create competition and give us another market for our surplus products will stimulate prices which competitors will establish in order to secure the products that they must have. Any advance on the prices of such products gained by this agency will go to the producer, and he at once becomes the direct beneficiary, because all the fixed charges, such as freight rates and handling charges, are always in effect and operation, whether the crop is light or heavy, whether prices are high or low. Thus it will be seen how important it is that we have a market and trade relations with the countries of the Orient, where we would dispose of that vast volume of grain on our western slope, which can be done in 4 to 6 weeks, and get this vast volume of grain out of the way, and not let it hang like a millstone around the neck of prices on our farm products at a time of year that farmers are marketing the bulk of their products. Why not then bend every energy of this great nation to establish new and friendly relations with Asiatic countries, whom we could induce to take a large share of our surplus products, and take it at a time of year that would help to stimulate prices and compel England, who is practically our only customer, to come to our Atlantic seaboard and compete for what is left of our surplus crop, which they must do if they wish to get it.

It has been computed that the increase in price to the American farmers by the establishment of this market would be 15 to 20 cents per bushel on the export crop of wheat, and as the export sets the price of the entire crop the gain to the American farmer would be between \$75,000,000 to \$100,000,000 annually on the item of wheat alone.

How can this be done How can we get the Chinese to take our wheat flour

when they are accustomed to rice and rice-made flour? In answering these questions it must be borne in mind that we are dealing with a big proposition. Only when we contemplate the figures can we get any intelligent idea of the immensity or significance of this matter. We should first consider the fact that the great bulk of the inhabitants of this earth lays within that country of whom we have such vague and erroneous ideas and impressions. The inhabitants with whom we would have a direct and easy contact from the sea would represent a population of about 400,000,000 people. If we could get them to take the 40,000,000 bushels of wheat on our western slope it would mean that all each inhabitant would receive would be less than half a peck, or not as much as would furnish pie crust for the wealthy inhabitants of that country. This will be better illustrated by the fact that our 70,000,000 people in the United States consume annually 400,000,000 bushels of wheat, or an average of 5½ bushels per inhabitant.

In further answering this question it must be remembered that the Chinese are not all poor and ignorant, as is the popular notion with most people when speaking of the Chinese and Japanese and the people of the Orient. A large percentage of these people are wealthy or in moderate circumstances. The official, commercial, religious, and educational classes, comprise a large percentage of the people, besides the military. It would not be an insurmountable task to cater to the tastes of this large, intelligent, and wealthy middle class, and induce such people to accept a staple article of food that would be at once palatable, nutritious, and moderately cheap as compared with rice-made flour edibles. History has shown that wherever wheat flour came into competition with rice flour the wheat flour displaced the rice flour permanently.

Commerce and trade, like water, flow along the route offering the least resistance, and it now becomes the mission of our lawmakers to clear away every obstacle or impediment without regard to past policies or precedents, but with a determination to grasp the significance and importance of this question and leave no sentiment stand in the way of an early and successful solution of it.

I will now consider briefly the subject of the cotton crop and show the melancholy outlook for this vast and main crop of the South. Here we have a great crop, in round numbers 10,897,857 bales of cotton for the year 1898, of which we consumed only 3,443,581 bales. We exported the enormous amount of 7,648,690 bales. The average price for this immense crop, as given by the Agricultural Department, was 6.23 cents per pound; 5,142,866,947 pounds would be worth \$321,419,160. This price represents the price that the planters got for their cotton, plus the fixed charges of marketing it, which amount to about 2 cents a pound. The Agricultural Bureau gives further statistics on the cost of producing a pound of cotton, and places it at about 6.4 cents per pound, which would mean a net loss to the Southern planter of \$102,857,338.94, the measure of which loss he must reckon either in the shape of newly accumulated debt or the necessities of life that he must deny his family.

This latter proposition is forcibly illustrated by a letter that I received from Col. J. P. Sossaman, national lecturer of the National Farmers' Alliance and Industrial Union, living at Charlotte, N. C., who, in speaking of the cotton question in that State, remarked that cotton was so cheap and plenty that the planters' houses were full of it; so much so that the people were going naked for the want of something to wear. As cotton was so cheap that the planters measured their loss by the amount of cotton they had on hand, the more they had the greater their loss. Cotton, said he, was begging for sale at 4½ cents a pound, which must be taken out in store trade. Commenting on the shoe industry, he said that there were so many shoes in the factories that the people were going barefoot, while the shoemakers were nearly all looking for a job.

This dismal but accurate picture of the conditions of the cotton planters in the South is one that should arrest the attention of our lawmakers and secure their earnest and united efforts to relieve these conditions by the passage of such laws as will aid in restoring prosperity to the industry of cotton raising. The cotton industry is even more subject to a long continued disastrous condition than the wheat crop, on account of the fact that we consume only about one-third of our annual crop of cotton, and must rely on our export trade to take the enormous amount of 7,648,690 bales out of a total of 10,897,857 bales, of an average net weight of 482 pounds to the bale. This condition of the cotton crop was the cause of the low prices which the planters received, and it at once calls attention to the absolute necessity of extending and establishing our foreign markets and securing new customers for this staple article of agriculture before the present condition ruins the cotton industry of this nation. The condition to-day reveals the fact that the more cotton that a planter raises the greater his loss.

For the purpose of giving some adequate idea of the enormous wealth produced

from the soil by the industry of agriculture, and to give some idea of the nature and extent of the interest that is speaking, I will give an estimate of different crops and their valuations as taken from the latest statistics of the Agricultural Department. I give them in the order of their value.

Kind of crop.	Quantity.	Value of same.
Corn.....bushels.....	1,924,184,660	\$552,023,428
Wheat.....do.....	675,148,705	362,770,820
Cotton.....pounds.....	5,142,866,947	321,419,160
Oats.....bushels.....	730,906,643	186,405,364
Hay.....tons.....	66,376,929	398,000,847
Potatoes.....bushels.....	102,306,338	79,574,772
Barley.....do.....	65,732,257	23,064,359
Rye.....do.....	25,657,622	11,875,350
Tobacco.....pounds.....		125,000,000
Farm animals.....		21,987,010,407
Total value.....		3,987,203,907

¹ Estimated.² Total value.

This stupendous wealth is produced by a majority of the inhabitants of this nation, representing about 34,000,000 people. This vast multitude represents the farming industry only. Why our lawmakers turn a deaf ear to this vast multitude and these valuable interests is a wonder that I can not fathom. I have asked, Is it because they were not as good and patriotic citizens as the balance of our population? And I can find answer to this question in the following statistics of each 1,000 men of the Union Army in the civil war:

	Men.		Men.
Agriculture.....	487	Printers.....	
Mechanics.....	254	Lumbermen, miners, and railroad men.....	42
Laborers.....	141	Bankers, lawyers, doctors, and ministers.....	16
Merchants.....	35		
Editors.....	19	Total.....	1,000

The above table reveals the fact that agriculture contributes the bulk of patriotism to defend the nation in the hour of its peril, but in strange contrast is the representation it is given. We can gain a valuable lesson from the disregard in which the vocation of agriculture is held when it comes to giving it representation in our national legislature.

I can not do better than to quote from the address of Col. B. F. Clayton, president of the Farmers' Congress, at a recent convention held in this city. He said: "A biographical sketch of a recent Congress, as furnished by its members, discloses the fact that out of a membership of 444 in the Senate and House of Representatives the farming element, representing a majority of all the people, have only 83 members in the House and 1 in the Senate. The chairman of the Senate Agricultural Committee records himself as a lawyer. The only farmer on the committee is at the tail end. Ten of the 13 members of the House Agricultural Committee, including the chairman, are lawyers. The only chairmanship held by a farmer is on the Committee on Ventilation and Acoustics."

This gives an eloquent but humiliating picture of the manner in which the cause of agriculture is represented in the halls of our national legislature.

This glaring and monstrous neglect of the interests of agriculture has caused deep and permanent convictions in the minds of farmers all over the nation. They have at last awakened to the fact that if their industry is to receive any prompt or permanent measure of relief from the General Government they must be represented by men of their own calling, farmers, or those in whom they have the greatest confidence on account of previous efforts to secure legislation in the interest of agriculture. And here let me remark that the action and attitude of every member on matters in our national legislature are subject to the closest scrutiny of this fraternity, and such action will determine the future attitude of the farmers through their respective societies, whether it will be opposition or support. It is the policy of this society henceforth to use all its efforts to secure the nomination of farmers from agricultural communities on all political party tickets, and then allow its members to vote the ticket of their political choice, being thus assured that a representative of the interests of agriculture will be elected, no matter which party wins. Only cases where representatives of other interests or vocations, being identified with our interests, will be considered,

and where any national Representatives have shown hostility or neglect to or dodge measures considered of interest to agriculture, their action and attitude will be taken up through the agency of the National Farmers' Alliance and Industrial Union in every district in the nation, and the voters of such district will be given an opportunity to reward or rebuke the action of their representatives, with which they will become acquainted, through the medium of intelligence that this society will furnish its members by the distribution of literature covering the acts of such representatives in Congress or State legislatures, presenting the facts in a nonpartisan manner. Our society has become firmly convinced that these matters are more of a national than a partisan political character. Thus, we can reasonably expect the active and earnest support of each national or State legislator when a measure is presented for his consideration as a great national movement, bereft of any partisan advantage.

In justice to many of our Senators and Congressmen, irrespective of political party, whom I have interviewed on this subject, I have yet to find one who has objected to the mission or policy of the National Farmers' Alliance and Industrial Union when it became known that it was a nonpartisan society, devoted entirely to the advancement of agricultural interests. Farmers all over this nation will watch with a jealous eye the attitude of their representatives on matters pertaining to the cause of agriculture, and those who antagonize these measures will be most sure to invite and secure the united hostility and opposition of the farmers and workmen of their districts, while those who will show a friendly interest in these matters will receive the hearty approbation and support of our association, irrespective of what political party such Congressman or Senator belongs to.

The same line of reasoning and argument given to the two great staple American crops—wheat and cotton—would apply with equal force to the numerous other crops. The following table will show the articles exported in 1898 from the American farm, in their order of quantity and valuation:

	Quantity.	Value.
Cotton.....	pounds.. 3,850,284,295	\$290,442,215
Wheat.....	bushels.. 148,231,261	145,648,659
Corn.....	do..... 208,744,989	74,196,850
Wheat flour.....	barrels.. 15,349,943	69,263,718
Bacon.....	pounds.. 650,108,933	46,390,018
Lard.....	do..... 709,344,045	89,710,672
Cattle.....	head..... 439,225	37,827,509
Fresh beef.....	pounds.. 274,768,974	22,968,556
Tobacco leaf.....	do..... 252,258,902	21,924,337
Oats.....	bushels.. 69,130,288	20,622,914
Hams.....	pounds.. 200,185,861	18,937,635
Oil cake and meal.....	do..... 1,368,186,702	12,601,820
Cotton-seed oil.....	gallons.. 40,230,784	10,137,619
Fruit.....		8,851,878
Rye.....	bushels.. 15,541,575	8,535,799
Oleo, tho oil.....	pounds.. 132,579,277	7,904,413
Horses.....	head..... 51,150	6,178,589
Barley.....	bushels.. 11,235,077	5,542,040
Pork, pickled.....	pounds.. 88,183,078	4,906,961
Cheese.....	do..... 53,167,290	4,599,324
Butter.....	do..... 25,690,025	3,964,765
Beef, canned.....	do..... 37,709,570	3,279,057
Tallow.....	do..... 81,744,809	3,141,653
Glucose.....	do..... 193,864,605	2,871,839
Hops.....	do..... 17,161,699	2,642,779
Beef, salted.....	do..... 44,314,749	2,368,467
Grease, soap.....		1,964,565
Clover seed.....	pounds.. 31,155,881	1,892,806
Sausage skins.....		1,621,519
Corn meal.....	barrels.. 827,651	1,706,078
Oat meal.....	pounds.. 85,500,350	1,757,978
Distilled spirits.....	gallons.. 2,592,713	1,651,123
Starch.....	pounds.. 72,806,313	1,371,549
Bran and mill feed.....	tons..... 91,189	1,339,896
Sheep.....	head..... 199,690	1,313,866
Hay.....	tons..... 81,827	1,151,273
Lard substitutes.....	pounds.. 21,343,028	1,118,699
Beans and peas.....	bushels.. 854,284	1,094,094
Molasses and sirup.....	gallons.. 11,391,870	1,061,989
Hides and skins.....	pounds.. 11,596,073	1,016,073

By proper and intelligent business enterprise we could expand our markets and for each article find a most extensive and highly profitable market in this vast Oriental country. For the farm products which we could dispose of in the Orient

we would take in exchange large amounts of coffee, sugar, hides and skins, silk, vegetable fibers, wool, fruits, tea, tobacco, wines, rice, cocoa, indigo, spices, etc.

By systematic and intelligent display of the exchanges which we can make with those countries, and the proper showing to such countries that it would be to their advantage to reciprocate with us in the exchange of their products, we would before long break down the barriers of national prejudice and ignorance for which the inhabitants of the East are noted. With this object in view it should be one of the first duties of this nation, after treaties favorable to this nation have been secured, to establish and maintain permanent exhibits of all the natural and manufactured products of this nation in every large city in the countries from whom we can obtain concessions, and make such displays with the view of catering to the notions and prejudices of the citizens of such countries.

We should maintain permanent and conspicuous space in the native newspapers and magazines of these countries, and present with all the skill of Yankee enterprise the merits of our goods in their native language; have our representatives in charge of these national exhibits learn the language of the country, and keep these exhibitions open daily, and have them in such prominent places and so attractively conducted that they will invite general inspection from the inhabitants, and use every means to educate the people in the nature and character of our goods, with their uses and prices, and popularize our goods and products with the natives.

We should learn to cater to their ways of doing business, their customs, their mode of giving credit, the manner that they desire to have goods shipped to them, the sort of packages they are used to shipping goods in, and in fact in every way seek to please the notions and tastes of our customers.

Congress should make liberal appropriations to establish and maintain these national exhibits, and publish frequent articles in the native press and magazines, giving the nature and characteristics of our goods, with full and complete information covering every range of inquiry. We will find that we are far behind in the procession on these matters. Already England, Germany, France, Russia, and Italy have these matters well under way, and are most liberal in the expenditure of money in this sort of advertising, and have, as a result of this enterprise, secured a strong foothold in China and adjoining countries.

Never was a nation situated so favorably as the United States to-day before the nations of the world. We are at peace with every nation on earth, except a few unfortunate people who mistake our intentions and have brought on a cruel war.

This is the opportunity of the United States; the conditions are so favorable that all it requires is a bold and determined stand on our part, and the battle is ours. Let us say to the nations of the world that, pursuing the policy of our nation since its foundation, we are the friend of the weak and struggling nation, and we will not permit might to rule against right. The 4 great powers to-day in China are seeking to carve that unhappy country up into provinces and spheres controlled by marauding nations, who are glaring and snarling at each other with jealous fears that one rival may secure an advantage over the other. The very condition of these great nations makes us strong and fortifies our policy and position on the Eastern question. We have but to say "Hands off," and these nations, with whom we have the most friendly relations, are willing to obey, rejoicing in the satisfaction that their hated rival must also retire from its sphere of influence. What would this mean for the United States? It would mean that we would earn the lasting gratitude of the Chinese nation and secure all the advantages of a favored nation in the shape of commerce and trade. This is what we want; that is what we must have if we expect to grow and expand as we have been. This is the question which will challenge the attention of our best statesmen, and provide the opportunity to take a tremendous stride in advance, and secure for this nation the good will of China and its vast population, and remove many of the obstacles that now lie in the way of securing this great multitude as customers for our vastly increasing products, which must find a market or we will become a pauper nation. The downfall of our country will date from the hour that we fail to make the occupation of the farmer and laborer profitable in this nation. We have everything to gain and nothing to lose by following this well-established policy of this nation, and by applying sagacity and enterprise to the successful operation of this great, profitable business.

We now come to the next great proposition, which is second only to the interest of agriculture, and in a measure its twin sister, as on it must we rely for the carrying out of the details in the successful operation of our foreign markets after they have been secured.

This phase of the question deals with the interests of labor as well as agriculture, and affects both ends of our organization, represented in agriculture by the National Farmers' Alliance, and in labor by the Industrial Union end of our or-

ganization. This organization represents labor, both organized and unorganized. We will consider briefly the subject of "American ships a necessary factor to establish and maintain our foreign markets."

It is a sad and humiliating spectacle for a great nation like the United States to be compelled to permit foreign ships to come to its doors, load up its products for export, and bear them away to foreign markets. Many nations boast of their greatness because of their commerce on the seas. Why can not the United States also be rated as a maritime power? Is it because we are too weak to engage in this line of trade? Is it because we have not the capital necessary to build a fleet of ships? Is it because we have no products to carry when they are built? Is it because we lack enterprise and patriotism? Is it because we have no idle workmen to employ in such enterprises? Is it because the American sailor is afraid of the sea? To all of these questions I can answer emphatically, no.

But like with all great nations, often the most important matters are lost sight of in the mad scramble for development and wealth, and because of a lack of such organization as would give dignity and influence to any demand coming from sources of recognized character and standing. "What is everyone's business is no one's business" is a true saying, and here it is exemplified with full force.

This nation has recently shown that it has some claim for recognition as a power on the seas. Its splendid victories in the recent war have been a source of pride and exultant joy to ourselves and a revelation to jealous nations who never considered the Yankee of any consequence on sea.

One of the first requirements of this nation is the establishment of the merchant marine to such size and character as befits the dignity of this nation as one of the leading powers of the world. As it is now we have nothing worthy of the name of American ships. It is our first duty as citizens, from the standpoint of patriotism, to see that American ships be built. Whatever obstacles are in the way of achieving this object should command our earnest and practical efforts to remove, and to apply such remedies as will insure the speedy and permanent establishment of our merchant marine.

It is the duty of every patriotic citizen of this nation to speak out and demand that our shipping should be restored to the sea, and restored as quickly as possible. It will be seen what advantages this will give this nation and its citizens. It will at once place at the disposal of the nation in time of war a fleet of vessels second only in importance to our Navy in the successful operations of a great war. It may not be always our good fortune to engage with a weak and disabled nation like in the war just closed. The building of our merchant ships, while being a great resource for the nation in time of war, offers at once the most profitable and important industry in this nation left undeveloped. New markets can be found and extended that will absorb the products of the farm and the manufactured products of labor. It will create a new industry in the United States—shipbuilding—and a new occupation—that of the American sailor. The establishment of this new industry will create new demands for labor, and will multiply the industries of the forest, mine, and workshop to make and fashion the materials necessary to build a modern ship, and then to man the same with American sailors, mechanics, and officers in steady and profitable employment. Then we can earn a portion of the \$200,000,000 which we pay annually to the owners of foreign vessels to carry our people and products to and fro. With this enterprise thoroughly established and equipped it would take, by a conservative estimate, 500,000 men from the ranks of idle labor, who would each earn on an average \$60 per month, giving us a grand total of increased wages of \$360,000,000 annual y. It will furnish a permanent investment to capitalists of about \$100,000,000 that will be turning out new vessels annually, and repairing old ones to cover the seas, and eventually carry all our own products, and enter the field of foreign commerce, and earn dividends for their owners, and bring vast incomes to this nation that now go to build up foreign nations through their commerce.

Owing to the generous treatment that foreign nations give their shipping and commerce, we are at an immense disadvantage if we do not receive Government aid in starting this enterprise for the first 10 or 20 years, in the shape of bounties, or at least as long as we would have to compete with other nations who would continue the present policy of subsidizing their commerce.

Let us consider for a moment what we could accomplish with an apparent small outlay in this matter. We could clip from the river and harbors appropriation and from the public buildings appropriations for many and useless and often reckless expenditures of money, and save say \$25,000,000, which we could use annually for the purpose of establishing and maintaining our American ships and its commerce, and never miss it. Say that we would pay \$3 per ton for all agricultural and mineral products; let us say that this fund would encourage enough

new ships to give us a fleet of vessels, two of which we could have leaving our western ports daily with 10,000 tons capacity each, which would be 20,000 tons of freight daily. We would have shipped abroad in 800 days 6,000,000 tons. At \$2 per ton that would only be \$12,000,000, and leave \$13,000,000 to establish and maintain a great national exhibit in the oriental countries, which would contribute in no small measure to the increased orders that our new-found customers would give for our products.

When we contemplate for a moment that our national legislative appropriations reach the enormous figure of \$1,000,000,000 in one year, this sum must appear very insignificant. It would give the proper encouragement to timid capitalists, who would be obliged to invest immense sums in plants that would be capable of engaging in this gigantic enterprise. And it is but fair, when we consider the generous protection that nearly every kind of manufacturing industry has received from our Government in the shape of tariffs and protection for many years. We find those enterprises now gigantic affairs, having grown to their present stature through the liberality of our Government in aiding those enterprises.

Subsidizing our merchant marine would be practically granting an export bounty on the agricultural and mineral products of the nation. It will be found that the most hostile competition will be inaugurated by the ships of other nations, to hold the trade that they have already secured and extend their interest. Rates that have been practically prohibitory will be readjusted as a consequence of the fierceness of this competition. Thus we will find that this new policy will be the great adjuster of rates on the Pacific Ocean. And it will permit the enterprise to successfully compete with those nations through these subsidies, which under any other condition would drive our ships from the seas.

It will thus be seen that the producers of the products enjoying this bounty will in the end be the beneficiaries, as it will assist to remove the obstacles that now practically keep his goods out of the very market that he desires most to enter. As every cent reduction which these goods can secure in getting to the markets of the world is just so much in their favor, it will give them an advantage over the same goods of other nations to the extent of this reduction of cost to carry to market.

Now let us glance for a moment at what a fleet of vessels we would require, and see the vast outlay that must be made before there would be any income from this investment. Let us suppose that it would take these 2 ships 8 weeks or 56 days to make a round trip. It would require a fleet of 112 ships to keep up this regular time sailing schedule of 2 ships a day, including time of loading and unloading. A vessel of 10,000 tons capacity, built on the latest and most improved style, would cost at least \$1,000,000, and for the 112 vessels the cost would be the enormous amount of \$112,000,000, without saying anything of the investment in the plant, and all the preliminary expense that would be necessary to establish and maintain a vast enterprise like this.

With this small outlay we can establish this gigantic enterprise and establish speedy communication with daily regularity and on an immense scale. It would be a most potent factor in attracting the trade of the Orient, because of its definite and speedy character, as it is well known in commercial enterprises that time is money.

With this condition we would be able to dispense with the services of foreign ships in carrying our produce, who are often hostile to the introduction of our goods in foreign markets, as they may come in competition with the products of their countries. This it will be seen is most necessary, from a glance at the advance of freight rates. It was only a few years ago that we first commenced to trade with Japan, and only recently with China, and the first shipments of flour made were taken at \$2.50 per ton. As time went on and the demand became greater the freight was raised from \$2.50 to \$3 and \$4, and lately it raised as high as \$6 a ton, which would be considered practically prohibitory rates. But I understand that at even these enormously high rates one-half of the flour offered for shipment has to be refused on account of no vessels being built to take care of this quickly increasing trade in the Orient. I understand that 100,000 bales of cotton were refused for the same reason, that there were no shipping facilities; also 50,000 tons of steel rails were refused for the same reason. I also understand that all the available shipping capacity was contracted for in the early spring months up to the middle of August.

It will be readily seen that the establishment of those vessels would soon establish competition on the Pacific trade that would reduce those enormous freight rates and remove what is now practically a prohibitory tariff on our staple articles of production and manufacture.

In considering this proposition it must be borne in mind that we do not contemplate invading the Atlantic commerce, as it would be useless to try in that

already well-equipped commercial field. We have only a small market in that direction, and have practically all that we can get, so there is no use in wasting any energy in trying to secure that which we have already. Let us continue on good terms with all our customers in Europe, but let us bend every energy in securing the trade of the Pacific, which is anyone's yet; let our Yankee enterprise assert itself and secure our share of that vast trade now opening up to the world.

CHICAGO, ILL., August 12, 1899.

TESTIMONY OF MR. JOHN HILL, JR.,

Commission Merchant, Chicago, Ill.

At a meeting of the subcommission on agriculture in Chicago, Ill., August 12, 1899, Mr. A. L. Harris presiding, Mr. John Hill, jr., was sworn as a witness and testified as follows:

Q. (By Mr. A. L. HARRIS.) You may state your name.—A. John Hill, jr.

Q. And your place of residence?—A. 1750 West one hundred and seventh street, Chicago.

Q. Occupation?—A. Commission merchant.

Q. How long have you been engaged in the business of commission merchant?—A. I have been engaged in the grain business since 1876. I was out of the grain business from 1897—about two years—during 1897 and 1898. I was connected, however, with the board of trade during all that time and interested, but I was not directly in the grain business until the spring of this year.

Q. Are you in the general commission business?—A. Yes.

Q. Now, you may make your statement in your own way without interrogatories, so far as possible, and introduce such exhibits at the proper places as you desire.—A. I wish to call the attention of the committee in the first place to the fact that Chicago is the greatest grain market of the world. For last year the receipts of grain were 320,000,000 bushels. Wheat represents about 9½ per cent of the total crop of grain in this country. One of the most important features of the handling of grain in Chicago is its storage; and it being at the end of the railway lines and the beginning of water navigation, it has become necessary to establish large and numerous elevators here. These elevators were first built in the 50's; possibly as early as 1848 there was an elevator in Chicago. As the Western roads brought grain to Chicago and as the grain business increased they all, or nearly all, built railway elevators, or built elevators as terminal depots for their grain. In 1870 the State of Illinois found it necessary to control the handling of the elevators, owing to the fact that there had been some proceedings that were detrimental to the grain interests of the State, and at the constitutional convention of that year an article of the constitution, which was adopted in either 1870 or 1871, was devoted entirely to instructions to the legislature in regard to making laws concerning the inspection and storage of grain, which laws, it was stated in the article, should be construed liberally in the interest of producers and shippers. During the period from 1871 until 1887 there was very little if any difficulty in the manner in which the grain was handled in these elevators. The public used them entirely. They were recognized as the terminal freight depots for grain received from the various roads in Chicago, and were so treated. They were handled by disinterested parties engaged solely in the warehouse business, and the independent shippers and receivers of grain in Chicago and at outside points owned and controlled the grain that was stored in these houses. The rate of storage was fixed at the beginning of each year as provided by law. It was a published rate and the same to all persons. Following the enactment of the interstate-commerce law, the elevators during the next 3 or 4 years passed out of the hands of the people who had devoted their entire time to the warehouse business and passed into the hands of people who immediately embarked in the grain business in addition to doing a warehouse business. As this state of affairs progressed it gradually drove the public out of the public warehouses, so that they could not handle the grain in the houses in competition with the people who operated the houses for the railroads, as the storage charge which the public had to pay made it impossible for them to compete with the operator of the public warehouse, who, if he paid any storage at all, paid it to himself. The entire method of handling grain in the elevators changed between the years 1887 and 1892. It became necessary during the investigation of these matters for us to examine the recorder's books of Cook County as to the stockholders, etc., in the various elevator concerns. I wish to introduce here as part of the record, and to show

that the railroads were to a greater or less extent, either directly or through their officers, interested in the elevators, a copy of the records of Cook County relating to the incorporation of these companies.

The following is a copy of the list of the stockholders of the Central Elevator Company, the terminal elevators of the Illinois Central Railroad. This list of stockholders contains the name of almost every officer of that road, including one party who was president and one who has since been president:

[Central Elevator Company, Records No. 21, p. 323. Incorporated in Illinois, December 13, 1886, for 99 years. Capital stock, \$100,000—1,000 shares, \$100 each.]

Original stockholders.	Shares.	Value.
J. C. Clarke.....	150	\$15,000
John Dunn.....	100	10,000
A. G. Hackstaff.....	100	10,000
S. Fish.....	150	15,000
E. T. Jeffrey.....	150	15,000
J. C. Welling.....	150	15,000
Henry De Wolf.....	100	10,000
C. A. Beck.....	100	10,000
Total.....	1,000	\$100,000

Object of company, to carry on the business of a grain warehouse and the storage and handling of grain, seeds, and other like products.

THE WITNESS. The next is the Chicago Elevator Company. It operated 2 elevators here, and that company is still in existence with Russell Sage as president, and one of the prominent stockholders on the list is Jay Gould. The elevators operated by this company were the Wabash Company, the terminal elevator of the Wabash road, and the terminal elevator of the Chicago and Eastern Illinois road, the Indiana elevator.

(The following is a copy of the records as to the Chicago Elevator Company:)

[Chicago Elevator Company, Records No. 26, p. 300. Incorporated in Illinois May 20, 1888, for 99 years. Capital stock \$500,000—5,000 shares, \$100 each.]

Original subscribers.	Shares.	Value.
Estate of Perry H. Smith, P. H. Smith, jr., executor.....	500	\$50,000
John Hurd.....	500	50,000
C. B. Cummings.....	250	25,000
S. C. Reynolds.....	250	25,000
Russell Sage.....	250	25,000
Sage & Hurd (trustees).....	1,875	187,500
A. L. Hopkins.....	875	87,500
Edgar T. Welles.....	250	25,000
Jay Gould.....	250	25,000
Total.....	5,000	500,000

Object of company, to receive and handle grain in warehouses and elevators constructed or acquired for that purpose, and the transaction of a general storage and warehousing business.

The WITNESS. The next is the record of the corporation known as the Armour Elevator Company, of which P. D. Armour is the most prominent stockholder; and he is also one of the directors of the St. Paul road. This elevator concern, at present capitalized for \$100,000, now controls all the public storage on the St. Paul and Chicago, Burlington and Quincy railroads. The elevators on the St. Paul road were built by the Armour Elevator Company; but the elevators on the Chicago, Burlington and Quincy road, having a capacity of between six and seven million bushels, were leased by the Armour Elevator Company from the Chicago, Burlington and Quincy Railroad. Of the Chicago, Burlington and Quincy elevators, all have been reduced from public to private warehouses and are used entirely, with the exception of one house of 800,000 bushels, for the private use of Armour & Co. In other words, the public have now 800,000 bushels of room on the Chicago, Burlington and Quincy road where formerly they had between six and seven million bushels room.

(The following is the record:)

[Armour Elevator Company, Records No. 25, p. 269. Incorporated in Illinois March 14, 1888, for 99 years. Capital stock \$100,000—1,000 shares, \$100 each.]

Original subscribers.	Shares.	Value.
Philip D. Armour	490	\$49,000
Jonathan O. Armour	500	50,000
D. L. Seymour	10	1,000
Total	1,000	100,000

Object of company, to carry on the business of warehousing and handling grain, seeds, and like products in the city of Chicago, Ill., and elsewhere, and to deal in such grain, seeds, and like products in connection with such warehouse business.

The WITNESS. The next is the record of the incorporation of the Santa Fe Elevator and Dock Company, of which Charles Counsellman apparently was the moving spirit, and which was the first of the great elevator systems to be passed over into the hands of the grain dealers. I wish to state that the Illinois Central Railroad owns its terminal elevators and leases them at present to Carrington, Hannah & Co., who are the owners of stock in the Central Elevator Company. Carrington, Hannah & Co. are a grain-shipping firm, and control all of the grain that comes in and out of these public houses. Recently they have taken one of the Illinois Central elevators and made it a private warehouse; so that they do their private business through it, and the public are barred out. The Santa Fe elevator is at present under lease to a corporation known as the Richardson Company in Chicago. It is no longer a public house, being used for the private business of the Richardson Company.

(The following is the record:)

[Santa Fe Elevator and Dock Company, Records No. 22, p. 518. Incorporated in Illinois July 7, 1887, for 99 years. Capital stock \$2,000,000—20,000 shares, \$100 each. Capital stock reduced to \$400,000 April 27 1888.]

Original stockholders.	Shares.	Value.
John B. Cohrs	1	\$100
Charles Counsellman	1	100
S. A. Kent	1	100
C. R. Cummings	1	100
J. J. P. Odell	1	100
P. A. McEwan	9,998	999,800
Amicetto Hoyos	9,997	999,700
Total	20,000	\$2,000,000

Object of company, to erect, build, and purchase, operate, lease, and demise elevators and warehouses, and to construct, build, purchase, maintain, operate, lease, and demise docks.

The WITNESS. The Rock Island elevators, being the terminal elevators of the Chicago, Rock Island and Pacific road, passed into the hands of Charles Counsellman, and at present one of them is being used as a private house, while the other is a public house. The proprietors of these public warehouses are the most extensive dealers in grain on the roads of which these houses are the terminal depots, and own to a great extent all the grain that is stored in these houses. The public can not successfully handle grain against them, as the charge for storage which the public has to pay bars them as competitors of the elevator people, who pay storage to themselves. The effect has been that grain coming to Chicago on any line of road where these conditions exist, grain that inspected of a grade that would of necessity go to elevators, found but one buyer, the elevator proprietor, as he alone would buy the grain that went into that house. It was in evidence in 1896, when the matter was tried before Judge Tuley, that the elevator proprietors at that time owned 75 per cent of all the grain in the elevators in Chicago; and I wish to introduce part of the decision of Judge Tuley, and also part of the decision of the supreme court affirming Judge Tuley, as they contain many valuable statements in regard to the conditions under that system here at the time, and in regard to the practical monopoly of it.

(The parts of the decisions referred to follow:)

In the circuit court of Cook County.

People ex rel. attorney-general v. Central Elevator Company.

INFORMATION FOR INJUNCTION.

TULEY, C. J.:

It is unnecessary to review the voluminous pleadings in this case. It is sufficient to state that this is an information filed by the attorney-general against the defendant corporation, licensed under the State law of 1871 to carry on the business of a grain warehouse of Class A under said statute, seeking to enjoin the defendant from buying, storing, and mixing its own grain with that of others stored in its public warehouses, or, in other words, from dealing in grain and mixing the same with that of its customers.

The defendant company substantially admits that it has for a considerable time dealt in grain and stored and mixed grain bought by it in its public warehouses, and alleges that it is advised by counsel that it could lawfully do so. This is one of nine suits brought by the attorney-general against certain corporations, firms, and individuals, owning or operating the 29 public warehouses in the city of Chicago. The defendants in these suits are all licensed as public warehousemen, and although some of the licenses include the privilege of dealing in grain, the issue in all the cases is practically the same, as the license could confer no right to deal in grain unless the law under which it issued would justify such dealing.

This litigation involves the construction of the statute of 1871 concerning warehouses and the rights of public warehousemen under said act to deal in grain and mix the same with that of their customers, stored in such public warehouses.

The evidence as to the warehousemen of Chicago so dealing in grain prior to 1872 is confined to the dealings of a very few of such warehousemen, and much of the evidence is conflicting.

While the evidence, as stated, fails to show any long-continued, well-known and uniform custom for warehousemen to deal in grain, such as would incorporate such custom into the constitution of 1870 and the law of 1871 and make it practically a part thereof, it must be admitted that the constitutional debates show that it was alleged in convention that the warehousemen in the country did deal in and mix their own grain with that of their customers, and that the warehousemen in the city of Chicago in some manner, in combination with the railroad, "to a large extent controlled the grain market of Chicago."

The great weight of the evidence is to the effect that the warehousemen of Chicago did not commence to so deal in grain to any general extent until about the year 1885; that the practice has grown so rapidly that now and for 2 or 3 years last past they are the principal buyers and sellers on the Chicago market and upon the Chicago Board of Trade; that by reason of the advantages they possess, and by reason of certain changes in the grain trade, they have practically driven out of business the class of men who were before then engaged in buying and shipping grain on the Chicago market. And it is admitted that they have dealt in grain to the extent that they now own at least three-quarters of all the grain stored in the public warehouses of the city of Chicago, and it also appears by the evidence that they are fast monopolizing the business of dealing in grain in the Chicago market.

It appears that the present condition of the grain trade and the relation of the public warehouseman to the same has been brought about by reason of the following, among other causes:

About or shortly before the time the warehousemen commenced to be generally known as dealers in grain, the railroads made regulations by which grain could be easily sold upon track. Before that time the railroad regulations were such that nearly all the grain received was forced to go to a public warehouse, which issued its receipt, stating the quantity and grade of the grain received, and this receipt was bought and sold on the board of trade and in the Chicago market, but by reason of the facilities offered by the railroads for selling on track, there soon arose at Chicago and other grain-buying centers of the country, the practice of buying grain upon the railroad track. A certain time was given, by the railroad, now 24 hours, for inspection, and 72 hours for its removal, without charge as was made theretofore for demurrage by reason of detention.

About the same time, and partly by reason of the practice of selling upon track, a practice grew up of selling by sample, and became quite general in Chicago and upon its board of trade, and there arose during the eighties among the railroads a system of what was known as "through billing" of grain from the point of production to any designated point east of Chicago, generally New York, which operated to discriminate against Chicago.

For example, if a producer or shipper west of the Missouri River desired to ship to Chicago he could obtain a freight receipt showing the grain was shipped to A B, consignee, New York; this was indorsed, "Notify A B, Chicago," and when the grain arrived in Chicago A B had the right to sell on track, and also the right to change once the name of the ultimate consignee and the designation of the place to which the grain was to go; or he could stop the grain in Chicago by paying the local rate to Chicago. The difference between the through rate and the sum of the two locals—that is, to Chicago and from Chicago to the point of destination—made a difference of about 2 cents per 100 pounds.

It also appears that the railroads made a discrimination in freights against Chicago, by which grain which would otherwise have come to Chicago was diverted to St. Louis and other points. The consequence of these changed methods of doing business was that much of the grain failed to go into an elevator or warehouse in Chicago and was shipped direct from the tracks to the East and other parts of the country, and as there was necessarily a difference in the quality of the same classified grade of grain, often arising from the grain being received from different sections of the country, the best grain was sold by sample, and only what is known as "line-grade" grain went into the warehouses. The difference in the price between what was known as "line-grade" and grain of the same grade sold by sample varied from 2 to 15 cents a bushel.

The effect of the inauguration of this practice of selling grain upon track and selling by sample and "through billing" was to greatly diminish the amount of grain that went into store in Chicago, and to lower the quality of that which did.

Notwithstanding the amount of grain going into the warehouses in Chicago in proportion to the total amount received in the Chicago market was continually growing less, the storage capacity of Chicago warehouses was continually increasing. This capacity in 1885 was in round numbers 26,000,000; in 1895 it was over 41,000,000 bushels.

The warehousemen of the city of Chicago soon perceived that if they did not buy grain in Chicago and at competing points with Chicago their warehouses would soon cease to be profitable, when used solely for the purpose of storing grain for their customers, and that the quality of the grain stored would be lowered.

There also arose in the eighties houses known as "cleaning houses," where grain was taken in at one grade, say No. 3, and came out No. 2 after being cleaned, and, if necessary, mixing therewith some better grain. This appears to have been a very profitable business, and came into competition with the storage of public warehouses. The number of cleaning houses into which grain can go under the law, and from which, if desired, it can be shipped out without inspection, rapidly increased, and now the owners of public warehouses in Chicago, many, but not all of them, are operating cleaning houses, some of which cleaning houses are adjacent to their public warehouses.

Private warehouses also arose in competition with the public warehouses and these in connection with the cleaning houses diverted much grain from the public warehouses.

Did or do these changed conditions and methods of doing business authorize or justify the warehousemen in Chicago (Class A) in going into the business of dealing in grain and mixing their grain with that of their customers?

It would seem to be clear that if the right to deal in and mix grain did not exist at the time of the passage of the act of 1871, no subsequent change in the grain trade or method of transacting the grain trade could confer the power or justify such dealing in grain.

* * * * *

It appears to the court that the question resolves itself into this, whether the said acts of the defendant corporation in dealing in grain and mixing it with the grain of its customers is an ultra-vires act, i. e., did it, in so doing, go beyond the purposes for which it was created or licensed?

What relation do these public warehouses occupy as to the State and public under the act of 1871?

These public warehouses (Class A), licensed under the act of 1871, may be said to be creations of the State, as they can not exist without such license. They are licensed for the carrying on of the business of public warehouse for the storing of grain in bulk, and in which the grain of different owners is mixed together.

Whether the warehouse or business is carried on by a corporation or an individual makes no difference as to the rights of such corporation or such individual so carrying on a warehouse business, as the rights of such corporations and such individuals so carrying on the warehouse business are the same under the law.

Being public institutions in the nature of public agencies, whether carried on by an incorporated company or an individual, they can not exceed the legitimate scope of the authority conferred by their license and the act of 1871, nor go beyond the purposes for which they were created.

It would hardly be contended that a railroad could go into a warehouse business or into the grain trade. In the Munn Case the Supreme Court says that "public policy would forbid the transaction of a warehouse business by a common carrier." The decision places warehousemen and railroads upon the same footing as being engaged in a public employment and exercising a sort of public office.

The defendant is created and licensed to carry on the specific business of a public warehouse and to use its property for that purpose, no limit being placed upon the amount of capital that may be employed. Although the license contains no express prohibition against the dealing in grain, yet the license, like the charter of a corporation, may be regarded as a contract between the licensee and the public, in which there is an implied contract that the warehouseman will engage in no other business than that for which he is licensed. Being a public warehouseman with the privileges belonging thereto, it would also appear to be against public policy that he should use his capital, his public warehouse, for the purpose of trading in grain.

Being licensed for one purpose, created by the constitution and the law for one specific business, is it not opposed to public policy that this defendant should carry on in competition with the general public another and different business, and a business in which its interests must necessarily be brought into conflict with its duties in exercising this "sort of public office?"

To restrain corporations and public institutions of this nature within the scope of the purposes of their creation is well-defined public policy.

It is in evidence that they not only own this large proportion of the grain stored in their public warehouses, and also are the principal buyers of grain in the Chicago market, but that nearly all of them deal in "futures."

It is easy to perceive the temptation they would be under as to mixing the grain of their customers, and also to control the market by the ownership of such a vast proportion of the warehouse grain. It is also easy to perceive in selling grain the temptations they would be under to abate or remit storage charges in order to effect sales.

In the case at bar it is shown that the public warehousemen of Chicago, being licensed to carry on a warehouse, have used their capital—to wit, their warehouses and their business as warehousemen—to aid them in trading in grain in competition with the public, and having a great advantage over such public in such trading, by reason of their control of such licensed public warehouses, they have become the principal buyers and sellers of grain in the Chicago market, and, upon some lines or systems of railroads centering in Chicago, almost the only buyers.

This raises the further question whether or not, while engaged in the public employment or business of warehousing, they should be allowed to use their warehouse in carrying on another business, such as dealing in grain, and thereby obtain practically a monopoly of the immense grain trade of this great grain center, where there was received by rail in 1895 over 200,000,000 bushels of grain.

A monopoly is abhorrent to the common law and the public policy of the State as manifested by its legislation, which has always been to prevent and restrain monopolies, combinations, and trusts.

See also Rump v. Chicago (45 Ill., 90).

It will be seen from the debates of the constitutional convention that one evil sought to be remedied by the peculiar legislation as to warehouses inserted in the constitution was to prevent a monopoly or combination claimed to exist between the railroads and the warehousemen in the great grain center of Chicago.

This tendency to a monopoly has not decreased, as the evidence shows that in 1895 29 public warehouses, with a capacity of 41,000,000 bushels, were controlled by less than 20 corporations or firms.

The evidence in this case shows that buying and selling of grain is fast becoming monopolized by the owners of these public warehouses, each warehouse or set of warehouses on a particular railroad or system of railroads being the principal and in some cases almost the only buyers on such railroad or system, the location of such warehouses on the Chicago termini of such railroad or system, giving them an advantage not possessed by other buyers who have no public warehouses.

The evidence shows that the warehouse proprietor often overbids private bidders for grain on "track," offering as much as a quarter of a cent a bushel more, and then immediately reselling the same grain to such private bidders at a quarter of a cent less than he, the warehouseman, paid, requiring, however, the buyer to take the grain from the warehouse within a limited number of days.

In this way the warehouseman makes storage which more than compensates him for the loss of the quarter of a cent a bushel on the sale. It is evidently to the advantage of the warehouseman to have as much grain as possible pass through his warehouse, and there is not only the temptation to rebate storage to effect sales, but his warehouse receipts being given credit because of being issued by a public warehouseman, he is able to turn his capital engaged in the grain trade into money quicker than he could otherwise do, and thus use his business as warehouseman to overcome opposition to him as a grain dealer.

It would seem as if this was using his warehouse business certainly in a manner not contemplated by the law of 1871 or the constitution of 1870.

* * * * *

It is, however, contended that the warehouseman gets the grain because he pays more for it than other bidders: that the constitution of the State requires the law passed in pursuance thereof to be construed "in the interests of the producer;" therefore it is to the interest of the producer that the warehouse be allowed to enter into the grain business. No monopoly in grain dealing can operate in the long run to the interest of the producer. There is no truer maxim in economics than that "competition is the life of trade." The warehouseman may be able to pay more than outside shippers or buyers until he has driven them out of the market. When he has succeeded in so doing (and the evidence shows that that time has nearly arrived) and he has practically no competition, then the producer must suffer. The law should not be so construed as to give the warehouseman the right to use his privilege, his public business as a warehouseman, to crush out competition against himself as a dealer in grain.

To so construe the law, it appears to the court, would be to construe it in the interests of the warehouseman, and not as intended by the constitution, in the interests of the "producer and shipper."

It is also contended that every man has a right to trade in grain. This may be true as to every private individual, but if he is exercising a kind of public employment, and is licensed to carry on a business impressed with a public use, with certain duties and privileges by reason of such license, the question is, "Is it or not against public policy that he be permitted to use such public employment, such public business, and such privileges to aid him in carrying on in competition with the public another and different business, and in such a way as to create in himself a 'virtual monopoly' of such latter business?" It appears to the court that there can be but one answer to the question, and that in the affirmative.

* * * * *

SUPREME COURT DECISION, JUNE 18, 1898., AFFIRMING JUDGE TULEY IN ELEVATOR CASES.

People ex rel. v. Armour Elevator Co., Central Elevator Co., Geo. A. Seaverns, Chicago Ry. Terminal Elevator Co., Nebraska City Packing Co., Alex C. Davis & Co., South Chicago Elevator Co., Charles Counselman, Chicago Elevator Co.

Mr. Justice CARTWRIGHT delivered the opinion of the court: Appellants in these nine cases were defendants in the circuit court of Cook County to informations in equity filed by the attorney-general against them as licensed proprietors of warehouses of Class A in Chicago, or stockholders of corporations so licensed. The informations made the same general allegations in each case: That defendants had stored grain owned by themselves in the particular warehouse of which they were proprietors; that not less than three-fourths of all the grain received in the public warehouses in Chicago was owned by the warehousemen; that the grades for inspection of grain were such that the grain of each grade was not of the same quality, but that separate carloads of different quality

and value were graded in the same grade; that by reason of advantages of the defendants, as owners of warehouses, in mixing and manipulating grain and rebating storage charges and otherwise, they had been enabled to drive out competition and hold and enjoy the privilege of buying grain free from competition, and that such storing of grain was unlawful and injurious to the public. *All the informations prayed for the same relief—a perpetual injunction to restrain defendants, as warehousemen, from storing grain in their own warehouses.* The answers admitted in each case that defendants were operating public warehouses of Class A, in which grain was stored in Chicago, and that they had stored grain owned by them in their own warehouses, and claimed the right to do so. The answers also set up a general custom of thirty years' standing, under which the proprietors of public warehouses were accustomed to store their own grain and mix it with the grain of their customers, and also that the warehouse commissioners had construed the act of 1871 as permitting that custom, and that such purchases of grain and such custom had a beneficial effect upon producers, shippers of grain, and dealers in grain throughout Illinois and the Northwest.

* * * * *

If the duty of the defendants, as public warehousemen, stands in opposition to personal interest as buyers and dealers in grain, storing the same in their own warehouses, then the law interposes a preventive check against any temptation to act from personal interest by prohibiting them from occupying any such position.

The public warehouses established under the law are public agencies, and the defendants, as licensees, pursue a public employment. It is clothed with a duty toward the public. The evidence shows that defendants, as public warehousemen storing grain in their own warehouses, are enabled to and do overbid legitimate grain dealers by exacting from them the established rate for storage, while they give up a part of the storage charges when they buy or sell for themselves. By this practice of buying and selling through their own elevators the position of equality between them and the public, whom they are bound to serve, is destroyed, and by the advantage of their position they are enabled to crush out, and have nearly crushed out, competition in the largest grain market in the world. The result is that the warehousemen own three-fourths of all the grain stored in the public warehouses of Chicago, and upon some of the railroads the only buyers of grain are the warehousemen on that line. The grades established for different qualities of grain are such that the grain is not exactly of the same quality in each grade, and the difference in market price in different qualities of the same grade varies from 2 cents per bushel in the better grades to 15 cents in the lower grades. The great bulk of grain is brought by rail and in carloads, and is inspected on the tracks, and the duty of the warehousemen is to mix the carloads of grain as they come. Such indiscriminate mixing gives an average quality of grain to all holders of warehouse receipts. Where the warehouseman is a buyer the manipulation of the grain may result in personal advantage to him. Not only is this so, but the warehouse proprietors often overbid other dealers as much as a quarter of a cent a bushel and immediately resell the same to a private buyer at a quarter of a cent less than they paid, exacting storage, which more than balances their loss. In this way they use their business as warehousemen to drive out competition with them as buyers. It would be idle to expect a warehouseman to perform his duty to the public as an impartial holder of the grain of the different proprietors if he is permitted to occupy a position where his self-interest is at variance with his duty. In exercising the public employment for which he is licensed he can not be permitted to use the advantage of his position to crush out competition and to combine in establishing a monopoly by which a great accumulation of grain is in the hands of the warehousemen, liable to be suddenly thrown upon the market whenever they, as speculators, see profit in such course. The defendants are large dealers in futures on the Chicago Board of Trade, and together hold an enormous supply of grain ready to aid their opportunities as speculators. The warehouseman issues his own warehouse receipt to himself. As public warehouseman he gives a receipt to himself as individual, and is enabled to use his own receipts for the purpose of trade and to build up a monopoly and destroy competition. That this course of dealing is inconsistent with the full and impartial performance of his duty to the public seems clear. The defendants answer that the practice had a beneficial effect upon producers and shippers, and naturally were able to prove that when, by reason of their advantages, they were overbidding other dealers there was benefit to sellers, but there was an entire failure to show that in the general average there was any public good to producers or shippers.

* * * * *

The WITNESS. So far as my statement concerns the elevators being the terminal grain depots of these railroads, I wish to introduce the following tariffs and notices of the various railroads, in which they name these elevators as their terminal depots or as the elevators of the company.

The first is a special joint notice, taking effect June 10, 1891. It reads as follows:

[Special joint notice, taking effect June 10, 1891, canceling circular of November 10, 1890.]

NOTICE TO GRAIN DEALERS AND SHIPPERS.

On and after June 10, 1891, the following rules will govern regarding charges on grain received at Chicago:

SECTION 1. A. Grain in bulk consigned to Chicago locally will, after arrival and inspection, be delivered to and unloaded in elevators of this company, without switching charge, unless such grain is billed track delivery or held out by consignees.

B. If billed track delivery, such delivery will be made free of switching charge.

C. If held out for the purpose of inspection by committee of appeals, no car-service charge will be made, provided disposition is made within 48 hours after being placed on appeals switching track.

SEC. 2. Grain consigned to Chicago locally billed track delivery, then ordered to elevator before track delivery is made, will be sent to elevator without switching charge, provided order is given within 36 hours after inspection when inspection is made before 10 a. m. of the day of arrival. If inspection is made after 10 a. m., the cars must be ordered before 6 p. m. the second day. Such grain, however, will be subject to car-service charges if delayed on track by consignee beyond the time specified, unless the same is held out for inspection by committee of appeals.

SEC. 3. Grain consigned to Chicago locally billed track delivery, or if held out and subsequently ordered to private tracks or to connecting lines, will be subject to a minimum switching charge of \$2 per car.

SEC. 4. Grain consigned to Chicago locally and reordered after delivery has been made to elevator or team track, will be subject to a minimum switching charge of \$2 per car.

SEC. 5. Grain ordered to private tracks, warehouses, elevators, or industries located on connecting lines, will be subject to an additional switching charge according to location.

SEC. 6. Reconsignment orders must be made within 36 hours after inspection, provided inspection is made before 10 a. m. of day of arrival. If inspection is made after 10 a. m., cars must be ordered before 6 p. m. of the second day, otherwise the grain will be subject to car-service charges.

SEC. 7. Grain delivered to team track must be unloaded within 36 hours after being placed in position to unload, provided orders are received for team-track delivery the day of arrival. If billed to team track without inspection, 48 hours will be allowed for unloading after car has been placed in position to unload.

SEC. 8. Grain consigned to points beyond Chicago, to the order of or notify a firm at Chicago, to be stopped at Chicago for inspection (which latter notation must be made on the way-bill), may be delivered to connecting lines free of switching charges, provided order is received within 24 hours after 1.30 p. m. of the day of arrival if inspection is made before 10 a. m. of the day of arrival. If inspection is not made before 10 a. m., the 24 hours will be counted from 1.30 p. m. of the following day. A minimum switching charge of \$2 per car will be made for deliveries, orders for which are received later than provided for in the foregoing rules.

SEC. 9. Delay beyond hours specified in the above rules will be subject to a car-service charge as provided for by the rules of the car-service bureau.

J. A. Hanley, freight traffic manager, A., T. & S. F. R. R.; S. B. Knight, general freight agent, Wabash R. R.; H. H. Courtright, general freight agent, C. & A. R. R.; Thomas Miller, general freight agent, C., B. & Q. R. R.; J. B. Cavanaugh, general freight, Wis. Cent. Line; J. M. Johnson, general freight agent, C., R. I. & P. Rwy.; J. H. Hiland, general freight agent, C., M. & St. P. Rwy.; H. R. McCullough, general freight agent, C. & N. W. Rwy.; Horace Tucker, general freight agent, I. C. R. R.; P. C. Stohr, general freight agent, C., St. P. & K. C. Rwy.

The WITNESS. Showing that the railroads themselves considered the elevators to be public warehouses for the storage of grain received from other roads.

The next is Illinois Central Railroad circular No. 1029, covering rules regarding grain consigned to Chicago, which reads as follows:

[I. C. R. R. circular No. 1029.]

ILLINOIS CENTRAL RAILROAD CO.
(NORTHERN AND WESTERN LINES),
GENERAL FREIGHT DEPARTMENT,
Chicago, Ill., May 3, 1895.

RULES REGARDING GRAIN CONSIGNED TO CHICAGO.

To agents, shippers, and receivers of grain:

This company, having ample storage facilities for grain in elevators on its own tracks at Chicago, will not, on and after this date, receive grain consigned to elevators off its lines in Chicago, nor switch wheat, corn, or oats grading No. 3 or higher, to connecting lines for delivery to any elevators, storehouses, or cleaning houses on the tracks of such other lines in Chicago or South Chicago.

Wheat, corn, or oats grading under No. 3 will be switched, when ordered for delivery to storehouses or cleaning houses on tracks of connecting lines, at a charge of \$3 per car for the Illinois Central Railroad Company's service, in addition to which will be added any cost for trackage that may be incurred in reaching the tracks of such other lines.

Agents will not issue receipts, bills of lading, or make waybills for grain for delivery on the tracks of other lines, or to any particular elevator, storehouse, or cleaning house, but will simply waybill to Chicago and show Chicago only as destination.

The above will not in any way change the instructions in effect as to grain destined East.

W. R. KEEPERS,
General Freight Agent.

The WITNESS. I have here 2 circulars or tariffs issued by the Chicago and Northwestern Railroad, under date of February 11, 1897, and April 14, 1898. On pages 24 and 26 of these tariffs will be found the following:

"Grain in bulk consigned to Chicago locally will, after arrival and inspection, be delivered to and unloaded in elevators of this company without switching charge, unless such grain is billed track delivery or held out by consignees."

Now, as to our efforts to get the railroads to change this system of handling our grain, I will introduce 3 requests by receivers and shippers which were made of the Illinois Central, the Chicago, Rock Island and Pacific, and the Chicago, Burlington and Quincy roads, respectively, that the elevators be handled by disinterested parties. Following these requests are the answers from the officers of the railroads; and in one case, that of the Chicago, Burlington and Quincy road, the general freight agent stated that his road would make delivery to any elevator the receivers selected, subject only to such extra charges as might be exacted from us by the lines on which the elevators are located. I have attached a tariff of the connecting line, showing that it would cost from \$3 to \$5 a car for the delivery of the grain to the connecting line.

(The requests and letters in the order mentioned by the witness follow.)

CHICAGO, July 31, 1894.

ILLINOIS CENTRAL R. R. Co.:

We, the undersigned, receivers and shippers of and dealers in grain and flaxseed at Chicago hereby demand that you furnish terminal facilities for the handling of grain or flaxseed at Chicago that will not subject our business to the scrutiny of one or more of our competitors. At present such grain or flaxseed as is unloaded for us in your terminal elevators passes into the possession of the Central Elevator Company (as warehousemen). This corporation is owned entirely by Carrington, Hannah & Co., who are competitors of ours. As you now handle the business it places them not only in possession of the goods, but enables them to exercise a complete espionage over our business, that gives them so marked an advantage that we consider it a great injustice.

A few of the advantages possessed by the lessees of your terminal elevators are as follows:

First. You place all freight bills for grain and flaxseed unloaded into your terminal elevators in their hands for collection; said freight bills contain the names of our shippers and the points of shipment.

Second. You place the grain and flaxseed in the terminal elevators owned by you but leased to the firms named above, and we have to accept their receipts for the goods. This gives them an undue advantage, as they know immediately the kind, grade, and quantity of our grain or flaxseed, as well as the shipper's name and point of shipment.

Third. If we are shipping grain East in competition with the lessees of your terminal elevators they not only have the advantage of knowing the kind, grade, and quantity of our shipments, but also have the opportunity of selecting the best grain of the various grades of grain in the elevators to fill their own orders and give us the poorest grain of their various grades when we wish to ship.

Fourth. By leasing your terminal elevators to firms who are grain dealers you immediately give them an advantage over all competitors by creating for them a margin which practically gives them a monopoly of the grain and flaxseed trade on your lines of railroad. The storage rates (three-fourths of a cent per bushel for the first 10 days or fraction of 10 days and one third cent per bushel for each succeeding 10 days or fraction of 10 days, amounting to over 12 cents per bushel per year) is in itself so great an advantage that the lessees of your terminal elevators frequently sacrifice a portion of the storage in order to force grain and flaxseed into the elevators they lease of you, so that it will be earning storage for them. They can buy grain at an apparent loss (or what would be a loss to us) and yet make money out of it through the superior advantages you provide for them.

ILLINOIS CENTRAL RAILROAD COMPANY,
OFFICE OF THE SECOND VICE-PRESIDENT,
Chicago, September 12, 1894.

N. G. INGLEHART, Esq.,
Commissioner Chicago Freight Bureau, 51 Board of Trade Building, Chicago.

DEAR SIR: I beg to acknowledge receipt of your favor of the 24th ultimo, inclosing paper signed by receivers of grain in the city of Chicago concerning the terminal facilities for the handling of grain and flaxseed on our road. This is the first complaint received by this company on this matter of which I have any knowledge. I do not see that this company could handle its elevators and give satisfaction to its patrons in any other way than it is handling them now, and secure to the company the business to which it is entitled. I have taken this matter up with Mr. John S. Hannah, the manager of the Central Elevator Company, and inclose herewith a copy of his letter to our traffic manager in reference to the charges made, which it seems to me fully answers the complaints made.

Yours, truly,

J. T. HARAHAN, *Second Vice-President.*

(Attached to the foregoing letter is the following:)

CENTRAL ELEVATOR COMPANY,
Chicago, September 5, 1894.

T. J. HUDSON, Esq.,
Traffic Manager, Illinois Central Railway, City.

DEAR SIR: In the first place, you will note that the demands made upon you is that from a very small number of the grain receivers on the board of trade as individuals, who have imaginary grievances. I will state that in order that these firms may not take any extraordinary risk in handling the grain receipts issued

by the Central Elevator Company, the elevator company is required by the directors of the board of trade to furnish a bond of \$500,000 to protect its members who handle the Central Elevator Company's receipts. The insinuation or intimation that the Central Elevator Company, or Carrington, Hannah & Co., take advantage of the situation and spy out the customers of competitors is unworthy of the notice of honorable men, and we shall not burden you with a detailed denial of such a charge. When Central elevators were leased to the present company, in order to accommodate the grain trade, it was arranged between the Central Elevator Company and the Illinois Central Railroad that the Central Elevator Company would collect railroad expense bills, as has been the custom for a number of years, and in order to do this it was arranged that our messenger at the elevator office at the foot of South Water street should deliver the elevator receipts with the expense bills attached at the elevator office on Sherman street, which is with the office of Carrington, Hannah & Co.

These receipts are delivered to our cashier, who places them in a wallet belonging to the railroad company, and when checks for the amount of the expense bill is delivered him he delivers up the elevator receipts and expense bills to their owners. This, so far as we know, is the only change in the method of managing the elevators for the past 20 years. These parties making this demand well know that the identity of grain and flax going into the elevators is not preserved, and therefore we can not know the ownership of any particular lot. As to the last charge about the firm of Carrington, Hannah & Co. possessing advantage over its competitors, it is of such a puerile nature that it does not in our opinion deserve an answer. I will say, however, that should you desire any changes made in the handling of your expense bills I shall be pleased to confer with you. At present the only parties benefited by the existing arrangements are the receivers of the grain. The rates on storage now in effect are three-fourths of a cent per bushel for the first 10 days, and one-fourth of a cent per bushel for each additional 10 days or part thereof.

Yours, truly,

JOHN HANNAH,
Manager.

(The following is the request on the Chicago, Rock Island and Pacific Railroad Company:)

CHICAGO, ROCK ISLAND AND PACIFIC RAILWAY,
Chicago, July 31, 1894.

We, the undersigned, receivers and shippers of and dealers in grain and flaxseed at Chicago, hereby demand that you furnish terminal facilities for the handling of grain and flaxseed at Chicago that will not subject our business to the scrutiny of one or more of our competitors. At present such grain or flaxseed as is unloaded for us in your terminal elevators passes into the possession (as warehousemen) of Charles Counselman & Co., or A. C. Davis & Co., both of whom are active competitors of ours; as you now handle the business it places them not only in possession of the goods, but enables them to exercise a complete espionage of our business, that gives them so marked an advantage that we consider it a great injustice.

A few of the advantages possessed by the lessees of your terminal elevators are as follows:

First. You place all freight bills for grain and flaxseed unloaded into your terminal elevators in their hands for collection, said freight bills containing the names of our shippers and the points of shipment.

Second. You place the grain and flaxseed in the terminal elevators owned by you, but leased to the firms named above, and we have to accept their receipts for the goods. This gives them an undue advantage, as they know immediately the kind, grade, and quantity of our grain or flaxseed, as well as shipper's name and point of shipment.

Third. If we are shipping grain East in competition with the lessees of your terminal elevators, they not only have the advantage of knowing the kind, grade, and quantity of our shipments, but also have the opportunity of selecting the best grain of the various grades of grain in the elevators to fill their own orders and give us the poorest grain of their various grades when we wish to ship.

Fourth. By leasing your terminal elevators to firms who are grain dealers you immediately give them an advantage over all competitors by creating for them a margin which practically gives them a monopoly of the grain and flaxseed trade on your lines of railroad. The storage rates (three-fourths of a cent per bushel for the first 10 days, or fraction of 10 days, and one-third of a cent per bushel for each succeeding 10 days, or fraction of 10 days, amounting to over 12 cents per bushel per year) is in itself so great an advantage that the lessees of your terminal elevators frequently sacrifice a portion of the storage in order to force grain and

flaxseed into the elevators they lease of you so that it will be earning storage for them; they can buy grain at an apparent loss (or what would be a loss to us) and yet make money out of it through the superior advantages you provide for them.

(Attached thereto is the following:)

CHICAGO, ROCK ISLAND AND PACIFIC RAILWAY,
OFFICE OF THE THIRD VICE-PRESIDENT,
Chicago, Ill., October 13, 1894.

N. G. INGLEHART, Esq.,

Commissioner, Chicago Freight Bureau, City.

DEAR SIR: I duly received your letter of the 8th instant relative to a petition of certain grain dealers in this city, which was sent to our Mr. St. John in August, and calling attention to the further fact that no reply had been made by us to the same.

The receipt of your letter was the first knowledge I had of the channel through which this communication came to us, and I accordingly was at a loss to know to whom to address my reply to it.

After due consideration of the matters complained of in the petition and consultation with the people who handle our grain elevators in this city, as well as with our own people, who are familiar with the details of our grain business, we are satisfied that there are no substantial grounds for the complaints made in this petition.

As I am advised by our people, they have not to their knowledge ever had a single complaint of any kind or character where information obtained by the firms handling our elevators has been misused to the disadvantage of the receivers of the grain in this city in the manner charged in this petition.

Upon receipt of any such specific complaints, we shall at any time be very glad to take them up and investigate them fully, and if there is found to be any grounds for them will apply the proper remedies.

With regard to the claims that the grades of grain are being manipulated to the advantage of the parties handling the elevators, no specific case of this kind, as I am informed, has ever been brought to the attention of the officials of this company, nor, so far as we ever heard, has any such charge or complaint been made to the authorities in charge of the inspection of grain in and out of the elevators.

We shall be pleased at any time to investigate specific complaints of this character, and if upon such investigation there are any indications of their being well founded, we will do whatever we can to correct the irregularities complained of.

Trusting this may be satisfactory. I remain, very truly yours,

W. H. TRUESDALE,

Third Vice-President.

(The following is the communication to the Chicago, Burlington and Quincy Railroad Company:)

CHICAGO, BURLINGTON AND QUINCY RAILROAD COMPANY.

We, the undersigned, receivers and shippers of and dealers in grain and flaxseed at Chicago, hereby demand that you furnish terminal facilities for the handling of grain and flaxseed at Chicago that will not subject our business to the scrutiny of one or more of our competitors. At present such grain or flaxseed as is unloaded for us in your terminal elevators passes into the possession of the Armour Elevator Company as warehousemen. This corporation is virtually Armour & Co., who are active competitors of ours. As you now handle the business, it places them not only in possession of the goods, but enables them to exercise a complete espionage over our business that gives them so marked an advantage that we consider it a great injustice to us.

A few of the advantages possessed by the lessees of your terminal elevators are as follows:

First. You place all freight bills for grain and flaxseed unloaded into your terminal elevators in their hands for collection; said freight bills contain the names of our shippers and the points of shipment.

Second. You place the grain and flaxseed in the terminal elevators owned by you, but leased to the firms named above, and we have to accept their receipts for the goods; this gives them an undue advantage, as they know immediately the kind, grade, and quantity of our grain or flaxseed, as well as shipper's name and point of shipment.

Third. If we are shipping grain East in competition with the lessees of your terminal elevators, they not only have the advantage of knowing the kind, grade, and quantity of our shipments, but also have the opportunity of selecting the best grain of the various grades of grain in the elevators to fill their own orders, and give us the poorest grain of their various grades when we wish to ship.

Fourth. By leasing your terminal elevators to firms who are grain dealers you immediately give them an advantage over all competitors by creating for them a margin, which practically gives them a monopoly of the grain and flaxseed trade on your lines of railroad. The storage rates (three-fourths cent per bushel for the first 10 days or fraction of 10 days and one-third cent per bushel for each succeeding 10 days or fraction of 10 days, amounting to over 12 cents per bushel per year) is in itself so great an advantage that the lessees of your terminal elevators frequently sacrifice a portion of the storage in order to force grain and flaxseed into the elevators they lease of you so that it will be earning storage for them; they can buy grain at an apparent loss (or what would be a loss to us) and yet make money out of it through the superior advantages you provide for them.

BALDWIN & STONE.

WANZER & Co.

HENRY HEMMELGARN & Co.

MILMINE, BODMAN & Co. (per SANBORN).

GERSTENBERG & KROESCHELL.

BOYDEN & Co.

J. C. HOWELL.

L. EVERINGHAM & Co.

SNYDACKER, FYFFE & Co.

(Attached to the foregoing is the following:)

[Chicago, Burlington and Quincy Railroad Company, Thomas Miller, general freight agent; W. B. Hamblin, assistant general freight agent; Frederick Rogers, assistant general freight agent; E. R. Puffer, assistant general freight agent.]

CHICAGO, ILL., September 11, 1894.

N. G. INGLEHART, Esq.,

Commissioner, Chicago.

DEAR SIR: Referring to your favor of the 4th, addressed to Mr. Merrill, in which you inclosed a document signed by various Chicago grain receivers in reference to the facilities for storing and handling grain in this city.

As you are aware, our elevators are under lease to Armour Elevator Company, and I do not understand why the complaint as to the manner in which grain is handled here should be presented to us. The elevator charges are something that we know nothing about and have no control over in any manner. If the facts are as stated by the signer, why do they not handle their grain through other houses; you know we stand ready to make delivery to any elevators they may select in this city, subject only to such extra charge as may be exacted from us by the lines on which the elevators are located. I do not think a fairer proposition can be made by anyone.

Yours, truly,

THOS. MILLER.

(The schedule referred to by the witness is Circular G. F. D., No. 16850, of the Chicago and Northwestern Railway, entitled "Instructions in reference to handling grain and flour in Chicago, also a list of regular elevators, irregular elevators, warehouses, mills, malt houses, breweries, flour houses and distilleries," and

dated July 22, 1895, upon page 2 of which is the following, underscored by the witness:)

"Grain in bulk consigned to Chicago locally will, after arrival and inspection, be delivered to and unloaded in elevators of this company, without switching charge, unless such grain is billed track delivery or held out by consignees."

(The following is a pencil note on the page by the witness:)

"These are the elevators of the Chicago Railway Terminal Company."

(On page 4 of the same circular is the following, underscored by the witness:)

"Except when special permission is received from the general freight department, grain will not be received at point of shipment consigned to regular elevators in Chicago located on the tracks of other roads, and all shipments for locations on side tracks of other roads are subject to the switching charges established from time to time by our connections for handling the freight after delivery to them."

"Grain from connecting lines, when for Chicago and Northwestern regular elevators, will be moved only upon special arrangement with this office, and subject to the following charges:

"From all connecting lines to the Air Line, Galena, \$5 per car.

"From all connecting lines to Iowa City, \$3 per car.

"When from Belt Line roads an additional charge of \$2 per car will be added.

"Flour in carloads unloaded by us in our warehouses at Chicago stations and not removed at the expiration of 20 days will be sent to public warehouse for storage.

"When our warehouses are full, cars will be placed on track for unloading. If cars are not unloaded within five days after being placed on track, the flour will be sent to public warehouse."

The WITNESS. In regard to the question, which has come up a number of times, as to whether the elevator people of Chicago have a combination or a trust, we discovered in 1894 that they had an association composed of all of the elevator people in Chicago. That association had a president and a secretary. When the Board of Trade found it necessary to treat with the elevator people, they found that they treated with them all through this association, and I will introduce here three letters received in that connection, signed by the secretary of the association, and he states in one who the president of the association is.

(The letters referred to follow:)

OFFICE OF THE CHICAGO GRAIN ELEVATOR ASSOCIATION,
Chicago, May 11, 1894.

GEO. F. STONE, Esq., *Secretary.*

DEAR SIR: I beg to acknowledge the receipt of your letter of current date, with inclosure. I regret to advise you that owing to the absence from the city of the president of this association, and also of another member who is largely interested, it will be impossible to get the members together to-day to consult with your president, as desired.

Steps have been taken to reach the absent members, and a meeting will be called as soon as they are heard from, date of which I will advise you at earliest moment.

Yours, truly,

E. W. THOMPSON,
Secretary, 218 La Salle street, Room 212.

OFFICE OF THE CHICAGO GRAIN ELEVATOR ASSOCIATION.
Chicago, May 12, 1894.

GEO. F. STONE, Esq.,
Secretary Chicago Board of Trade, City.

DEAR SIR: I beg to advise you that a meeting of the members of this association has been called for Monday, May 14, 1894, at 2.30 p. m., in Room 215, No. 218 La Salle street, at which time and place they will be pleased to meet your president regarding the subject-matter of your letter 11th inst.

Yours, very truly,

E. W. THOMPSON,
Secretary, 218 La Salle street, Room 212.

OFFICE OF THE CHICAGO GRAIN ELEVATOR ASSOCIATION,
Chicago, May 16, 1894.

GEO. F. STONE, Esq.,
Secretary Board of Trade, City.

DEAR SIR: I have the pleasure to acknowledge the receipt of your letter of current date and to advise you that it has been referred to Mr. Geo. A. Seaverns, president of this association.

Yours, truly,

E. W. THOMPSON,
Secretary, 218 La Salle street, Room 212.

THE WITNESS. We also found that during the past 5 years their rates had been uniform to the public; that they were represented at all times in court by the same attorneys, and that at no time was it possible to treat with one of the elevator proprietors separately. They always held together. How strong their association is, or whether there is such an association in existence now, is impossible for us to tell, except that we find them always with the same rates of storage, always treating the public in the same manner, and always represented by the same attorneys.

I will introduce here a copy of a report made to the president and board of directors of the Board of Trade of the city of Chicago by a committee appointed under a resolution adopted February 12, 1894, to investigate the methods of warehousing grain, etc. That report is the result of several weeks of investigation and the evidence of probably 75 witnesses, and it treats of the abuses and the necessary changes that should be made in the handling of grain in Chicago through the warehouses.

(The report above described follows:)

CHICAGO, April 30, 1894.

THE PRESIDENT AND BOARD OF DIRECTORS OF THE
BOARD OF TRADE OF THE CITY OF CHICAGO.

GENTLEMEN: Your committee, appointed under the resolution adopted February 12, 1894, to investigate the methods of warehousing grain, etc., would respectfully report as follows:

SECTION 1. We find that the regular elevators of Chicago are owned and operated in a variety of ways. One system is owned by an individual, who does all the business, buying, selling, and storage, in his own name. Another is partly leased by an individual and partly owned by a corporation all of whose stock is owned by this same person. Here all the business is done in the firm name and the accounts are simply kept separate on the books. Another system is leased by a corporation whose stock is all owned by the firm who operates it, and which does its own grain business largely through them. Several systems are owned or leased by corporations which do all their business in their own name. A large system is owned by a foreign corporation, which employs commission houses to do its buying and selling. The largest system in the city is leased by a corporation of \$100,000 capital whose ownership is not given. The private elevator or cleaning house connected with this system is owned by another corporation. Here the grain business is all done in the name of the firm who are generally supposed to control both corporations.

Five systems, with about 19,000,000 bushels of storage capacity, have private elevators or cleaning houses connected with them, while six systems, with 13,000,000 bushels storage, have no cleaning houses connected. All of them buy grain directly or indirectly, both here on our own board and also in the country. Some of them sell their grain exclusively on the open market or to our own shippers, while several sell in the East or ship on their own account as well.

The necessity for grain buying by these elevator proprietors is hardly well established by their own testimony. All but one claim that they pay only the market price, giving no part of their storage to the seller, while the proprietor of one system claims that possibly 40 per cent of his grain would not come to Chicago unless he bought it. *It is but fair to say that this scale of prices claimed to be paid by the elevator system is contradicted by at least one firm who are large receivers and shippers. They testify that they find it at times to their advantage to sell their own grain to the elevators and buy their cargoes back from them. In addition, the receivers generally testify that they can get more for grain to go to store than they can get for the same grain if already in store.*

All of these elevator systems are doing a warehouse business under the laws of the State of Illinois and subject to the control of the railroad and warehouse commissioners, as therein provided. The fact that public custodians, licensed and controlled by the State, handling and storing the property of hundreds of

individuals and running together and mixing the same regardless of ownership, should themselves be regular and the principal dealers in this very property of which they are custodians is, to say the least, anomalous. We do not find, however, that the railroad and warehouse law prohibits it directly, but do think that the spirit of this law is fairly against the practice.

The combination of the two occupations of a dealer in grain and an applicant before the public for the position of custodian of its property for a consideration, together with the unfair advantages liable to accrue therefrom, we believe to be against public policy, because of the danger which thereby impends on those who maintain and support those who should only act as their agents and trustees. These opportunities are of the following nature: The temptation and opportunity of contaminating the inspection department, which should, in every sense of the word, be a fair and impartial agency, operating only in the interests of the public at large. This also extends to the improper influencing of the railroads in their interest. The opportunity is given to tamper with grain placed in their care, giving them the chance to set aside and select better qualities of the same grade for themselves, thus reducing the average quality of the public grain in their warehouse, and giving an unfair opportunity for offering and selling by sample in other markets. The danger of surreptitiously working off their own inferior grade on to the shipper is also present. The using of the public storage rate in their own interest when buying and selling grain is an unfair and illegal discrimination which can always be employed to the injury of the general trade. We are of the opinion that an amendment to the law strictly prohibiting the proprietors of warehouses of Class A from being either directly or indirectly engaged in the grain business would be in the direction of sound public policy and good business morals.

SEC. 2. We have grave doubts of the propriety of the Board of Trade making regular any elevators that have a private elevator or cleaning-house connected with them, or under the same ownership or management. The paramount interest and constant endeavor of the owner of a public elevator should be to hold up and maintain the integrity of our standard grades of grain. When he is running a cleaning house his paramount and constant endeavor is to pass his own grain on the lowest line of the grade. If the quality of the grain in his house is to be kept up to a high standard it must be because the grain of other people is graded higher than is his own. It hardly seems proper that the support of the general market should be given to an individual whose constant, paramount interest is opposed to the good of the market.

SEC. 3. We find that it is the practice of the inspection department, where grain after being loaded out from an elevator is objected to by the shipper, and the objection is sustained by the supervising inspector or the committee of appeals, to permit this grain so degraded to be taken back into the elevator from which it came at the same grade at which it was originally and wrongfully inspected out. We think this practice is all wrong, and would recommend that the proper committee call the attention of the railroad and warehouse commissioners to it and endeavor to have it stopped. Grain so reduced in grade by the highest authority in the inspection department must either be tendered to some other shipper for what it is not, or else mixed with other grain of the same grade and so affect injuriously the owners of the same, both by depreciating their property and by hurting the credit of the house.

SEC. 4. We find that it is the practice of the inspection department to allow elevator proprietors to run grain back into the bins of the same grade when the quality has been objected to in the house by the shipper while running to the weighing bin. We believe that this matter should be decided at once by competent authority, and the shipper be compelled to accept if the property is up to grade, or the elevator compelled to make proper disposition of the grain if it is not.

SEC. 5. We find that at present the practice of the inspection department is to exercise no supervision over the grain while in the elevators, but simply to inspect *in* grain offered for warehousing, and to inspect *out* grain offered for shipment. We find that while the inspection was under the supervision of the board of trade, and in the earlier days of the State grain inspection, there was in every elevator what was called a distributing inspector, whose place was in the upper part of the house, who kept track of all the bins and their contents, who directed into which bin every car of grain should be run, and who directed when grain was to be shipped from which bins it was to be drawn, and who saw that the oldest grain in the house was the first shipped out. We are of the opinion that the supervisions exercised by such a distributing inspector would be exceedingly wholesome, and would recommend that the proper committee call the attention of the board of railroad and warehouse commissioners to the matter and try to get such a man put in every house.

SEC. 6. We find that some of the elevator proprietors who have been in the habit of putting the more desirable qualities of their own grain in bins marked "special" have not been equally careful to mark the receipts for the same "special" bin as required by law. We do not find, however, that the grain registrar takes any special cognizance of, or keeps any special track of, this "special bin" grain, or the receipts issued for it, although he could very easily and without extra expense do so. We would recommend that the proper committee call the attention of the board of railroad and warehouse commissioners to the matter and try to have the registrar directed to attend to it.

SEC. 7. We are of the opinion that there should be a specific rule of the board, making receipts for grain in "special bins" irregular for delivery on contracts. We see no reason why elevator proprietors who keep their property in shape to sell by sample, and so exact a premium for it (the special and proper function of a proprietor of a private house), should at the same time have the protection of a public elevator and the open market to hold them harmless against an unprofitable hedging sale.

SEC. 8. The fact that large quantities of grain are held here for storage purposes by elevator proprietors and commission merchants acting for them, and the further fact that our speculative trading having now gotten practically into but 4 months of the year, and thus tying up the grain for three or four months at a time, had naturally reduced the deliveries largely and brought it about that shippers can only get hold of grain to fill their orders by paying a premium for it. The inevitable result of such a state of facts has been that grain is now being held here too long for its own good or the good of the general trade. We would suggest that the directors carefully consider the propriety of adopting a rule limiting the age at which receipts should be regular for delivery on contracts.

SEC. 9. We have now in store here nearly 20,000,000 bushels of wheat, a large proportion of which has been in our elevators more than 12 months. We recommend that a committee of three competent judges, unconnected with the active grain trade, be appointed, who shall examine every bin of wheat in every regular elevator as soon as possible now, and again before the July and September deliveries, reporting to the board of directors, or the proper committee, any bin which they may find out of condition or tending that way, and that the directors instruct the elevator proprietors to at once move such grain out, and see that they do it.

H. F. DOUSMAN.

The WITNESS. I wish to introduce here, just in the form that it is in, rather than make any changes in it, a statement of the condition of the grain trade as presented to the members of the Fortieth general assembly of the State of Illinois in May, 1897. It is a review and a general statement of the conditions then surrounding the elevator business in Chicago, but it is too long to read you gentlemen in the short time I have.

(The statement referred to follows:)

MAY, 1897.

To the members of the Fortieth general assembly:

(Why we object to the passage of house bill 583, and senate bill 313.)

GENTLEMEN: The grain trade of Illinois and the farmer who produces our enormous crops are to-day fighting against the tyranny of the Chicago elevator monopoly, which from a fair and legitimate beginning has grown to such proportions and such influence as to threaten the very existence of all competition and to place a monopoly in a position to fix a price on the products of our farms.

And it is a broader question than the survival of the fittest among groups of business men or the interests of any one class. It concerns every merchant and every common carrier engaged in the great commerce of this State, and every farmer who contributes to make that commerce possible.

There is some misapprehension apparent outside of the grain trade as to the relations of elevators of Class "A" in Chicago to the general business of the country.

The warehousing of grain is only an incident in its transit from producers to consumer. Its natural and healthy function is in accepting for storage the overflow of the season of freest movement that the channels of commerce may not be clogged or obstructed and safely caring for the same while waiting demand.

Recognizing the importance and necessity of these warehouses, where the merchant and farmer could deposit their grain, the constitutional convention of

1870 in its wisdom created these public institutions by the adoption of article 13 of the constitution; following which, in response to the instructions of the constitution, the legislature of 1871 enacted our present railroad and warehouse law.

For almost 20 years this law was respected by the elevator owners; Chicago maintained her position as the "greatest grain market in the world;" thousands of buyers and sellers were brought together each day and a broad open market was the result; competition of buyers sustained prices, and that influence was felt the world over; for years Chicago presented the best market for the West to send her grain to, owing to the competition of buyers. But between 1887 and 1890 new forces began to be felt.

The interstate-commerce law had gone into effect, and before the close of 1890 nearly every railroad terminating in Chicago had some favored elevator system under its protection, the proprietors of which were given such profitable concessions as to enable them to control the grain business on that particular line of railroad.

The alliance between railroads and elevators has resulted in reaching out after millions of bushels of grain not naturally tributary to the Chicago market, and when gathered there, preventing it, by such tricks of trade as only the initiated are familiar with, from ever getting away again as long as storage can be collected on it. So that in Chicago the accumulation and storage of grain has come to be the chief end and aim of potential and dominating forces.

This policy has resulted in such congestion of grain there as to depress prices to the lowest point in history. For it is not the Chicago stock alone that that market has to carry. The very volume of the Chicago stocks invites dealers in every market in the world to make sales there against holdings elsewhere, which they would not dare to do but for abnormal accumulations brought and held there by unnatural means. Cargoes of wheat bought on European account in Australia, India, Russia, and Argentina, as well as stocks at all other points of accumulation, are sold against in Chicago, so that that market feels the weight of the entire world's surplus. This condition is only made possible by the enormous and unnatural hoard brought and retained there to satisfy the avarice of half a dozen corporations, the largest of which is owned in London.

By the rankest and most brazen manipulation they seek to control the price and movement of our commodities and force every buyer and every seller to their terms.

Two years ago they were selling spring wheat at 5 or 6 cents premium. Now they are selling winter wheat at a much greater premium (16 to 19 cents), while they have not been the owners of either. While they are nominally the custodians of the property they are able, in violation of the laws of the State, to set aside and sell at a premium millions of bushels every year, not owned by them but in their custody as warehousemen. Would any court permit a trustee of an estate to thus handle trust funds for his own advantage? This gain is not the legitimate profit of a public warehouseman. It belongs to the public who owns the grain. The lawful profit of the business of public warehousing has been attractive enough to create an enormous system of elevators in Chicago. If the business has been overdone it is due to the cupidity of those engaged in it. We cheerfully concede a fair return on capital employed in lawful operation of elevators, but will forever resist the use of its machinery for unjust or illegal practices.

They claim to be public benefactors, in that they bring grain in large amounts to Chicago that would otherwise go elsewhere. This is said to furnish employment to more banking capital and keep up the rate of interest and to give business to railroads and insurance companies. But we know that half a dozen firms and corporations have a monopoly of the business. They can not force grain there that is not naturally tributary, except on cut rates of freight denied the general public and forbidden by law. If our contention is sustained by the Supreme Court, each railroad will have a host of competing patrons instead of one; bankers will have a thousand active accounts instead of the small group of large borrowers who are now able to combine and dictate rates, while the short-rate card of insurance offices will again come into use. But the real question is not whether it may add to the traffic of railroads or increase the profits of banking or insurance capital, but whether it is right for public custodians of grain to be at the same time dealers in grain and enabled to select and set aside for their own purposes the best of what may come under their charge. No objection is made to all grain going to Chicago that can be legitimately brought there, but it is against public policy, and is not the legitimate function of a public warehouseman, operating under a license from the State, to be so engaged. It is the dual capacity that we object to and that is prohibited by law. In the spring of 1895 the quality of millions of bushels of grain stored in public warehouses was

aspersed by interested speculators. The board of trade, through its officers, sought to have such an investigation made as would refute the slander against grain stored in public warehouses and restore the confidence of buyers and holders of the property. But every elevator proprietor in Chicago joined in refusing permission to a committee of experts to make that necessary and wholesome examination. They knew the grain was above the average in quality and condition, but were willing to have it suspected in order to increase the carrying charges. The present monopoly is against everything and everybody but themselves.

A system that permits the proprietors of public elevators, directly or indirectly, to deal in the property of which they are custodians is essentially immoral. The temptation to reserve for themselves the best of the grade is one to which the law never contemplated that they should be subjected. Indeed the principal motive of the warehouse law was to prevent their ownership or control of grain in the public warehouses. Yet it is notorious that during the past few years the proprietors of elevators have had for sale and have sold millions of bushels of grain from public elevators by sample at a large premium, not one cent of which in equity belonged to them. The grain bought by elevator proprietors is promptly sold by them for some future delivery, so they become the custodians of other people's property, which, however, the public can only get on payment of such premium as the urgency of the demand may enable the elevators to exact. It is an unwelcome task to criticise the methods of any class of business men, but this is an occasion for plain speech and honest earnest effort to restore to the grain trade its vanishing glory and traditions. The elevator monopoly is a blight on legitimate business. The old-time open competition of thousands has been superseded by new conditions under which each railroad terminating in Chicago is practically controlled by a single buyer. Special rates are made to favored individuals, who have the further advantage of elevator control, so that rates charged to the public are rebated to themselves, thus enabling them to outbid or undersell all competitors. The charge of three-fourths of a cent per bushel for the first term of storage is retained only as a protection to elevator managers against the competition of legitimate dealers in grain. It is a charge that the public can not avoid, but which is ignored by them in their own transactions, thus forcing everyone to sell to or buy of them. The fact that this charge is not bona fide, but only a foil to competition, proves that it is unjust, and should be abolished. The charge of three-fourths of a cent per bushel for the transfer of grain from cars to vessels, a distance of perhaps 100 feet, is greater than the average rate of freight (by water), during the year 1895, from Chicago to Buffalo. The same grain is transferred on track by railroads from western to eastern cars for nothing.

The courts have decided that this system is contrary not only to law, but to "public policy." And now comes the elevator monopoly to the legislature at Springfield, asking to be protected by statute against the public and the courts.

They ask the passage of a bill the terms of which are entirely in keeping with their methods.

First. They ask the legislature to tell them that they must not discriminate in their own favor while transacting business, but they must be entirely unselfish.

Second. They ask that they be relieved of all responsibility as warehousemen, and that their elevators be put under the supervision of the State grain inspector department, at a cost to the farmers (whom they feel very friendly to at the present moment), of about \$90,000 per year.

The facts are that the bills (House bill 583 and Senate bill 313), if passed, would only lead to further litigation and give no relief or protection to producers or shippers, their sole and only object being to get into the statute something that could be construed so as to permit a continuance of these illegal practices.

Very truly yours,

JOHN HILL, Jr.,
President Grain Receivers and Shippers' Association of Chicago.

THE WITNESS. I desire to go on record as indorsing certain statements that have appeared in print but which I probably would better read so as to make them part of my testimony, rather than introduce the newspaper articles as they treat of other matters, and there are only certain portions of them that I want to take up.

(Reading from an article in the Chicago Chronicle of August 12, 1895:)

"Over 20 per cent of the whole storage capacity of the United States and Canada is located at Chicago. This includes all—public and private—as officially reported. Duluth has 27,200,000 bushel room; Minneapolis, 26,000,000; St. Louis, 13,350,000; Milwaukee, 5,430,000; Toledo, 7,200,000 bushels. These are the several competitors of Chicago for storage of the grain crops. These 6 points have a total capacity of 125,830,000 bushels, or about five-eighths of the whole. It is

assumed that the business of warehousing at all points is conducted under the laws of the respective States in which elevators are located. This is essential to a full understanding of this vast and important business. * * *

"It is assumed that it will not be denied that the elevator proprietors speculate in our markets. They are, in fact, large speculators nearly every day. They will not attempt to deny this. Proof is too readily obtainable. They own to-day fully 80 per cent of all the grain in store here, and this is not a new departure. They own quite regularly about the same per cent, day in and day out. Last year they sent buyers into the country and brought large amounts of grain here solely for the purpose of having the grain where they could place a tax upon it. Held at country points they could not impose this tax—make the grain earn them storage.

"The result of this move, while lucrative to themselves, cost the country very much more money than they themselves realized, for the reason it swelled the visible supplies to such an enormous extent—more especially wheat—that the world, being unacquainted with the real cause therefor, stood aghast and insisted on lower prices, arguing, quite naturally, that America had an enormous plethora, and therefore must, by virtue of the supposed fact, sell cheap, when the fact was, as fully borne out by subsequent events, this big visible was piled up wholly at the expense of the invisible. Old supplies of wheat were never smaller in America than they are to-day—wholly due to elevator men forcing to market the crops of 1893-94, so they might collect a tax thereon.

"It is but a fair assumption that wheat would not have sold at 50 cents per bushel in Chicago in 1894-95 had not this abnormal condition prevailed. Hence, it is quite fair to assert that the country lost a round lot of money by being compelled to accept for their wheat an abnormal low price, for the price they realized was certainly not based upon legitimate conditions. Granting that very low prices were possible by virtue of the bad times, it does not follow that the extremely low point reached, or anything very near it, would have prevailed had not the big visible stood in the way.

"But this was not the only unfavorable result of this move. It took from regular receivers at this point a large share of business which would have undoubtedly come to them under ordinary conditions. It practically threw the grain trade under the control of the elevator interests. They became not only the arbiters of prices, but by virtue of their wealth and ownership of grain they could and did widen out or contract the spreads between this and that month, just as they deemed it essential to their own pecuniary ends. This was done time and again, and will continue to be done so long as existing conditions prevail. Anyone at all conversant with the position will readily realize what a leverage this can be made by those who possess it.

"But this is not all. It is well known that there are certain months in which speculation centers. Beginning in the fall of 1894, for example, the seller May future was the favorite with the speculators. During March operators gradually changed to July; then it changed to September; now it is changing to December, and will probably go from there to May. Those who are long of these futures and are inclined to change over to a future month sell their September and buy, say (to-day), December. The difference in price is termed a 'spread.' The July-September spread was run up to 2½ early in July, not wholly of necessity by the elevator men, when real carrying charges were only 1½ cents. Then it will be remembered that on July 1 some 5,000,000 bushels of wheat were delivered on July contracts, mainly by the elevator proprietors. This was done for a purpose, or it is fair to assume it was. Large deliveries at any time do not tend to strengthen prices. If the market broke the wheat could be bought more cheaply. That is all there was to it.

"There was liquidation of the May future, of the July, and soon it will be September. The elevator men will buy back the September they sold against their July purchases and sell for December or May, whichever offers the better return. * * *

"The anomaly is also presented of a man depressing his own property and making money by the operation. Thus, if they so elected, the elevator men could sell a certain long option freely and break its price, and then buy a near one at a relative decline, replacing that sold at a profit. This has been done by somebody or other more times than one on the board of trade; and a person acquainted with the trade could easily reach a fair conclusion as to whom that somebody was. * * *

"Indeed, under present methods in vogue the opportunities of the elevator men for making money are simply enormous. And this is why the power should be curtailed. It is practically killing off business in Chicago. The outside world knows something of the strength of this great monopoly, and is not disposed to antagonize

it, preferring to go to some other market—some market not at the mercy of such a combination.”

(Reading from an article in the Chicago Chronicle of August 22, 1895:)

“One of the great weakening factors at present, and one which the trade has perhaps generally overlooked, is the attitude of the warehouse interest at Chicago in insisting on a premium on every bushel of wheat they sell. Yesterday they asked one half cent per bushel over the September option, which, counting the storage for the balance of August, is equivalent to a premium of three-quarter cents. These same tactics were carried out last year and undoubtedly not only had much to do with curtailing our exports, but also in depressing prices, for it practically kept the grain here and at accumulative centers. The argument, of course, is that in the presence of plenty buyers look upon these premium charges in the light of an extortion and very naturally refrain as far as possible from paying it.

“But this is not the worst phase. By this act exports were cut down and just so much money kept out of the country. It may be close to the truth now to suggest that gold exportation is due in a large measure to this cause. It is not human nature to submit to extortion, and we all know the foreign character is especially sensitive on this point. And this gold exportation does not only adversely affect wheat, but every commodity of our country; business in general, in fact. These are truths as developed by existing conditions, and are strong arguments why the elevator trust, which in reality is a blight on the trade, should be curtailed in its power.

“There is not the least question among those who are conversant with the facts that this octopus has already done the country great harm, has kept down the price of its productions, is to a certain extent responsible for the gold exports and their consequent deleterious effect on the commercial industries of America, and if permitted to continue in its present attitude must eventually do incalculable harm, if this has not already been accomplished. The law under which they were created admits of a fair recompense for labor and capital employed—all honest business men should ask.

“It may be claimed this premium is asked because the shipper wants grain in a specified elevator. Being a relatively small premium, this may be partially true of the present. Yet it will be remembered that within the last 12 months no less a premium than 2 to 3 cents for winter and 6 to 7 cents for spring was asked and received by elevator men. This they can not deny. It is on record, and can be clearly proven. And not only this, but at no time within a year has it been possible to buy a pound of wheat in the Chicago market except at a premium, either small or great, these elevator men owning as a rule all of 80 per cent of the stocks here.

“And there can result from this but one conclusion. So long as permitted to continue, so long must it be expected buyers will seek other markets. This means eventually another great accumulation of wheat in elevators at this point, another menace to prices, precisely the same as it was last year and the year before. It is a finger post standing in the road of prosperity or the enhancement of values. There is no doubt but if the market was allowed to assume a normal condition, if the price was permitted to remain on a par with futures, much more wheat could be sold to the foreigner. But he will not submit to be bled by a grinding monopoly. He wants a natural, not an unnatural market. Until he can have this America must be the loser.”

(Reading from an article in the Chicago Chronicle of September 6, 1895:)

“Profits in storage. The Chicago storage rate is one-fourth cent per bushel for each ten days. For all the empty bins this means \$145,000 for each ten days, or nearly \$450,000 per month. For one year the total would amount to the respectable sum of \$5,300,000. This explains the anxiety of the Chicago elevator trust, in combination with the Northwestern elevator interests, to depress wheat prices, to the end that they may earn money with their idle warehouse room and profit by buying wheat for future delivery.”

(Reading from an article in the Chicago Chronicle of September 7, 1895:)

“Unfortunately for the country the wheat trade is practically in the hands and under the control of a giant monopoly, from which it appears impossible to cut loose. The elevator interest is that monopoly. It is manipulating the market to its own aggrandizement, and this manipulation is seriously crippling the trade, if not killing it. By its actions the price is being held down and the producers, therefore, despoiled of money that justly belongs to them. They control the market to such an extent that shippers are absolutely prevented from filling legitimate orders. There is practically no wheat for sale in Chicago, though there is in store here some 14,000,000 bushels, and all owned by the elevator interest. A shipper yesterday was compelled to pay December prices for a small lot, or a

premium of over 1½ cents per bushel. This is driving away from Chicago this desirable trade. And not only this, the knowledge of the existence of this octopus is undoubtedly the reason why our speculative business has fallen from an immense one to an almost normal one."

The WITNESS. I want to introduce a letter to show that the grain dealers of Illinois are opposed to this state of affairs.

(Letter referred to follows:)

[Office of secretary Illinois Grain Dealers' Association. B. S. Tyler, secretary.]

DECATUR, ILL., April 24, 1897.

DEAR SIR: We again call your attention to House bill No. 583 and Senate bill No. 313 now before the legislature at Springfield. These bills were introduced and are being pushed by the grain elevator trust, the Armour Elevator Company being at the head of the list.

These public elevators, as you know, were cited to appear before Judge Tuley for buying grain, when the warehouse laws had always held that they could not act in the dual capacity of public warehousemen and grain dealers at the same time. Judge Tuley heard the evidence presented by both sides, and on December 22, 1896, decreed that they have no right to deal in grain. They have taken the case to the supreme court of Illinois. They know that the higher court will sustain Judge Tuley's just decision. They override all courts and all justice, and are attempting the passage of the bills referred to, which if passed will give them the right to deal in grain, thereby giving them a monopoly of the trade, and robbing grain producers and grain buyers and millers throughout the grain territory of the United States.

It behooves every grain dealer to see to it that this damnable bill is defeated. The elevators have a limitless amount of grease to use if need be to pass this measure. It means millions of gain to them, and an equal loss to grain men and producers.

The grain men must be up and doing. Our association has selected you with others in your senatorial district to see your representatives and senator, and enter a most emphatic protest against the passage of this nefarious bill.

You are urged to be at Springfield on Thursday, April 29. You can not spend your money and time more profitably and in a better cause than to be at Springfield on that day and remainder of the week. See others and urge them to go with you. Report at the Leland or St. Nicholas. If it is absolutely impossible for you to go be sure and send some other influential person in your place, and write me whom you have selected. Come if you can.

Yours, truly,

B. S. TYLER,
Secretary.

The WITNESS. In order to show the abuses that grow out of the present system here, I wish to introduce certain parts of a statement made by me in print on the 17th day of July, 1899.

(So much of statement as was introduced by witness follows:)

"On May 1, 1899, there was delivered to members of the board of trade by Armour & Co. fraudulent warehouse receipts to the extent of 1,200,000 bushels of No. 2 spring wheat.

"The magnitude of the swindle exposed it by attracting attention of members to the number of receipts that were just regular on delivery day.

"The directory promptly investigated the matter, and when the facts were placed before them they almost unanimously voted the entire Armour system of elevators irregular.

"As not only our rules had been violated, but also a crime punishable by imprisonment in the penitentiary for from 1 to 10 years committed, the directory having the good name and dignity of the association to protect, caused a committee to investigate the members of the board of trade responsible for this wholesale robbery.

"The committee, after due investigation, filed charges with the directory against Philip D. Armour, Philip D. Armour, jr., J. Ogden Armour, and A. I. Valentine.

"At the trial before the directory the facts were all admitted, but the three Armours denied knowledge of the issuing of the receipts, and Valentine, under oath, exonerated them and assumed all the responsibility.

"The directors acquitted the Armours and convicted Valentine, and fixed the penalty at 20 years' suspension from the privileges of the board.

"The developments during the trial and investigation only aggravated the case. It was shown that warehouse receipts to the enormous total of about 12,000,000 bushels had been manipulated in this way during 1893-1895, and 1896; beginning with the Cudahy wheat deal in 1893. The public and members of the board had been systematically plundered for 3 years; the market depressed by delivery of undesirable warehouse receipts, which expired the day they were delivered, and were dated months after the grain had been received in the elevator. Mr. Valentine stated under oath that he manipulated the dates, or 1,200,000 bushels wheat receipts, included in the charges, so that they would expire for shipping on May 6, thereby inducing shippers to take the grain out of store."

The WITNESS. I will also introduce a letter here of a Chicago house, showing another of the abuses growing out of the present system, and how it affects people.

(Said letter follows:)

[Nash-Wright Company, commission merchants; S. H. Greeley, 515-519 Rialto Building, Chicago.]

CHICAGO, June 2, 1897.

DEAR SIR: To illustrate the methods employed by public warehousemen here toward country elevator proprietors, we want to cite a case which recently occurred in our city.

A certain public warehouseman, operating both public warehouses and cleaning houses, received 50 cars of corn on one of the roads entering Chicago. The corn was duly inspected by the proper authorities, and passed the contract grades, either 2 or 3 yellow.

This public warehouseman, being himself a grain dealer, called reinspection on this corn, and asked that the chief inspector of grain change the shipments from 2 and 2 yellow to 3 and 4 corn, which, if accomplished, would lessen the market value of the corn from 2 to 5 cents per bushel.

The cars were reinspected as requested, and we overheard the conversation in which the supervising inspector of grain told the representatives of this public warehouseman that that corn was certainly of the best quality which comes to this market, and that he did not want to be sent out in the future to lessen the grades of any such fine quality of corn as that which he inspected.

It is quite proper to infer that this corn was bought from shippers in the country, and it was the aim and intention of this elevator proprietor to endeavor to injure the interests of the shipper, thus being able to secure the corn at heavy discounts in price.

It would be an easy matter, had this corn been changed to the poorer grades, to run it into the cleaning house, inspect it out for the grade to be made 2 corn at the out inspection, and thus secure the 2 corn market for the very same corn which he might have bought as 3 or 4 had his scheme for changing grade been successful.

This circumstance only goes to show how some people might attempt to thrive on the misfortunes of others with whom they trade.

NASH-WRIGHT COMPANY.

Q. (By Mr. A. L. HARRIS.) Have you anything further to offer?—A. Nothing that is not contained in that printed matter; but I will say that, in my opinion, the present system of handling grain in Chicago, consolidating the business of different roads or of one road into the hands of one buyer, is a great detriment, not only to the market, but also to the country through which the road runs.

Q. In what way does it hurt the country through which the line runs?—A. In this way: Formerly we would have 2 or 3 or 4 grain buyers, and the tendency now is to have one grain buyer, and he a cheap man on \$40 or \$50 a month, representing some big house here, while the other men were permanent, with families, and it would increase the business of the town, and it would be necessary to bring goods into the town for them, and they would buy their goods at home to a certain extent and make business for that town; while in the case of the system that is growing up now a cheap fellow like a telegraph operator will go in and do that business that formerly was done by one of the prominent business men in the town, or 3 or 4 of them.

Q. Do you mean to say that it destroys competition?—A. It destroys competition, undoubtedly. Mr. Hanley here stated that when certain conditions exist they shut down their elevators—do not run; competition is destroyed; that is what has happened. The competition is destroyed and one elevator shuts up. The town is affected to that extent that one man dictates the price of the grain.

Q. To what extent does this condition prevail outside of the city of Chicago?—A. It is a growing condition. The original intention of some lines of road was to

make the condition immediate, but it failed. The people who went into the grain business as the result of the change in policy of the railroads were not the grain men; they had not had this experience. For instance, Charles Counselman jumped into the grain business and tried to run two or three hundred stations. He was not a grain man, and the consequence was that he was glad to sell out a good many of those stations, and then he began to gradually establish the stations again, and that is the case on the St. Paul road now. The system has grown up gradually. A certain concern which to all appearances represents Armour & Company, but under a different name, is gradually taking up the elevators, buying out the grain dealers, and going into business under the name of the Neola Elevator Company, and in the Northwest you will find when you go up there that whole lines of roads—every town on the line of a road has a certain agent or buyer—the same system there; not, in fact, like ours, because our market is different from any of the other markets in the fact that we handle more of other products than wheat. In the Northwest they are confined more largely to wheat. Of course Duluth is getting so that it handles a good deal of grain now in that direction.

Q. (By Mr. J. C. HANLEY.) I would like to ask Mr. Hill, if, in his experience as a grain man, the question of mixing grain is an important matter in the grain business?—A. So important that no terminal elevator exists here to-day, with possibly one or two exceptions, that has not a mixing house connected with it. Armour's mixing houses are larger than his public houses to-day.

Q. (By Mr. A. L. HARRIS.) What do you mean by a "mixing house?"—A. Where they manipulate the grain—take the poor grades and mix them together to make them represent a higher grade than the poorest grade they have.

Q. (By Mr. J. C. HANLEY.) Now, in the reception of those grades, there is a wide range between what you would call the highest of a grade and the lowest—what we call the line grade—above and below that point?—A. Yes.

Q. How do they dispose of the premium on the high grades, keep within the line, and still dispose of it as No. 1?—A. The grain is sold, if it is a high grade, by sample, and brings a premium. It is then run through the cleaning house and the lower grade of grain, not the lower quality of the same grade, but a lower grade entirely—

Q. (Interrupting.) No. 2 or No. 3, for instance, would go in with No. 1?—A. Yes; is mixed in with it, and that high-grade grain is brought down to the lowest point, and it will go into the same grade that it went into before. Our market is on the lowest grade. That is one of the great detriments to the market. If a man buys No. 2 wheat in Chicago, or No. 1 Northern wheat in Chicago, he buys it with the expectation of getting the very poorest wheat that will grade No. 1 in Chicago.

Q. (By Mr. A. L. HARRIS.) Does that fix the price of wheat injuriously to the farmer?—A. Certainly. Speculation to a great extent fixes the price of the grain. It can not help it. It is such an enormous speculation; and if the speculator dealing in the lowest of that grade, the poorest quality of that grade, takes it and pays for it and goes to the elevator to get it he can not expect to get any better than the very poorest wheat that will come in that grade, because he knows it has passed through the cleaning house, through the hands of the elevator men who would not deliver him any better grade than they have to. They are "skinning" the grades down; they are constantly manipulating them. If they find a car that is a poorer grade that will bring, say, 10 cents a bushel less, they will mix the two grades.

Q. (By Mr. J. C. HANLEY.) Does not that affect the price at the terminal points?—A. It certainly does, because we do not trade on grades, but we trade by sample; and the sample grade which goes for export is sold at a premium over the grade that is held in store here and is the speculative grade.

Q. But no farmer gets the benefit of the premium on the grade?—A. No.

Q. And the only one who gets that is the man who mixes the grain and has it for sale?—A. Yes.

Q. To what extent does a premium exist upon those different grades?—A. Oh, it varies so much you can not estimate very closely. It is from 1 cent to 3 or 4 cents.

WASHINGTON, D. C., September 23, 1899.

TESTIMONY OF MR. ELLIOT B. NORRIS,*Fruit grower and dealer, Sodus, N. Y.*

The commission met at 10.45 a. m., Vice-Chairman Phillips presiding.

Mr. Elliott B. Norris, being duly sworn, testified as follows, being examined on the topical plan of inquiry on agriculture:

Q. (By Mr. A. L. HARRIS.) You may please state your name, residence, and occupation.—A. My name is Elliott B. Norris, Sodus, N. Y.; my occupation is that of a farmer and fruit grower and dealer.

Q. You may state whether you are connected in any way with a farmers' organization. And if so, in what way?—A. I am; I am now the master of the State grange of the State of New York.

Q. How long have you held that position?—A. About 18 months.

Q. As master of the State grange, have you traveled over the State?—A. I have, to quite a large extent. I have not been in all counties. I have probably been in some 20 or 25 counties.

Q. Have you local granges in almost all of the counties of the State?—A. We have now established granges in all counties of the State excepting about 6.

Q. Your travels through the State have given you a good knowledge of agricultural conditions there?—A. Somewhat.

Q. You may state, if you please, whether the laborers employed in agriculture have increased in the last 20 years. And if not, why not?—A. In my judgment, the agricultural laborers during the past 20 years have increased somewhat. There was a period, from 1890, when there was a tendency to decrease, on account of the large call in the cities for laborers, the prices paid at that time being quite attractive and resulting in drawing quite a goodly number from the farms; but they soon discovered that it was a bubble, and they have for the past 2 years been coming back gradually to the farms; so I should think that there was an increase, or a tendency toward increase at the present time, of farm laborers.

Q. What is the difference, social and moral, between the farm laborers now compared with former years?—A. Very much better. A farm laborer to-day has very many more privileges than 40 years ago, and a large majority of them are better informed in our section of the country than they were 25 or 30 years ago; and their condition financially is better. Any man that works on the farm now—if he is inclined to be industrious and sober—there is no reason why he is not making a nice living and doing fully as well as the man employing him.

Q. What effect, if any, has improved machinery to-day upon the demand for labor upon the farm?—A. I do not think that it has decreased that demand. In fact it has opened new avenues of industry on the farm that have given employment to the people that were formerly engaged in doing hand labor; it has opened up new industries to employ them, so that it has not injured, but has rather benefited, in my judgment, in our country, the condition of labor.

Q. Are they regularly employed?—A. They are regularly employed there 8 or 10 months of the year on farms as a rule, and the majority of them are employed the most of the 12 months—that care to be. There are occasionally some men, single men, that hire out and work 8 or 9 months that are quite inclined, after their time is up, to take things a little easy. They have homes, perhaps, where they congregate together, the boys and girls, and have a pretty good time for 2 or 3 months; but those who wish to be engaged can find labor pretty much the 12 months at fair prices.

Q. Have you any transient labor, especially in the busy seasons?—A. We have, but not as much as we used to have years ago. We have in certain lines, but we do not have as much transient labor to perform the general harvest work that we used to have in former years, because it is largely done by machinery; but we have in our State large new industries that are starting—fruit growing and the harvesting of berries and small fruits—and when it comes down to the fall we have our apple crops and all those. It takes a good deal of transient labor; we have to employ quite largely outside; so that I think that there perhaps has been an increase rather than a decrease in transient labor in our State, especially in our section of the country.

Q. What are the daily hours of agricultural labor in your section?—A. It is now about 10 hours; that is the established rule on most farms now.

Q. What is the average number of days they are employed in a year?—A. That is rather a difficult question to answer, but I should say, from my observation, from 190 to 200.

Q. Do you discover the tendency of the agricultural laborer to seek other employment?—A. Well, as I said at the beginning, from the years 1890 to 1895 there seemed to be a tendency of the best and brightest men we had in our community to go off into other pursuits, either into railroading or moving into the cities where they became clerks, etc.; but during the past 2 or 3 years, especially the past 2 years, there is a general returning to the farm; there seems to be quite a tendency to go back on the farms again; so that we are continually getting better men now than we did 4 or 5 years ago. For that reason we are getting a better class of people on the farms. There was one time there that it was a pretty difficult matter to get what we called good, first-class men that we could depend upon. We had to take up with, well, the "rag-tag" of all creation that would come to the farms. Some of the men were not good for anything else, and they would generally hire out to the farmers, and we were obliged to take up with that kind of help; but during the past 2 years there has been a better class of labor coming to the farms—people more intelligent.

Q. How frequently do you pay your farm help?—A. A great deal of our help is hired now by the day. They are paid so much per day, and they are paid at the end of every month. Some people continue with the old practice of hiring by the 8 or 9 months' system, and paying their laborers, settling up with them, at the end of 8 or 9 months, but the most progressive farmers with us now are hiring and paying help every month, and hire them largely by such a rate per day.

Q. About what is the average paid?—A. The average paid by the month, where they are hired by the month, is from \$18 to \$20.

Q. (By Mr. RATCHFORD.) Is that by the day?—A. That is by the month; and \$1 per day is the universal price, and the man boards himself.

Q. (Mr. A. L. HARRIS.) What is the pay where the farmer boards the man—where he lives in the family?—A. From about \$17 to \$18 a month—the very best men; some of them get as high as \$18 per month.

Q. What does that include?—A. For a single man that includes as a rule only their board and lodging. Their washing is done outside.

Q. Do you pay in cash?—A. Farm laborers, especially those single men, are all paid in cash. Men that have families, some of them, are paid off from the produce of the farm, such as flour and feed for their cow, if they keep one, or they keep a cow for them at so much per week. There are two or three systems of hiring. Where a man is hired that has a house, some farmers pay him so much and he pays for all privileges; pays for his house and his fuel, and if he keeps a cow or horse, he pays so much per week for them, and pays the market price for all produce that he takes from the farm that he wishes to buy from the farmer. Another plan is that the farmer furnishes the tenant with all privileges at such a rate per month; that is, for men who are tenants. Which plan is adopted the most extensively I am not prepared to say, but I judge the plan that they are getting largely into now, of paying a man so much and he pays for all privileges, is found to be most satisfactory. In our farm operations we have a system of time cards. We have a foreman for each farm, and at the end of the month every man is charged up with what work he does and for every horse on the farm, so that at the end of the month we can tell what every man has been doing and what we have paid him and what every horse on the farm has done, so we have a correct account of our expenses. At the end of each month we can tell just what is charged up to each crop. Whatever the crop be, whether apples or grapes, or wheat, oats or barley, or anything of that kind, it is all charged to that particular crop, the amount of work that is done, and at the end of the year if we find out that a certain crop has not been paying, we pretty near quit doing that kind of business. My idea is that the nearer the farmers come to a correct system of accounting, or knowing what they are doing, the better they will come out, and nearer they will know what they are doing every year. As a general rule, the farmer in our country knows he puts so much money into his business, and at the end of the year if he has a certain amount in his pocket he has made something, and if not he does not know where it has gone to.

Q. What privileges go with the tenant's house?—A. Not any, except the rent of the house; and occasionally farmers that have it furnish the firewood—give them the wood for their family and a team to draw it; and that is all; but as a rule they just simply furnish the house.

Q. (By Mr. PHILLIPS.) In your State, then, they burn wood chiefly? Do they burn coal?—A. Not so extensively. Most every farmer has wood; but that is fast being done away with; and, as I stated a little while ago, they are coming to the plan where a man is paying for everything he has, and he pays for every privilege. We find it gives better satisfaction. A tenant sometimes will think he is not getting something quite good enough, and there is a little difference in paying for it; it may cause a little friction, but if he buys his own stuff and pays his own money he knows what he is getting. We think that is the best plan, on the whole.

Q. (By Mr. A. L. HARRIS.) Is this custom generally practiced in different portions of the State, or is it only in your locality?—A. I think it is, as a rule, where a man has a tenant. Of course, I am speaking now about men that are hired out for steady work, understand, on farms during the season. I am not speaking particularly about day men. Day men all pay for their goods—their house rent and everything they get from the farmer; they pay him for it. It is only practiced where men are hired by the month.

Q. Is the system of renting land to a tenant practiced in your State?—A. It is somewhat. I think perhaps at one time it was practiced rather more than it is to-day, although there is quite a good deal of that done now. A man rents a farm for so much, and he has the entire control of it under a contract, agreeing to do certain things; but I think they are more extensively working farms on shares now, and that is a notable fact; that shows there is a tendency to come back on the farm. I noticed particularly that during the past year a great many people who have been living in towns and cities have come out and rented farms, or worked farms on shares—people who had abandoned that and gone into something else 4 or 5 years ago. Whether they are going to make any more money or not is a question I can not answer, but there seems to be at least a tendency to try it again to see.

Q. Have you a system of crop sharing among your tenants?—A. No further than the working of farms on shares. A man furnishes one-half of the seed and does all the work, and divides the product. We have no other plan of sharing.

Q. Is the division equal?—A. The divisions, as a rule, are equal. In some cases, where a farm is worked and the owner furnishes the teams and all seeds, the tenant has one-third. When a man does the work and furnishes his own team, with the exception perhaps of certain things, like paying the taxes, or furnishing some of the small seeds, perhaps the farmer agrees to pay a little more than one-half of it, under certain conditions, as if they run an evaporator. We have a large evaporator industry in our section of the country in the fruit business, and if a man does evaporating of the fruit, furnishes help, etc., a farmer generally pays him a little bonus for doing that extra work.

Q. Does that apply to different agricultural industries as well as fruit raising?—A. It applies just about the same.

Q. No particular difference?—A. No.

Q. (By Mr. FARQUHAR.) How extensively is evaporating carried on in New York in the fruit business?—A. It is carried on very extensively, indeed. It probably brings into Wayne County more dollars than any other industry.

Q. Where do you find your market for evaporated fruit?—A. All over the world.

Q. In what kind of packages is it sent usually?—A. The packages, as a rule, are put up in 50 pound pine cases, and some are put up in halves, 25 pounds, and others are put up in 2 and 5 pound paper packages. That is not very extensively done. The manufacturer puts them up in 50-pound cases.

Q. (By Mr. PHILLIPS.) What kind of fruit is this?—A. It takes all classes. Some farmers sell their orchards right out; the whole crop is evaporated, taking firsts, seconds, and everything.

Q. Do you raise apples and peaches both, or chiefly apples?—A. Chiefly apples. Peaches are not evaporated much in our business.

Q. (By Mr. FARQUHAR.) Does this evaporated fruit take the place of fresh fruits in the principal cities?—A. Yes.

Q. Commonly used in hotels, restaurants, etc.?—A. Yes; and in a great many private families they use evaporated apples.

Q. How long and how far will they stand transportation?—A. It will hold, if it is kept from the air and kept under proper conditions—it should be put in cold storage where it is kept over—we have had it keep as long as 4 years and come out perfectly good.

Q. Does it pay better to evaporate a fruit crop than to sell it?—A. Some farmers like to get rid of doing the work, and so they sell their apples right out and out. They do not have any trouble with them. They simply agree to deliver their product to the evaporator, or to give the man the privilege of barreling a portion of that fruit, as they see fit; and they do not care to do anything further than pick the apples off the trees and put them on the ground for the parties, and the other people barrel them. It is becoming very customary in our section of the country for the buyers to do their own packing. They have a more uniform way of packing.

Q. (By Mr. PHILLIPS.) Do you take any liens on growing crops? Is there any lien system in your State?—A. Well, not to any great extent. It is generally found that this taking a lien on a man's crop rather discourages him, does not

give him any show; and even if the grower is what the world terms "hard up," they do not adopt that system very much with him, because it discourages the man on the go in.

Q. (By Mr. A. L. HARRIS.) Have you any people from foreign countries in your part of the State?—A. We have.

Q. What nationalities predominate?—A. Germans and Hollanders.

Q. You may state, if you will, what is the character of your foreign immigrants.—A. The character of the foreign immigrants that have come to our country has been very good, indeed, and the Germans, as a rule, are quite intelligent, have had educational advantages, more so than the Hollanders; and I am frank to say to you gentlemen that that foreign element controls to-day, I think, the majority of the lands of Wayne County. They own them. They seem to be born agriculturalists; they get right into that from the time they get there, and if they go to some farmer and stay with him for about 10 years they generally buy the farm, and the farmer moves off and goes to town and takes things easy. That is about the way the thing is going with us. And they make first-class citizens, too; they make good citizens.

Q. Please state why this change takes place, if you know.—A. Well, it takes place in this way; that the Yankees, as a rule—we call them Yankees—Americans—have an idea that speculation is more congenial to their minds than the work of a farm, so they go into speculation and leave the Germans and Hollanders to do the work, and the first thing they know they have speculated out and the German owns the farm, and the fellow moves to town and lives from hand to mouth, and the Dutchman survives. That is about the way it goes; simply because the American has, perhaps, a family of children who think that they are too nice to work with their hands. They must do something else—must either teach school or jump behind a counter, or do something of that kind. They skin out and leave the farming to the farmer. The old man is left to do it himself. Of course, the German stays there. He is a mighty good fellow and does the thing all right, and by and by the farmer sells the farm to the German. The Germans all work—the boys, the girls, and everybody—and the consequence is that by and by he buys the farm.

Q. Is there any tendency on the part of this foreign element to colonize or get together and preserve their language and habits?—A. Well, I will say that they are quite clannish, especially the Hollanders; I think they are a little more so than the Germans. They are quite clannish in some things and they are very tenacious about some things; and generally, where a leading Hollander or German, especially a Hollander, buys a farm, or if he has anything to be bought or sold, there is another Dutchman ready to buy that, if possible, of this Dutchman, if he is a sort of leader among them. So there is quite a tendency to get them in little neighborhoods. Our county seat, Lyons, is controlled by the Germans; both in the town and in the village the Germans have the controlling power, politically and every other way.

Q. (By Mr. PHILLIPS.) The county as well as the town?—A. No; just the town. Yes, I would venture to say that if you had the Hollanders and the Germans all voting one way they would hold the balance of power in the county to-day.

Q. (By Mr. A. L. HARRIS.) What effect, if any, does this have upon the agricultural industry?—A. It does not affect it any way detrimentally. They are a good class of farmers. They till their soil well, and, in fact, they are better farmers, as a rule, than the Americans. They are more thorough; they have been brought up in a country where tillage was the first step that was instilled into them, and they will take up these new lands. They are great fellows, especially the Hollanders, to come into our country and pick up what we call our muck lands, our low ground, ditch them out, and put them in shape. They are great onion raisers; they produce a large amount of onions and celery, and all those things; and they are reclaiming those lands; so that, I think, upon the whole, they are a better class of farmers than the Americans. They are really bringing as much wealth into the State as the Americans are because they are thorough in what they do; but, of course, I do not say this applies to all of them. They have black sheep as well as others.

Q. Would you encourage or discourage foreign immigration?—A. As far as it affects agriculture in our State, I would rather encourage than discourage the class of people that we have had. We do not take very much to the Italians and that class of people. We are not troubled with the Italians as farm laborers in our county at all. They follow the railroads, and we do not see very much of them unless there is some job that they tarry on a few weeks; but as farm laborers there are hardly any Italians in our section of the country. I am told that in some sections of the country where they are growing sugar beets quite largely,

down near Rome, they hire some of these Italians that live along the canal, that calculate to make their livelihood on the canal and railroads. They do employ some of them, and their children and women, to weed out their sugar beet. That is all I know of.

Q. Have you any suggestions to make as to the regulation of foreign immigration?—A. Well, speaking for my own State, I do not know as I have anything to offer. I think we are pretty well satisfied. Of course, there are other sections of the country that I can not speak for.

Q. Have you any colored labor?—A. Very little. We only had one settlement. Very few colored people have come into our locality; and, in fact, in the State there are but very few colored people. Right near my town there was the old Fitzhugh estate. When they freed their slaves they gave them a certain amount of land; I think there must be a section there of about 1,000 acres which was left to those people in trust. When they become extinct, if they do, it goes back to the heirs or this estate, in the future, sometime. Well, those people have not progressed at all; they have had all the opportunities of the foreigners; they have had this land given to them, and still they live there right in those little hovels that they have lived in ever since I was a boy, and there is no progress whatever, and they are decreasing rather than increasing, and they are an element that amounts to but very little.

Q. What have you to say in regard to the sufficiency of your public-school facilities?—A. I think that our public-school facilities are very good, and they are growing better. The requirements of our common-school teachers—that is, the qualifications—are becoming more exacting every year. The teachers that taught school several years ago—taught a common school—to-day can not get a certificate; they have not the proper qualifications to get a certificate. They are fast putting into our common schools people who have better qualifications. Regarding the system of our common-school teaching, comparing the old with the new, as far as my observation goes, I am not dead in love with the system of teaching, or the way some of them are teaching nowadays. I believe that the best way is to do as we used to—begin with the fundamental part and teach reading, writing, and spelling, and teach people the rules, and to know how it is done. It seems to me they retained them better. Perhaps I am a little old-fashioned, but I am sure that our old plans of teaching, as far as reading, writing, and spelling are concerned, were more proficient in those days than they are now. I judge that somewhat by my own children and by others that I see. They seem to be more deficient in spelling. It does not seem to me as though we have as good spellers now as we used to have.

Q. You consider, then, the public-school curriculum, as now established in your State, sufficient for agricultural purposes?—A. Yes; I do.

Q. Have you any technical education in agriculture?—A. We have some courses at Cornell every year, agricultural courses, short courses, that are of very much benefit. Many of our young men are getting the benefit of those agricultural courses, and they have been a great benefit to them. Particularly the dairy branch, or fruit growing, or practical agriculture, short courses of 10 weeks or 20 weeks, which some of our young men are taking up, and which have been a very good thing, I think.

Q. After getting that education are they content to go back to the farm?—A. Some of them are and some of them are not. As a rule, I think they are. It makes a good deal of difference the way a young man is made up about that. I think if you attempt to make farmers of some young men they would be complete failures, because they never were born that way. I think every man should be allowed his natural inclination. If he has an eye for mechanics he ought to be instructed and take a particular course in that line; and if he likes farming, why let him be a farmer. A man will not be a success in anything that he does not like; he must be in love with his business, I do not care what it is; that is my experience.

Q. (By Mr. PHILLIPS.) I would like to recur to the question of this colored labor. About when were those colored people freed in your State?—A. I guess it was nearly 50 years ago. It was the time the slaves were freed in New York State. I do not remember the year.

Q. How many families were there in this colony?—A. There must have been at the time they were freed in the neighborhood of 150 or 200 of them.

Q. Was the land divided up and parceled out among them?—A. Yes. This Fitzhugh owned in there probably 3,000 or 4,000 acres of land; took it up at an early day. The heirs of the family still live on the old estate, and they are scattered, of course, all over. The old ones, of course, are all dead.

Q. How many are there in this colony now?—A. Well, I should have to guess at that. I should think 50 or 75 of them, maybe more.

Q. Decreased nearly one-half?—A. They have decreased fully one-half, and of course as fast as they go out the property is tenanted by white people.

Q. Have they had any educational facilities?—A. Just as good as any of the other people there.

Q. Go to school with the white people?—A. Had the chance to go to school if they so desired.

Q. Do they have a colored school?—A. No; they could go right along with the white people if they wanted to. There is no objection to it.

Q. Have quite a considerable portion of them gone away?—A. Well, some of them have gone away; quite a good many have gone out, but they have simply run out. That is about the way of it. Of course there are but very few of them.

Q. Then this colony of colored people has not been a success, though they have had a good opportunity?—A. There is not a single good farmer in the whole lot.

Q. The land was equally as good as other lands?—A. They have had good land parceled out to them, and their chances were equally as good as any other American or foreigner that might come in there, but they simply have been an indolent class of people and have not tried to do anything.

Q. This is in your own county?—A. It is right in my own town. I know about this. They do not seem to have any inclination for any education whatever.

Q. (By Mr. A. L. HARRIS.) Please state, if you will, the comparative earnings of capital now, as compared with former years, employed in agriculture.—A. I do not think that there is as much money made upon the capital employed in agricultural pursuits as there was 30 or 40 years ago, for the reason that agricultural lands have depreciated in value and the prices of agricultural products have likewise decreased. And, furthermore, when the soil was in its virgin state it produced from 30 to 40 bushels of wheat per acre in our section of the State without any great amount of fitting, without any fertilizer; but to-day, with a high state of cultivation and the use of fertilizer, the average number of bushels per acre has decreased to about 25. Even this year, when we had a good wheat year, our average would not exceed 25 bushels per acre; and about the same thing might be said of barley and oats. Our section of the State especially was peculiarly adapted to the growing of barley. We used years ago to consider that our barley and our apples were the crops that we got our money out of. But now barley has just simply been wiped right out. In those days it was considered a pretty low price if you did not get 70 to 75 cents for barley, and oftentimes we got a dollar or better; and the price got reduced down to about 30 or 35 cents, and people practically stopped raising it, so that the best barley section of our State to-day is practically out of the growth of the crop entirely. I think it would be fair to say, in my town where I live, that there is not 1,000 bushels of barley grown this season, where they used to produce 25,000 to 40,000 bushels in the town.

Q. What is the cause of that decrease?—A. The low price. It did not pay to raise the barley. And, more than that, we used to have a very large malting industry. In our county particularly there were several very large malt houses; and when this trust system began to take hold they just closed up all but one pretty much and began to buy Western barley, and our people stopped raising it. I suppose I may say that the system of adulterating malt, using other products in the place of barley malt to make beer of, has had another large effect in decreasing the raising of barley.

Q. What effect, if any, has the barley imported from Canada had upon the prices?—A. Not any. We never felt any visible effect from that, because the duty that we have to pay on Canada barley practically wipes that out. The claim of the malsters has been that Canada barley made a little lighter malt and a little bit more of it, as their barley has a little finer shell than ours. Of course that was the plea the malsters always made in order that they might buy some of our best barley at a little less than the Canada price. That was used as an argument for several years. But the Canada barley has never affected us in any manner whatever. It has never been in it. It has been the adulteration of the malt products in beer that has destroyed the barley growing business in our country, I think.

Q. What is the earning of capital invested in agriculture compared with capital invested in other industries?—A. Oh, it is not to be compared at the present time. It is not a quarter—the earning of agriculture as compared with banks or mercantile pursuits—at the present time. I am not going to say that this condition has prevailed for the last ten years, because there has been a large depreciation, as you know, in all mercantile and manufacturing interests; but at the

present time there is a big boom in those things, and there is not a very material boom in agriculture.

Q. Well, speaking of the average; speaking of the state of investments also, taking into consideration the risk.—A. Well, from the amount of money employed in agriculture as compared with other business, say for the last 20 years, perhaps as many have managed to live as there are in any other business. But we have not seen any particular advance in prices in agriculture, unless there be a shortage. Of course whenever there is a shortage of a crop people can get prices; when they have too much they must find a market to get rid of it.

Q. What have you to say about the taxation of agricultural property?—A. I think that landed property is paying an unfair rate or taxation as compared with other property to-day. I mean to say by that that all landed property, real estate, is visible; the assessors get it; but if a man has money he covers it up in bonds and other things, and it slips away, and they do not get it. I think real estate is paying an unjust proportion of the taxation in this particular State as compared with personal property, and the fault is largely because the system does not reach personal property.

Q. Is it exempt by law?—A. No, not exempt.

Q. How do they get clear on the listing of their property?—A. When the assessor comes around to a man who owns Government bonds or something else he slips that around; manages to get out of paying on that line usually.

Q. Do you tax notes, stocks, and securities outside of Government bonds?—A. We do if we can find them. If a man has any notes he generally does not have them about the time the assessor comes around.

Q. Then the fault is in the execution of the law?—A. It is in the execution of the law largely, or enforcement of the law. The system seems to be deficient in being enforced for some reason. The fact of the business is, if a man has a farm it lays out there; there is no getting away from it; there is no covering it up.

Q. The same way with chattel property?—A. Exactly.

Q. Now, have you any suggestions to make as to amendments to your law that would secure a more equitable distribution of the burden of taxation?—A. Well, I do not know as I have any plan that I would be prepared to present intelligently to this board at this time.

Q. Have you tried anything different from your present plan?—A. We have resolved and resolved everything, every year, before the legislature, but something always comes up that we get beaten out of reaching this personal property problem. Perhaps the most vexed question we have in our State to-day is an equitable system of taxation of all kinds of property; and it is one that is being studied a good deal, and I think perhaps we may, in the near future, reach some plan that may be beneficial. But for me to express my mind about that just at this time, I should not care to do it, because I am not prepared to put anything in tangible shape; only I can say this much: That I think all classes of property should bear an equitable proportion, just as nearly as possible, and should be reached by a system of law that would enforce it, to reach all classes of property, whether it be a listing system or some other system.

Q. What, if any, has been the decline in the price of agricultural products in, say, the last 20 years?—A. Prices have declined in 20 years on wheat and barley and meats of all kinds fully 15 per cent, until just at the present time, or perhaps during the past year, there has been a tendency in the price of meats to increase, for the reason that there is a shortage in both cattle and sheep, not, perhaps, in hogs. The cause of it is perhaps overproduction; we are producing perhaps more, as a country, than we are consuming.

Q. (By Mr. RATCHFORD.) You say that the prices of farm products in the last 20 years have decreased 15 per cent?—A. I think they have.

Q. Has the cost of producing those products decreased in proportion?—A. No; it has not; it has rather increased. That is the trouble with the farmer.

Q. That would leave the farmer in a comparatively worse condition to-day than he was 20 years ago, would it?—A. I think, on the average, the farmers in the older sections of the country are in a worse condition than they were 30 years ago financially.

Q. In view of the improved methods of farming, is it not generally accepted that the cost of production is reduced?—A. Well, that has been attempted to be shown; that with the use of machinery, etc., the cost of production has been reduced, and I do not doubt but what that is true in the West; but, as I said before, the cost of growing a crop in the older countries has increased, and the price of the product has decreased, and the labor system has not changed; it is twice as high now, almost, as it was after the war.

Q. I understand you to say that the productivity of the soil has depreciated?—A. Yes.

Q. Probably nearly one-third?—A. Yes; and in many cases more than one-half. The cost of fertilizing has increased.

Q. Will you state that, approximately, per acre under cultivation?—A. No man that is putting in a crop of wheat or a crop of barley, where they raise it, thinks of using less than one ton of fertilizer per acre, and that would cost \$25 an acre. I do not know whether they are giving us as good goods now as formerly or not; but the price has not been far from \$25 for the last 10 years.

Q. Well, those two items of expense in a large measure explains the failure of production in the older farming sections?—A. Yes. As I said before, the soil in its virgin state was producing large crops without any fertilizers whatever. Large wheat crops were raised. I can remember when I was a boy we used to raise 30 or 40 bushels, and our fathers used an old-fashioned drag and tipped the sod over a little bit and threw down the wheat and raised a big crop. That is all. To-day you must fit your land almost like a summer fallow, using all the improved methods and machinery, put in fertilizers at the rate of a ton and a half an acre; and when we come to raise wheat for 60 cents a bushel, you can see where the farmer is.

Q. The farmer who has 160 acres usually has how many acres under cultivation in your country?—A. If the farmer has good tillable land he will have probably 100 acres of that land under tillage.

Q. And will the same fertilizer be required for raising other crops?—A. Not so largely; although it used to require about the same to grow a barley crop; but we did not consider with oats that we needed over half.

Q. Then, the item is not a very large one?—A. Yes.

Q. (By Mr. A. L. HARRIS.) You spoke about the decline in value of your agricultural lands. Is that owing to the smaller production and lower prices?—A. Yes. The real cause of the matter is, at the ratio that we were continuing on, the way we were going and driving there, the agriculture in the older part of this country—the Eastern States—was fast becoming a thing, as you might say, non est. Everybody was trying to get rid of a farm simply because there was no pay in it. They could not get any money out of it. That is, where they depended entirely upon growing cereals; depended upon the growing of wheat, barley, and oats in the old-fashioned way of farming. Every man was traveling just as fast to the poorhouse as he could get there because he was coming out every year a little worse than he was the year before. That is simply the main trouble with the farmers to-day in the Eastern States, that they have run behind, and have had to mortgage their farms, and the interest and the depreciation in prices have used them up. That is all there is to it.

Q. (By Mr. FARQUHAR.) What class of products has succeeded the cereals?—A. In our country diversified farming is fast becoming the ruling thing. Fruit growing is probably taking the place of any other business in our section of the country.

Q. What is your knowledge with respect to the extent of dairying now?—A. Dairying is paying better just at this present time in some certain sections of our State than it has for the last 10 years; and why? Simply because they have been all dried up, and there has been a less production of the flow of milk, and, of course, it has increased the value of the product. It has not been because those things have brought any better prices particularly, but simply an advance in price because they have not had the production. It makes a big difference whether you have a big crop of anything or whether you have a shortage. The supply and demand have controlled the prices largely in farm products, as in potatoes, and anything we grow, excepting, perhaps, the cereals.

Q. Is dairying any more costly in the State of New York than it is in the State of Illinois?—A. Yes; I think perhaps it is, for the reason that their land, in the first place, has not been worth as much per acre as it is here, and I think in certain portions of the West their grasses are as well adapted to it, with a few exceptions, as those in the Eastern States. There are only a few of the Eastern States that are especially adapted—their grasses—to make butter and cheese. You take Herkimer, St. Lawrence, Jefferson, and Lewis, their grasses are peculiarly adapted for the making of butter and cheese. But this year the reason the price has advanced so largely in that locality is simply because they have all been dried up; they have a short production. It never was so dry. Our State, as a whole, never has been so dry in the history of our oldest people; we never had such a drouth.

Q. Do the Western dairy products come into sharp competition with the New York products in dairying?—A. They do. I am frank to say that I think the

West has the better of the East in dairying to-day. That is, their products are sold in large quantities in the Eastern markets for more money than our people are getting.

Q. What is your success in the root crops in comparison with the West—potatoes, turnips, and rutabagas, and so on?—A. I think there are certain sections of our State that can grow potatoes and root crops, except perhaps the sugar beets. They can grow sugar beets to better perfection in California than we can, but there are certain sections of our State that grow as good potatoes as are grown anywhere. But we are not in it this year because we have been so dry, and there is going to be a shortage. The climatic conditions make a big difference, especially on farm products.

Q. Are the facilities for dairying any better in the State of New York than they are in the West?—A. I think not; I do not think they are as good. I think that there are portions of the West that excel the East in the manufacture of fine butter to-day.

Q. Butter and cheese?—A. I would not say they do in cheese, but I would say they do in butter.

Q. Is there any advantage to the New York farmer in the fact that he has a shorter haul to the New York market than the Western man?—A. Not a bit. He is worse off. A man living near Chicago or accessible to the Chicago market, is better off than the man living up in western New York.

Q. The farmer selling in the Chicago market, of course, sells at a margin below the New Yorker?—A. I suppose they do, as a rule. What I mean to get at is that a man to-day that has to depend upon local transportation between noncompetitive points is "in the soup." He can not get the fair equality of rates that exists between competitive points. In other words, the railroads calculate to make up on the poor fellow that lives in between. He is in between two fires, and they are going to make up the long haul on these short-haul fellows.

Q. (By Mr. RATCHFORD.) Do you mean that the man who is selling his grain to the elevators is in the soup also?—A. I believe he has been.

Q. Do you think he is there yet?—A. Perhaps he is a little better off than he was. I do not think he is much.

Q. (By Mr. FARQUHAR.) Do you think there is much discrimination in railroad rates in your section of New York State?—A. Well, I think there has been a very large discount made in the way of rebates to large shippers. But, of course, the argument used for that is—and I do not know but what it is a fair one, too, in some respects—if I am shipping over a line of road three or four cars of stuff a week, I certainly ought to be entitled to a little bit of consideration over the man that is only shipping one a month.

Q. Is that the view that the railroad manager usually takes in making a traffic bill?—A. Well, I rather judge that is true. If you were running a large business and a man should come to you and tell you, "I want \$1,000 worth of stuff; there is the cash;" and a man should come to you and say "I want a hundred," you would be quite apt to give that fellow a little inside, would you not? That is a thing that exists and perhaps exists on business principles, and it is a pretty hard thing to regulate, and I am inclined to believe that the fellow is entitled to it.

Q. (By Mr. A. L. HARRIS.) Is there an increase or decrease in the acreage under cultivation in your portion of the State of New York?—A. There is a decrease, especially on cereals. The growing of wheat is becoming very much decreased.

Q. I have reference to the number of acres under cultivation—of crops.—A. No, I do not think there is. I think there are other crops that are taking the place largely, perhaps, of wheat and barley. For instance, they will now go into small fruit growing. They keep that land under thorough cultivation and they grow some other kind of crops. A great many people are raising a good many beans in our country now that did not raise beans a few years ago; and so the thing is being changed around somewhat. I do not think there has been any decrease in the cultivation of the farms, as a rule: there may be exceptional cases.

Q. Have you any knowledge with regard to the West and Northwest on that subject?—A. Well, only as far as my own personal knowledge is concerned in regard to some land we own there. There seems to be an inclination to get into producing wheat just as fast as possible, and I think that generally prevails. Anybody owning any land out there wants to be getting something out of it and getting it into condition to sell. If a person wants to dispose of his land out there he must have it under cultivation. It must be put in shape so that a man can produce something out of it. I think there is an increase of the agricultural lands under cultivation in the West.

Q. Has that developed more rapidly than the wants of the country demand?—A. In some years.

Q. What effect, if any, has that had on prices?—A. It has had the effect, undoubtedly, to make, perhaps, some lower prices, although I think the production of wheat is growing visibly less all the time in the East, and there must certainly be an increase in the West to keep up the ratio that we have had, and I know from personal experience that you can grow wheat in the Dakotas—and in those wheat lands out there they can grow wheat for 50 cents a bushel, and even less, and make more clear money out of it than the farmer could grow it in the East at 75 cents.

Q. What have you to say in regard to the organization of agriculturists, its benefit, and the objects sought?—A. My idea in regard to that matter might differ from some other people. My idea is that the great need of the agriculturist is organization and a more intelligent knowledge of the affairs of the country and especially of his own business. I believe that, from my own personal observation in all the counties; and I am told—I do not say this for myself, but I am told this by one of the institute force—that wherever the grange—I am speaking now particularly of the grange or the farmers' clubs—wherever they have a good, firm hold in the county, they are the most progressive farmers, and that they are nearer up to date on all the leading questions of the day than in the counties where they have not any; and from my personal observation, I am sure that with the organization of the farmers there is not only a better feeling among them, but it is also beneficial to them. I do not look at it perhaps as some do. I do not argue the organization of the grange especially on the ground of its financial benefits as much as I do upon its educational and social benefits.

The great social benefit of the organization is that it brings within the circle the farmer's wife and his son and his daughter; brings them all in as one family inside of an order where their rights are all equal. And, of course, with the touch of shoulder to shoulder in discussing subjects which pertain to the farm and household and other business, it can not help but be a benefit; and socially it is a great benefit, because it takes the hard-worked housewife—as many of them are on the farm, brought up to hard work—it takes them out away from that, uniting their minds at least once a week or once in two weeks, and makes a new life to them—opens up a new avenue of thought and life to them; and, as far as I can see, it has advanced the farmer very much in our State since the organization of the grange. I consider it one of the greatest organizations for the farmer that has ever been effected, and it is destined to do a great deal of good for the farmer. As they become more intelligent and understand better what their needs are, they will be better prepared to meet all these great questions that are affecting the country to-day. Of course, all I can point you to to show you what the order has done is to say we got quite a finger in the pie in getting our Department of Agriculture and getting the commissioner appointed. We got an assistant in there that used to be the head of our National Grange—a grand, noble man; and it has done a great deal to build up the farmer and is destined to do a great deal more. We are organized now from the East to the West and from the North to the South, with connecting links.

Our organization is not a political one. We do not advocate politics in the least, and political discussions are never held any further than discussing questions of political economy or things of that kind. Partisan politics are never discussed in the order, and its ultimate objects are sociability, fraternity, intelligence; and, also, we aim at the beneficial part of it.

We have organized fire-relief associations throughout our State, especially, that have saved to the farmer thousands and thousands of dollars during the past 10 years in the way of insurance on a good, safe plan; carrying in our county, now, over \$4,000,000 of insurance just as good as the mortgage on any first-class farm in the county, and there is no squabbling. If anyone has a fire he gets his pay; no big office rents to pay; no big salaries. Our business is done on an economical, but not any niggardly, plan.

Q. (By Mr. FARQUHAR.) You say you discuss in the grange the economical and social questions. Have you ever discussed taxation?—A. There has perhaps been as much discussion of that as any one subject. There is a difference of opinion. Some persons are in favor of exempting personal property, and there are others who favor taxing it, and, of course, we get up against the stump where we are divided.

Q. You can not get the farmers all of one mind?—A. It is pretty hard to do that, the same as other people. They are of one mind that land is paying an unfair proportion of the tax of the country.

Q. They have settled on that proposition?—A. That is settled.

Q. Why do they not take the next step through organization to remedy it?—A. They probably will if you give them time.

Q. You are in hopes they will?—A. We are in hopes of doing it. It is a non-partisan question and one that should have the best thought of the best men we have in the country to-day. It is one of the leading questions.

Q. (By Mr. RATCHFORD.) You spoke of personal-property taxation. Can you state to the commission what percentage of the personal property of your State taxes are paid upon? Have you any reliable information on that?—A. I have; and I speak from memory—I do not think that the personal property of our State is paying over one-quarter; I do not know as it is that.

Q. However, the contention of the farmer is that if personal property was taxed according to its value, as his possessions are taxed, the burdens would be lightened on him?—A. Yes. We are not finding any fault with our State taxation; it is merely nominal, only fair. The trouble is the local taxation. Lots of our own people are as much to blame for that as anybody else. We go on and do things locally. I live in a rural town where there are several little villages. I remember when we only paid \$1,000, equalized at \$1,000 on tax. That was a big thing locally. To-day we are paying over \$6,000. And what is the reason? It is largely on account of bills that are made that are unwarranted, a great many of them. In other words, we have a lot of fellows in office, and one says, "You tickle me and I will tickle you: you vote for my bill and I will vote for yours;" and they pass it through.

Q. You are speaking of your board of supervisors?—A. Board of supervisors and town boards. It is a wheel within a wheel, and in order to destroy the business you have to begin at the bottom and follow it right up. It will require courage to do it, no doubt of that.

Q. (By Mr. A. L. HARRIS.) That would be done at the ballot box?—A. It could be if it came to that point.

Q. Who fixes the rate of taxation for your county?—A. Our State assessors. We call them State tax commissioners.

Q. Who elects your State assessors?—A. They are appointed by the governor.

Q. Who fixes your rate of taxation for the township?—A. The supervisors of the different towns. We call them supervisors. They are under some other name in certain States.

Q. How are they appointed?—A. Elected by the people every 2 years now; it used to be less.

Q. (By Mr. RATCHFORD.) They fix the value?—A. They fix the value with these State assessors, who are appointed by the governor.

Q. (By Mr. A. L. HARRIS.) Who fixes the rate of taxation on the property after it is valued?—A. The supervisors.

Q. Who elects your supervisors or appoints them?—A. The people.

Q. That is, they fix the value on the people who elect them?—A. What we call the county board, composed of one supervisor from each town in the county, meets with the State assessors and they fix upon the ratio or equalization for each town in the county.

Q. That is for real estate?—A. That is for real estate.

Q. As to your personal property?—A. Our personal property—get it, if you can—by the assessor.

Q. Are not the wants of the present generation much greater than the wants of the past generation, so far as men go?—A. There is no doubt of that; but you would not want our people to go back to the recollections of their forefathers—going to church barefooted.

Q. If you enjoy the luxuries, do you not have to pay for them?—A. That is true; but if other people can afford these luxuries, why should the farmers be deprived of them if they work hard and share the burdens of the Government? Why should not they have an equal share with the rest of them?

Q. The tax raised in the county—where does that go to?—A. To the county fund and to support the poor.

Q. Does any of it go to the construction of bridges?—A. Yes; there is so much of it used for bridges and for the construction of public buildings, like our county buildings. Of course, when we build a new building, that is raised by a special appropriation; but there is so much set aside for repairs every year; but, as I said before, the large excess of taxes throughout the State of New York is largely local.

Q. Do you not hold your local officers who execute the law responsible?—A. We do try to, but what falls so heavily on us is the unequal opportunity of getting at the personal property, so much of it escaping taxation, and it is shouldered on the real estate.

Q. That is in the execution of the law?—A. It is, largely.

Q. And it is avoided how—by perjury?—A. We do not have the oath. The assessor says, "I will have to put you down about \$5,000 personal." "I have not got it; you are wrong." He will go into the house and bring out some bonds. "My money is in United States bonds." He will get these bonds. They will pass these bonds around, and by and by they will get back. They have an understanding. That is done time and time again. A man who has money works every way to get rid of paying taxes.

Q. (By Mr. PHILLIPS.) That is, some men do?—A. Lots of them do.

Q. (By Mr. A. L. HARRIS.) Now, I do not know but what I had better ask you what is the relative cost of production—what is the cost of production, including interest on capital, cost of labor, and other charges, of agricultural products?—A. You want me to tell you whether it has been increased?

Q. Yes; increased or decreased?—A. The cost of production has been increased from the fact that the virgin soil has departed, and we have to keep up a better state of cultivation, have to use artificial manures in order to keep up the fertility, and, of course, the cost of production has been increased. Interest has been lowered.

Q. What have you to say in regard to combinations to control prices of farm products; combinations of men and money, I will say?—A. Do you mean to call in with this the undue speculation?

Q. I have reference more to combinations of railroads and elevator men?—A. We do not see as much of that in our State as they do in some other States. It does not affect us so materially. Only as regards local business, as between non-competitive points. We are not affected by that so much as they are in the West, because we have such a competition; so many different lines of road, with the old Erie Canal as a balance wheel, that they can not pinch us so hard as they do out West; only as between noncompetitive points. If they catch us anywhere where there is no competition, in between lines, we have to take it. That is all there is of that. They will put on to us just all we will stand.

Q. You have an interest in the Northwest; what observation have you made there?—A. I think that they have taken advantage of us. The railroads and elevator men have undoubtedly taken advantage of the producer to quite a large extent; but I think that some laws that have been passed have been tending to get hold of them pretty sharp out there, so they are doing better than they used to. They now ask only about half, where they used to take two-thirds of it. On the whole, I think these combinations are not to be countenanced; in other words, they are detrimental to the best interests of agriculture.

Q. What effect, if any, does dealing in futures, puts and calls, have on the prices of the farmer's product?—A. I think it has a very bad influence indeed, and it is a thing that ought to be regulated by stringent laws. If a man wants to deal in that commodity let him deal in what he actually owns. For instance, if a man buys 10,000 bushels of wheat, let him buy or own 10,000 of wheat, but do not let him buy 10,000 bushels of wheat and control 50,000, as it has a tendency to make fictitious values, and has a tendency to keep up an unrest in the prices of things that do actually exist, and affects the producer more or less injuriously.

Q. If you have an opinion as to the extent and variation of the markets, I would like to have you develop that?—A. I could, perhaps, say a few words on that subject. I believe in the future of this country. We are a country that produces more than we consume, and it should be a part of the plan and purpose of our nation to attempt, which we can readily do, to put our products in the Old World, and we can do it at prices that they can not compete with, and can give them a better article than they ever raised. The opening of our grain cereals in China is going to be a great benefit to this country in time—it will take time to do all these things. I will state the advantage to be drawn on one line, and you can apply that to other things as well as the one I tell about, and that is fruit. Now, our trade is being sought to-day in Germany, in France, and in England. In fact, Canada and this country are the fruit-producing countries of the world, and they are depending upon our fruit to-day more than ever before. You can just watch the exports every year and see what we are exporting, and how our exports are increasing from year to year; and the only question to solve is how to give these people an honest product, to give them quality that is as good as they can produce for less money than they could put it in for, and there will be no trouble about the control of the market. If the people want our stuff, they will buy it if you will give the quality and the price, and with the opening of our trade in foreign countries we are bound to be the people of the whole world to furnish these people with their products, and it will furnish us the means of making up all this supply and demand we are talking about. We will have the demand if we will give them the

product and give them the price, and it is opening up more and more every year, so I have no fears whatever in regard to agriculture if we do not undertake to put on some protective restrictions in some shape that we can not get into that country. If they will give us the chance to get in that country, we are not afraid of the whole world; we can do it in price and quality; there is no doubt about it.

Q. Have you any remedial legislation that you would care to suggest to the commission? Look at Part III, and if there is anything there that you care to make any suggestions on, we would be glad to hear it.—A. Regarding these trusts and combinations, anything that makes a monopoly of a product should be discountenanced by the American people. That is my judgment, and that is the position of the farmers in the State of New York. There is quite a difference between what is called monopoly and cooperation. They are two distinct things. Any business that is done with the prospective view of creating a monopoly against the producer or consumer of products should be discountenanced by the American people. I will say that much, and on that line you will find the Grange will work with you, or any line you may develop.

Regarding the oleomargarine laws, we have already a good law in our State, and it is being very well carried out, and should be extended throughout the whole country.

In regard to the operation of the pure-food laws, the National Grange at its last session passed a resolution recommending legislation securing pure-food laws. I believe we are the only nation on the face of the globe that has no law protecting its food products. It is a very important thing. A man starts out and produces a certain article of food; he starts out with it pure; he puts it out as a pure food; some smart Aleck comes out and gives an article which looks like it and puts enough adulterant into it to ruin everything, and in this way this fellow undersells the other; and that is what the whole country is doing; they are adulterating products so it is crowding out the manufacture of good goods.

Q. You want Federal legislation on that?—A. Federal legislation.

Q. And uniform State legislation?—A. We want uniform laws to protect food products—everything that goes into man or beast.

Now, regarding this last question here: "Existing Federal and State laws to prevent the spread of disease among domestic animals"—there is a limit to that. I believe that there are very many men in our own State to-day who have been treated unfairly under the existing State law regarding tuberculosis. There was a member of the institute force, Dr. Sinead, who told me only the other day that this commission appointed by the State, that was traveling about the State, was creating a great deal of disturbance, and, in many cases, doing a great injustice to the dairymen. He said there was not a single case—hardly a single Jersey in the State—but what would respond to the tuberculosis test if it was applied just at the right time, if the animal was just in the right state. He said, giving an example, one man had a herd of 100 Jerseys, and he was sending his milk to New York, and these fellows went up there and quarantined his herd—claimed he had a showing of tuberculosis. He said, "I went up and examined them myself, and I said his cattle were all right." But that herd was quarantined, and there he was with 100 head of cows, and he had to keep them or subject himself to the whole of them being killed at the expense of the State. On the other hand, there are cattle that are diseased, and the fellows are mighty anxious to have the State kill them and pay for them. It is something that works both ways, and wants to have some careful looking into; and some Federal law should be passed regarding that. Of course, I am not prepared to say what ought to be done, but it ought to be looked up.

(Testimony closed.)

WASHINGTON, D. C., January 5, 1900.

TESTIMONY OF MR. JOHN FRANKLIN CROWELL,

Writer on economics and sociology.

The commission met at 11 a. m., Vice-Chairman Phillips presiding.

Mr. John Franklin Crowell was introduced as a witness, and being duly sworn, testified as follows concerning agricultural topics:

Q.—(By Mr. A. L. HARRIS.) You may state your name, place of residence, and occupation.—A. John Franklin Crowell; 75 Wilson street, Brooklyn, N. Y.; by occupation I am a teacher and a writer on economics and sociology.

Q. You may state, if you will, what has been your interest in the industry of agriculture in this country.—A. My interest has been wholly with the scientific side of the subject; rather from the standpoint of the economist and sociologist. I have been interested in the general conditions of the rural population, the movement of the population from the cities to the country, and vice versa, and the migration of agricultural peoples in modern times, particularly. These are the questions with which I have interested myself and on which I should be glad to speak before the commission.

Q. You may state, if you will, to what extent you are conversant with the industry of agriculture, personally.—A. Well, I lived on a farm most of my life, until I was 21, and at times managed the farm for my father, so that practically I know how to farm—that is, I did at one time—and have ever since been interested in the subject from a scientific standpoint. My interest in the subject has not been financial in any sense, but wholly that of a scientific student.

Q. Have you been a contributor to periodicals on subjects pertaining to agriculture?—A. I have written for the Political Science Quarterly a series of articles on certain agricultural questions, mainly on the sugar question. I have also written on agriculture in Europe—the economical aspects of agriculture in Europe—for the Annals of the Academy of Political and Social Science at Philadelphia, and have equipped myself in other directions in the study of agricultural questions in Europe.

Q. That study was from personal observation?—A. Yes; from the visiting of farms, and the study of transportation questions, as they relate to agriculture, in the office of the German department of the interior and the English board of trade offices.

Q. Have you examined the plan of inquiry adopted by the subcommission on agriculture of this commission?—A. Yes.

Q. Are there any topics in that plan that you can give information upon?—A. I think there are certain topics to which I have given special attention, and on which I should be glad to state my conclusions.

Q. Please do so; and each topic that you take up, follow it out to your satisfaction in giving the information.—A. Beginning with Part I, No. 17: "Tendency to colonize—to preserve foreign customs and languages." In the United States a large part of our agricultural labor has come from more or less systematic colonization. These "colonies" have taken up carefully selected tracts of land, and thereby laid the basis of a high degree of economic prosperity. They have not selected the land as the individual selected who dislodged himself from Pennsylvania or Massachusetts and went to traveling, but they have selected it through carefully chosen agents, as a rule. My observation of these colonies is that they preserve their agricultural instincts and their agricultural abilities on a much higher level than the American farmer, who has moved from the East to the West. Take the historic case of the Pennsylvania Dutch, who are undoubtedly the finest farmers in the United States to-day, and have maintained the country in the vicinity of Lancaster, Reading, Allentown, and so on; they have maintained their industrial enterprises amidst all changes of prices, rates of interest, and so on, so as to increase their wealth, maintain their standard of agriculture, and keep up the standard of living, while other sections of the country have deteriorated and lost ground, especially in hard times.

Q. (By Mr. CLARKE.) Is that the section known as Chester Valley?—A. Chester Valley is largely English and Scotch-Irish—further south. It is the section known as the Berks section, Lancaster section, especially.

Q. Along the main line of the Pennsylvania road?—A. Yes. After you strike the Susquehanna. York is Pennsylvania Dutch. That is the locality with which I am most familiar. I have lived and traveled a good deal among them.

Q. (By Mr. PHILLIPS.) Is there any special advantage of the soil in that section of Pennsylvania over the soil of other States in the Union?—A. There are special advantages in Lancaster County particularly, but the capitalization is high. An acre of land 80 miles from Lancaster sold for \$200, 15 years ago. Capitalization is high, but at the same time they have always been able to make a very reasonably satisfactory profit, and even a high profit, out of their land. So it is the adaptability on the part of the farmer that enables him to adjust himself to great changes, just as the English farmer does constantly if he is free to do it, if he has not any lease that runs 15 years ahead that obliges him to put in a rotation of crops when there is little sale for that particular crop. The American farmer is free to adjust himself, if he has the agricultural skill and agricultural instincts and keeps himself informed, and maintains himself in a good condition; keeps up house, barns, stock, food, and clothing, and lives well—he is able to adjust himself almost immediately to the changes; just as the Lancaster and Berks farmer turns to tobacco

when grains fail, or something else. Now, these are the people who have practically colonized that section and kept it colonized for 100 years, and I think their success as farmers is largely due to the fact that they have not taken part in that tendency on the part of agricultural people generally to enjoy the luxuries as distinguished from the substantial. That is, they live well—on the top of the pile, so to speak; but they do not waste their resources in luxuries; they put the surplus capital into the farms or into the education of their children. There is where their strength lies. That is the case with the colonies in the Northwest.

Q. (By Mr. FARQUHAR.) What do you mean by luxuries? Trotting horses, fine equipages, visiting watering places, etc.?—A. The purchase of a buggy for every boy as he becomes 18 years of age.

Q. (By Mr. PHILLIPS.) Could that be done in New England, or the Western Reserve of Ohio, in a more level country?—A. Yes; if their customs and race and colonial solidarity had been great enough to hold them together to resist these encroachments on purely business capacity.

Q. Is not the soil in the eastern part of Pennsylvania among the very best in the United States for a diversity of crops and to maintain such a system as you speak of?—A. That is true.

Q. That could not be maintained so well in a level country, could it? West of the Allegheny Mountains, could they diversify as much, or in the hills of New England, as much as in Pennsylvania?—A. I think so. The nearer to the city, the greater the chances for diversity are. In the West, in the rich prairie lands, they have had the same advantages of soil, but have gone on and exhausted the soil until they were obliged to rotate crops in order to get a return on the capital. Take the Scandinavians of Minnesota and the West; there is the same strong colonial solidarity and the same vitality and the same fidelity to the interests of agriculture as a domestic institution. The farm unit is the life, center, and soul of the community. Their lands are, of course, good, but at the same time the high level to which agriculture has been brought in the Northwest and the prosperity of these farmers is due, in my estimation, to the prevalence of that colonial solidarity among them, which resists causes which impair economic efficiency in agriculture.

Q. (By Mr. FARQUHAR.) Do you not mean also the great frugality that is found among them?—A. Yes; of course, they make money, and they save their capital. On the other hand, you have not the development of that kind which has exhausted the capital of farmers in many other sections of the country. That is the general tendency. The process of exhaustion of rural capital has gone on until men had to go to town because they could not borrow any capital to keep up the farms, and could not utilize what they had. They either had to take up new lands, where little capital and labor were required, and land that would enable them to produce with very little capital, or they had to go to the city where they found no capital to utilize, but had to work for wages. You do not find this process going on with these colonies of foreign peoples. They have been the mainstay and bulwark of progressive agriculture. That is my point. And the same thing is evident in the Huguenot colony of North Carolina, which came over from the valleys of the Alps, and which is making itself felt in exactly the same manner. It carries its standards of agricultural energy with it and applies it to the soil and resists everything that would detract from their high level of prosperity.

Q. (By Mr. A. L. HARRIS.) What are their habits of industry?—A. The most desirable in the world. These people in the Northwest, you refer to?

Q. I referred to these elements in Pennsylvania, the Germans and the Scandinavians—all.—A. As a whole, it seems to me they are highly industrious; that is, they work steadily; not any more days in the year than the people on the railroads of New Jersey do, but they attend to their business, is what I mean. They preserve their property; they do not leave their implements lie out in the field after they have used them, but put them away; they keep their houses and barns painted and in repair; they put a part of each year's surplus on the property to maintain it, so the depreciation does not amount to much for any particular year; it is spread out over a series of years.

Q. Do they economize their labor by looking after their crops when they need their attention?—A. Yes. I should judge, from the Pennsylvania people particularly, that they plant and sow such crops as succeed each other in the course of the crop year, so that no crop suffers for lack of attention when it is ready for harvest.

Q. Do they arrange their work so that the greatest economy is at all times apparent?—A. Yes. I should say that is a very high grade of economy, in the use of machinery as well as in the employment of labor.

Q. (By Mr. CLARKE.) Do you know any place in the United States where the farmers plow in clover for fertilizing the soil to the same extent that these Dutch farmers do in Pennsylvania?—A. I think the practice is growing very rapidly in North Carolina, in the Piedmont section, as well as in the eastern section, between Raleigh and Goldsboro.

Q. Do you not think the extraordinary fertility is largely due to that practice?—A. I do, largely.

Q. That might be done in all parts of the United States?—A. I think so. I am not so sure that clover could be raised to as much advantage in all soils. I think there is a substitute for it in some sections.

Q. (By Mr. RATCHFORD.) You spoke of the Scandinavians in the Northwest. What part of their success is due to their own economy, if any, as compared to that which is practiced by the farmer of New England and the Central and Southern States? Are they more frugal, more industrious, harder working, and more careful of their resources than the farmers in other sections of the country?—A. They are more given to continuous labor. Instead of hastening through with the work and having a rest period ahead, they take their pleasure in with the work. The traditions of the Scandinavian farmer are brought over with them. The economic traditions of the European farmer are one of the most valuable assets in American agriculture. The economic traditions of the New England farmer are entirely different. There is much more of the speculative in him, more of a disposition to anticipate prices, to meet the supply and demand through the distributive system than to wait for the ordinary course of nature to produce. In other words, he is a man of the city rather than of the country. Another part of your question was the application of resources. That might be answered by saying that it seems to me the Scandinavian farmer has had centuries of training in the effort to make a dollar go as far as possible; he had to do that in his little patch of land lying on the hillside or in the valley outside of the city in Scandinavia. That same talent of making much out of small resources is brought with him and applied in this colonial community of which he is part.

Q. You are familiar with the conditions of farming in the Southern States?—A. I lived there 7 years, and am fairly familiar with them.

Q. The farmers of that section of the country are perhaps less prosperous than in the central or eastern or even the northern or western sections?—A. Far less.

Q. Is it your judgment that the Scandinavians of the Northwest would be more successful in the Southern States, if transferred there and colonized, than the farmers of the South are at the present time?—A. No; because you take them out of the climatic conditions that have made them, and they would let themselves down very easily. The conditions in the South seem to me to be substantially this: The generation of able farmers has disappeared, and the new generation has not arisen. There is where farming stands; nobody to take possession of it. It lacks directive genius, lacks managing ability, and therefore capital does not go in that direction. The rewards of manufacturing are too great, the advantage of laboring for wages in the factory villages are too great, compared with the isolated conditions in the villages of the South, and therefore capitalists aggregate themselves in manufacturing, and as few people remain on the land as possible.

Q. (By Mr. CLARKE.) Do you not think the building of manufactories in the rural districts of the South will tend to encourage agriculture?—A. Undoubtedly; it comes to be built up from that center, and agriculture is improved more or less around the manufacturing village. The old system was built up on the basis of the foreign demand for cotton; the new system has to be built up on the basis of domestic manufacture as the market chiefly, and the new generation of Southern farmers will have to grow up to that idea. The old generation can not grasp it. You can not expect a man to change his agricultural ideas after he becomes 40 years of age. We are made at 40, and can not be made over afterwards.

Q. (By Mr. PHILLIPS.) We may grow?—A. Yes; in that line we have laid down we may fill out and develop. That, to my mind, indicates the importance of developing the South along the whole line, and the necessity of the South working out its agricultural salvation along this new line.

Q. (By Mr. A. L. HARRIS.) You think there is a possibility of its doing this?—A. I do.

Q. Will that be in the early future?—A. Just as early as the generation grows. I mean the new generation on the Southern farm, both colored and white.

Q. (By Mr. CLARKE.) It was in evidence before us yesterday that there is a new tendency among industrially educated negroes to go into somewhat remote districts, largely inhabited by blacks, and establish themselves upon small farms. Do you look upon that species of colonization with favor?—A. Very much, indeed; and the only thing that can prevent it will be the lack of education—I mean the

lack of wise direction educationally. If the Southern States fail to give the children of these people the proper educational privileges in the locality, that tendency is going to be checked, because the most ambitious character in the South to-day is among the colored.

Q. (By Mr. A. L. HARRIS.) Have you any information in regard to this colony at Farmville, Va.? There appears to be a colored population at Farmville that is making some rapid improvement.—A. No, I am not informed. I know of the experiment, but am not sufficiently informed to speak of it.

Q. (By Mr. FARQUHAR.) What kind of education would you advise for the South; the experience of the farm itself as they may drag along and gradually come into better habits of treatment of the soil, etc., or do you think education furnished by the school proper, which may last over 2 or 3 years, should be the primary and better plan of bringing in the southern farmer?—A. I should say that an education that is not first disciplinary would not be of much value to the colored people; and secondly, an education that is not primarily agricultural in itself would detract from their usefulness in agriculture rather than improve it; that is, it would probably cause them to leave the farm. So that any educational scheme that would be successful would have to first deal with the three R's, and then, secondly, with the plants and the soil and the atmosphere and so on. The child in every agricultural community ought to be taught among the first things that it learns, after it can read, write, and figure, what the resources of the family are, what the resources of the community are, what can be gotten out of it, and how to improve in the utilization of the natural resources of the community.

Q. Of course, as Southern farming stands now, it is merely a matter of grubbing for existence and life?—A. Yes.

Q. As to the education provided at Hampton and Tuskegee and other places in the South for the negro—would you regard the time spent in these schools preparatory for agricultural life as more advantageous than a lifetime simply on the old experiment lines, doing better than he did before?—A. Undoubtedly; but the educational problem must be finally worked out in supplying the locality with higher educational advantages.

Q. We presume, from testimony, that there are some fairly well educated farmers who have come out of these two institutions. Is it not practically a fact, all over this county, that one good farmer, not scientific, we may say, but a good farmer and the best in the community, is the leader of the community?—A. No doubt about it; but he is probably scientific in his own way, though he may not know anything about chemistry.

Q. Would it not naturally follow, if this education is fostered in the South—this very plan, whether for whites or blacks, ought to be the proper machinery to start this new epoch?—A. Yes; I agree with you.

Q. In other words, do you not think the school is of a greater advantage in making the farmer in the present age than it was a few years ago; book accounts, knowledge of banking, commerce, soil, and everything else, that it is really leading a person higher and higher above the old practical way of simply learning from those who preceded?—A. Yes.

Q. (By Mr. A. L. HARRIS.) Are the public-school facilities and the curriculum of the common schools, where the agriculturist usually gets his education, sufficient for the agricultural people?—A. By no means. The agricultural people are the poorest educated people in the country, and in Pennsylvania they get about half per capita from the State fund what they get in Philadelphia; that is, the rural districts get half as much per pupil as is paid per pupil to Philadelphia. If the educational facilities of the country were transferred to Philadelphia, New York, or Boston the people would move away in a mass; if they were obliged to remain there they would abandon such a school system the next day. No public-school system could exist if it did not maintain a higher grade of educational facilities in the city than is maintained in the country. I do not think that could be gainsaid.

Q. To what extent does the farmer take to technical education along the line of agriculture?—A. If it is rightly planned and properly taught he will take an indefinite amount, but if it consists in feeding 70 different kinds of food to 80 different kinds of pigs he will not take much stock in it. You understand what I mean—technical education run mad. He can not keep up with all that combination and permutation, as we used to learn in the arithmetic.

Q. Is it not profitable for the farmer to have a good technical education applicable to agriculture?—A. I think it is necessary. The application of science to agricultural processes is necessary.

Q. Is not a great deal of the improvement we now see among agriculturists largely due to the education they have received both at agricultural colleges and

the technical education which they may be taught in other schools aside from colleges?—A. Undoubtedly; but my observation leads me to believe that the instructed do not go back to the farms, and for that reason distinctively agricultural institutions have not found their normal function yet.

Q. (By Mr. KENNEDY.) How far has this technical education been a factor in the colonial localities you speak of?—A. It amounts to nothing practically as far as the Pennsylvania Germans are concerned, and in the Northwest, I have understood, from what I have heard a representative of one of these schools say, the Scandinavians are very much more apt to avail themselves of these advantages than the Pennsylvania Germans have been. I think technical training and the educational college have proved a larger factor in the Northwest than they have in the Eastern and Southern States.

Q. (By Mr. PHILLIPS.) And yet in this German colony they are more advanced in agriculture than they are where they have had more technical knowledge?—A. Yes; because they are nearer the larger markets, and respond readily to the demands of the market. Location has the most to do with it.

Q. They are learning by experience what others may be taught by science?—A. Yes; and that is all the technical institutions can do, to gather together the experience of the locality and the world, and apply it in such a way as to enable the farmers to make use of it. In this way the sons and daughters go to college and study, and in various other ways, by distribution of documents showing the results of experiments, and farmers' institutes.

Q. (By Mr. A. L. HARRIS, interrupting.) You have been in the lecture field before farmers' institutes?—A. A little, not much.

Q. How many years have you been at the business of lecturing before farmers' institutes?—A. I have done so only incidentally.

Q. You can not state, then, the improvement you have observed on account of the farmers' institutes?—A. No; I can not state to what extent that particular agency has resulted in improvement, though I can state that the localities with which I am most familiar, localities in the East, have made rapid advancement in the last 10 years, both in the condition of agricultural labor, in the capital earned by farms, and in the general improvement of the locality; that is, the ability of farmers to send their children to higher institutions of learning.

Q. What has been the effect, in your opinion, on the farmer, of organizations, such as the Farmers' Alliance and the National Grange? Have you made any observation along that line?—A. The main effect has been to oblige them to look at the relation of agriculture to the world market and the distributive system, with which agriculture has to reckon constantly. The grange movement and the grange legislation in the Northwest, the Farmers' Alliance of the South, and the Wheel in the central South, and almost every agricultural organization has been called into existence by the necessity of explaining why the farmer was getting so small a portion of what the consumer paid for farm products, and they have dealt with the question in various ways in the course of the last 15 or 20 years.

Q. Beneficially?—A. Largely, to themselves; not to other interests in every case. In spite of the failure of the Potter law to reduce railroad rates, I think their influence has had a helpful effect on transportation. As a law it was a failure, and they have also recognized that it is impossible to deal with discrimination from the standpoint of the individual Commonwealth. You remember the effort made by Pennsylvania to prevent discrimination; they had the best talent employed; the strongest and best newspapers in the State were enlisted in their interest; but it practically amounted to nothing because we came to see very quickly that the larger part of commerce was interstate rather than State, and that State local rates were based on State rates, competitive rates.

Q. Has not organization among the farmers raised the standard, not only of living but of profit to the farmer?—A. Undoubtedly, by improving his purchasing power. He has become a more intelligent purchaser in that way, and then it has given him a larger view of his function as a member of the community. He has felt that the agricultural interest is so intimately connected with all other economic interests that he must maintain a high standard of living in order to assert his equality, in order to preserve his social efficiency as a member of the nation.

Q. Has not organization among the farmers to some extent prevented the migration of the young men from the farm to the shop or office?—A. Yes; I should say it has.

Q. It has prevented the farmer boy from looking on the dark side of agriculture?—A. Yes; has given him association with his fellows. Instead of seeing no opportunity for himself as a leader, he has found an opportunity in the very fact of social organization.

Q. What has been the tendency of the intelligent farmers' boy. Has it been to remain on the farm, or has he, as a rule, heretofore gone into a profession or business?—A. I think the general tendency has been toward the professions and business of the city. Many intelligent farmer boys are drivers of trucks, street-car drivers and conductors; many of these positions are filled with farmers' boys; and the Navy is looking after farmers' boys now, and has enlisted a considerable number of them to man the vessels and make up crews.

Q. Is that advisable?—A. Yes; from the standpoint of the Navy.

Q. Does the farmer boy by leaving the farm and going to the town get a greater number of days employment, and thereby a greater profit at the end of the year?—A. Yes; as a rule, he does, if he finds employment. I think he is always capable, and as a rule he makes a much more efficient employee than the boy who has been city bred, and therefore he is naturally selected for his fidelity, for his perseverance, for his desire to make things succeed.

Q. (By Mr. PHILLIPS.) It is not really essential for a very large per cent of the farmer boys to seek other employment? Being raised on the homestead where there is a family of five or six boys, and not having means to purchase a farm, do they not seek other employment to a large extent? By the very nature of the thing, the circumstances which surround the farmer boys, are they not compelled to seek other employment?—A. Yes; and there is nothing alarming in it if he is free to go and free to return, it seems to me, provided a dollar of capital put into a farm holds out as good a prospect of profit to the boy as a dollar put into other enterprises in the city. It depends, in the long run, upon whether capital is as profitably invested in agriculture as elsewhere. In France you find the farmer's boy going to the city and working to accumulate capital, and going back and buying land, buying a little homestead; so that when work is a little slack in the city, or as he grows older, he can fall back upon that as a refuge and a place to maintain himself. There, you see, the movement of capital is to and from the city, and the boy is naturally going to fall back upon the place of his early associations. The city furnishes very few such attachments. In this country that process has not begun to develop yet. Out of the development of transit facilities from city to country, in which you can take advantage of flush times in the city and country, such result is likely to grow, it seems to me.

Q. Can you give the commission any information as to the comparative earnings of capital engaged in farming and other occupations?—A. Perhaps the best thing I can do is to take this statement. These figures are made up from the census of 1890, and they are figures by Professor Emerick, of Smith College, and can be found in his book on Agricultural Discontent in the United States.

Comparative importance of farming in the United States.

Industries.	Capital.	Workers.	Value.	Products (per capita).
Agriculture.....	\$16,000,000,000	8,466,363	\$2,460,000,000	\$290
Manufactures.....	6,525,000,000	4,712,622	4,210,000,000	693
Mining.....	1,340,000,000	636,419	471,000,000	740

Agriculture has invested \$16,000,000,000, has 8,466,363 workers, and the annual value of the product is \$2,460,000, the product per capita is \$290.

Q. Per capita of workers engaged in the industry?—A. Yes.

Q. (By Mr. FARQUHAR.) The \$290 is the product?—A. Yes, per capita. Manufacturing is represented by these figures: \$6,525,000,000; only about half as many workers as agriculture. The product is not twice as much, but approaches that; the product per capita is nearly three times as much. Mining, of course, stands somewhat by itself as being more purely speculative. Now, you can see the farmer's boy, if he had these figures before his eyes, would not decide in favor of remaining on the farm. If you are going to go by general averages, this is a decisive argument in favor of moving to the city to get some of this extraordinary return on capital and labor in manufactures.

Now, I am not speaking of the cause of these results, but simply pointing to the fact that this corresponds to the general movement in this country. The main reason agriculture has expanded in this country is that we have had free land, and have admitted free labor from foreign countries to occupy this land. That probably accounts for the extraordinary development in agriculture; but the

extraordinary returns on manufacture are so much greater than those on the same amount of capital invested in agriculture, that that constitutes the great problem at which we are working; that is, we want to know what it is that causes agriculture to give so much less per capita as a return than goes to manufacturing.

Now, in answer to that question, I should say that we must remember that in agriculture the principal that governs prices and, therefore, the return on investment is competition; but in manufacturing, after a certain limit of competition is reached, the inevitable result is combination, and the combination has come about, not so much on account of anything that existed in the productive process, but on account of the difficulties of distributing or marketing the product. The beginning, the spring and source of combination, is found in the effort to market products in such a way as to give an even continuous return on capital, whether invested in agriculture or manufacturing. Manufacturers run ahead so far as to produce far beyond the demand of the market, and every 10 years or so bring to the country a depression in prices, ruinous to all. We see the importance of something in the way of a regulative. There is where the combination comes in. Between the producer and consumer lies the distributive system, and the principle that governs the distributive system is the principle of combination, while the principle that governs in agriculture is competition. In agriculture prices tend to remain near the cost of production; in other words, the lowest level of productivity—lowest level of efficiency of capital is found in agriculture. Manufacturing tends, after it has spent its competitive energy, to combine and organize the interests with a view of controlling the production in the interest of more regular prices, more regular process of development, more regular prosperity; manufacturing tends toward a higher and higher—toward a maximum of return on capital and reward for labor.

Now, in the distributive system which we are thinking of in connection with agriculture, the principle of competition prevails. When you have merely the small community in which the farmer brings his products to the home market from the farm in his wagon, and backs up against the curbstone, and sells to the housekeeper when she goes around to get her supply of provisions, you have no distributive system; when the Eastern farmer begins to produce for Europe, and the Western farmer for the East, the distributive features come in and grow larger and larger, and the great profits that arise are a temptation for labor and capital to go into that activity. So the distributive system will increase and increase until it becomes an upper millstone and grinds heavily on the community, especially if it has any legislation which favors it and is given any advantage in the way of premiums in the way of export, for example, or anything that guarantees to it a profit. That seems to be the condition at which we have arrived at the present time in the United States, where the distributive system is becoming a very large feature between the producer of agricultural products and the consumer, and under existing conditions the principle of combination prevails in the distributive system.

Now, under such circumstances, what is the wise line of policy to adopt? It seems to me that the line of policy is to equalize the opportunities of capital in distribution as well as production; that is the safe line to follow. If they are not equal, then we want to know why and wherefore. That is the reason I presented the subject, which I did, to the commission as a subject of investigation which would enable the farmer to see whether, after all, he was laboring under any great disadvantage. This discrepancy here [referring to preceding table] makes it plain enough that he is not getting a reward equivalent to that which is found in manufacturing and distribution in general. I class these two under the same general head.

Q. (By Mr. PHILLIPS.) The total value of property in the United States in 1890, if my recollection serves me right, was \$60,000,000,000, and of that \$16,000,000,000 was engaged in the farming industry. The census prior to that showed \$13,000,000,000 engaged in farming, and the census prior to that \$9,000,000,000. There has been a very great increase in the valuation of personal property over farm products, yet we have opened up many millions of acres of land that is very rich. The values of farm lands are settling and all other property is advancing much more than the farm lands. Have you any mode for accounting for that tendency?—A. My explanation would lie in this: That the rewards of capital and labor are much lower in agriculture than they are in other lines of economic activity, and that tends to exhaust the activity and throw the capital out of agriculture, reduce the capital, the valuation, and take with it the population.

Q. About 40 per cent of the people of the United States are engaged in the farming industry?—A. Yes.

Q. Yet they are not making the money in proportion to their number per capita?—A. No; they are not. But, I think, the explanation lies in the fact that, whatever the cause of the disadvantage may be under which it labors, it does not offer the field for investment—remunerative investment—that manufacturing, distribution, commerce, or other lines of activity do.

Q. Since our continental roads have been built, we find there has been a great depreciation of lands in the Middle and Eastern States, or more than is due to the opening up of these millions and millions of acres of lands.—A. That is due to the growth of manufacturing and commercial interests in the East, in which capital finds a much more remunerative field of investment than in agriculture in the same locality; and then, again, when labor finds that it can get land for very little capital outlay in the West, it is apt to leave even a somewhat advantageous position in the East. I mean a young man who has inherited a farm may not stay on it because he sees he has not the capital to make it productive, and that the same capital, if he sells out, will enable him to possess himself of land that is liable to increase in value with the growth of population in another State. That accounts for the depreciation in agricultural land.

Q. (By Mr. CLARKE.) Is not that the principal reason?—A. I do not know that it is the principal reason to-day, but it has been for a series of years.

Q. (By Mr. FARQUHAR.) Is it altogether a question of production that gives this \$200 to the agriculturist and \$800 to the manufacturer? Do you think it is possible under any system of economies or improvement on the farm, or increase of crops, to raise, for instance, the wages of any of the farm laborers up to and beyond \$2 a day?—A. That would depend on the level of prices that prevail at the time. The farmer has to adjust himself to the conditions outside—the demand for his product. If that price is high enough for him to demand labor at \$2, then, of course, it would be safe; if it is so low that he has to dispense with all his labor, he may have to resort wholly to machines, as the British dairymen had to resort to milking machines, because they could not get laborers to milk the cows.

Q. Is not the farmer handicapped in that he can only go so far in production?—A. Undoubtedly.

Q. He must add acres simply to add to the amount he produces?—A. Certainly; he is governed by what we economists call the law of diminishing returns; that is, there is no absolute point at which he must stop production, at which he can not increase the product, but for every additional unit of capital and labor he will get less than a proportionate return in product. Now, in manufacturing, the law of increasing returns applies in general. We are speaking of general principles now; that is, if with 10 looms, or machines which feed looms, which precede it in the manufacture of the product, you can turn out a certain amount of product, with 10 added, you can more than double it. The law of increasing returns comes in, so that the farmer is limited by nature in a way in which the manufacturer is not, to a certain amount. This discrepancy is bound to be attributed to that.

Q. There is an economic law, and while you are discussing this very thing you can not pass beyond that law, because it has the approval of the world already and is accepted by all economists.—A. Yes. But on the other hand, it must be equally clear that the land, which was supposed to have reached the point of diminishing returns, can by some discovery in the art of agriculture, scientific analysis of the soil, or other modes of increasing the efficiency of the land, be made to produce a much higher return than it did under the older principles or older methods of cultivation.

Q. Is there any reason why we should not produce from ordinary good land in this country just as good crops as they do in Great Britain?—A. No.

Q. Is it not really the prodigality of the American farmer that is the cause of a good deal of this productivity?—A. It is due largely to the fact that the American farmer has not had the experience of centuries back of him which the English farmer has. To my mind, the English farmer is the most capable farmer in the world, because the business of land holding and land cultivation are separated there, and the farmer has simply his free capital to put in and pays rent largely as an interest on the capital which the landlord has already invested for buildings and drainage, etc., and he is free to make the most out of that soil within certain recognized rules of cultivation, and his adaptivity is marvelous.

Q. (By Mr. PHILLIPS.) Are there not climatic reasons for it? In England they are not subject to drought as they are in this country; they are not subject to severe winters which interfere with crops as in many parts of this country; there is hardly one country where it is so even.—A. I had the impression that many of

the disadvantages of droughts in this country are offset in England by the heavy rains which they frequently have. In the last decade, for 8 successive years they lost a large proportion of their crops by rains.

Q. (By Mr. FARQUHAR.) Also wind storms?—A. Oh, yes; but in spite of that they keep up wheat growing, and grow in competition with many American farmers to a certain extent.

Q. (By Mr. A. L. HARRIS.) Is it possible for the American farmer with the number of acres that he tills to so carefully fertilize and till the soil as in England?—A. It is hardly possible, and it would not be wise. The farmer would not succeed if he put the capital on his land that the English farmer puts on his land. The American farmer puts capital into his land just as fast as he can utilize it, as a rule, and he does not go much faster than the land requires. That is rather on account of the state of the demand from the land. To put it in another way: If the farmer set up a farm such as the English farmer cultivates, and invested the same proportion of capital in labor and in machinery, etc., and farmed very much the same way, it is doubtful if he could get his return on so high a capitalization. I think, as a rule, American farmers have gone just as fast in improvements, in the capitalization of their farms, as the state of the demand has justified. They cultivated extensively when they had little capital; as their capital increased they gradually became more intensive in their methods; and when capital falls as low as 3 and 4 per cent, then you will find that the capitalist will find the agricultural investments very far from what it is now. Prices remaining the same, they will find in agriculture an excellent outlay for their capital, as they did in the East when the Western farm-mortgage fever struck the country. These movements of capital to and from the land depend on the ability of the farmer to see his way clear to make a sinking fund for himself in the course of, say, 5 years.

Q. Have you studied the question of the taxation of farm property?—A. Yes, to some extent.

Q. In your opinion, does the farm property pay more than its just share of taxation?—A. Yes, I think it has. It has seemed to me to be very clear that the rate of taxation in many of the States is too high for farmers to buy land and buy rural property. They sell because the values have declined. Taking taxation into account, it is not possible. Take this instance in Massachusetts with which Colonel Clarke is no doubt familiar: I was present at a meeting of farmers three years ago, in which a number of them stated that they had been paying at a rate of \$15 per \$1,000—I believe that is the tax rate generally prevailing in rural Massachusetts—and that when they came to sell those lands, those properties, on a \$1,000 valuation, they realized \$600 and \$700. Now, under those circumstances, you see, their rate of taxation is much higher than is the case elsewhere where property sells a good deal above its tax valuation; and that means that an extra burden is placed on capital invested in rural development which is not placed on capital invested elsewhere. Consequently the tide is going to move away, and people are not going to invest in rural real estate, and its valuation is going to decline. While that seems to me to be the peculiar burden, peculiar disadvantage, under which owners of real estate in the country are laboring, I think it is true, as Governor Roosevelt has stated in his recent message, that real estate is bearing entirely too large a burden of taxation, and that that is especially true of rural real estate.

Q. There is no possible chance for real estate to avoid the assessor?—A. No; he will see every pig and cow, live stock as well as real estate; he will see everything that is on the land.

Q. What do you say in regard to the decline of agricultural products in this country? If there is a decline, what has been the cause?—A. Well, there has undoubtedly been a decline. The level of agricultural prices has declined since 1850. I submit a diagram taken from the report of the royal commission on agricultural depressions, and I think it brings the matter before one's mind in a convenient compass. It shows the growth of production from 1849 to 1872, the first half of the second half of the century, a growth of about 70 per cent; also the price advance in the same period, about 30 per cent. Then from 1872 to 1894 it shows an advance of production to 40 per cent, and a decline in prices to 60 per cent. There is a divergence; that is one of the noteworthy points brought out by this diagram.

The chart above described follows:

Royal Commission on Agriculture. Final Report on Agricultural Depression. 1897.

Now, if a farmer is selling products he is increasing his products and has to sell them in the competitive market of the world at a constantly declining price, and you can understand that he is in a difficult situation. He has contracted debts, as you are well aware, probably borrowed capital in a time when prices were advanced, with the expectation of paying it back and paying the interest on it without difficulty or embarrassment; but when this state of things sets in you see that he is bound to borrow more, most likely, to meet his obligations, and to borrow it against a declining level of prices, so as to embarrass himself more and more as he goes on. He sees no way out of it. His success as a farmer may not be in doubt under the ordinary times, but under these conditions he is simply swept from the land.

Q. (By Mr. CLARKE.) That diagram is based on fluctuations in wheat only?—A. Yes; wheat. That is taken as a representative commodity.

Q. (By Mr. A. L. HARRIS.) Now you have given us the facts, the conditions; what, in your opinion, is the cause, if you have investigated the matter sufficiently to give an opinion?—A. Well, it seems to me that the first cause is the facilities for convenient and rapid transportation; that is, the high efficiency of the distributing system of farm products.

Q. Are the prices referred to on the chart at the place of consumption or at the place of production?—A. They are prices at the place of consumption; they are English prices; prices in the main consuming countries of the world. That is, the commercial wheat, wheat that passes out from one country into another.

Q. (By Mr. CLARKE.) All that great decline in the price of wheat occurred subsequently, did it not, to the enormous development of the wheat-growing sections of America and Russia, and, I believe, some other countries?—A. Yes; of America primarily. The other countries came in later; both Australia and Argentina have come in later, and the Russian export has developed somewhat later than that, but is now practically on a level with the United States. The transportation facilities, including the capacity to carry great quantities of wheat across the ocean in a single ship, as well as the facilities for carrying wheat from the wheat fields of the West to the seaboard—that, taken together, seems to me to be the most prominent agency at work in reducing the price in the consuming market of the world. Now, at the other end, the application of capital in the form of agricultural machinery, to cheap lands, cheap rich land, and hence the great increase in the production, is the other fact. The very low cost of producing a bushel of wheat has enabled the distributing system to take advantage of its position to increase to a certain extent the burden laid upon the consumer; and what New York is trying to get at now through its State commerce commission, is to find out why the wheat goes around by Montreal or Newport News or

Norfolk, or by New Orleans, and does not go through New York on its way to Europe and other countries. Well, the simple explanation is that some additional burden has been wedged in between the consumer and the producer which throws the tide of wheat movement out of the usual channel, and it always will be so; and hence the constant necessity of criticising and examining the methods by which the agricultural products are carried from the hands of the producer and put into the hands of the consumer.

Q. (By Mr. FARQUHAR.) In other words, you say that the cheap production and the cheap transportation have made a cheap market in Europe?—A. Yes; have immensely enlarged the market for our commodities. Now, the consumer is the main factor in almost all economic developments. Economic development has in mind the capacity of the consumer to buy, and if you can put the rate low enough you can put the price low enough to the consumer, and we can sell a very large proportion of the Western wheat to Japan and China; but if we can not put it low enough they will raise their own.

Q. (By Mr. A. L. HARRIS.) Has not overproduction had a great deal to do with the decline in the price of wheat in the last 25 years?—A. It has made the decline more or less permanent, made the low level in prices more or less permanent, and it took some years to correct itself. You see when Europe for a series of years has good harvests, then the demand on the American surplus is very much less, and then we have overproduced; we find ourselves in a state of overproduction, so to speak. When on the other hand the chief surplus-raising countries or any countries—the leading countries of Europe—have had a bad harvest, that draws off probably more than our surplus, and we find that we are short; that is, prices go up. That is what it means to us; they rebound immediately. There is no other place to get the wheat from. We have the position of a monopolist in that respect, because the harvest of the other great wheat-producing countries, the Argentine harvest and the Australian harvest, do not come at the same time that ours does, and we can come in at that point and feel the benefits of a partial failure of crops in Europe, and for that reason prices rebound. And that is just about the place we are in now; we are holding that position. We may be in a state of overproduction a year or two from now. If European countries have a first-class crop, or a crop a little above the average, they will buy little because they have been strained and have had to live on less than usual for the past 2 years, and they are going to demand as much as they usually have. They are eating the bread of penury to a certain extent, and a slight improvement in their crops will cause a considerable falling off in the demand for our supply.

Q. (By Mr. CLARKE.) And when the great wheat-growing country along the Trans-Siberian Railroad is developed the product will compete directly and contemporaneously with ours, will it not?—A. Yes, I think so, as far as the harvest is concerned; so that it would be possible if the Trans-Siberian railroad can handle wheat cheaper than our roads are willing to handle it, are willing to take it from Minnesota, say, or the Northwest to the Pacific coast, it is possible for the Trans-Siberian or the Siberian farmer to put grain in South America or on the Pacific coast at a lower price than it can be bought from the home producers. In other words, the conflict of the future is to be in the Pacific for the ascendancy of American agriculture.

Q. (By Mr. A. L. HARRIS.) At the present time where is the price of wheat determined?—A. What determines it—yes, at the present time.

Q. (By Mr. PHILLIPS.) It is the Liverpool market, is it not, largely?—A. Yes; that is, the Liverpool market is the meeting point of the competing supplies, and where the meeting point of competing supplies of any commodity is, there the price is fixed.

Q. (By Mr. A. L. HARRIS.) If we would raise 550,000,000 bushels of wheat in this country and have 50,000,000 bushels to export, what effect does that 50,000,000 bushels have upon the price of the remaining 500,000,000 bushels in this country?—A. That would depend on our proportion of that 50,000,000 bushels and the proportion which all other countries export—are preparing to lay down at Liverpool or anywhere else in western Europe.

Q. What I want to get at, is whether the export price controls the price in the home market.—A. Yes, if the price for the 50,000,000 bushels should develop a relative scarcity outside of the United States the price would rise. If the export price rises the domestic price would rise, because Liverpool and New York and all other places would compete for the total crop. You see my point.

Q. (By Mr. CLARKE.) At the same time, if anything should happen to cause a large decline in consumption, in the asking for wheat in this country, so as to permit a larger surplus for export, the influence on the price at the meeting point, say Liverpool, would come very largely from this country, would it not?—A. Yes;

would tend to depress the price. If you can release 100,000,000 bushels instead of 50,000,000 it would tend very much to depress the Liverpool price. If it were a larger proportion of the available supply elsewhere it would tend still more to depress the price of wheat. It is a question of proportions.

Q. It is the market of largest consumption that is the main factor in determining the price?—A. Yes; that is just putting it in another way, if I understand.

Q. (By Mr. A. L. HARRIS.) Have you anything to say in regard to the increase in acreage under cultivation in this country?—A. No; I have nothing that would add, I think, to the information of the commission.

Q. Do you care to touch upon the decline in the productiveness of the soil?—A. I may simply say this: That when agriculture reaches the point where the returns on capital and labor are declining, that unless new methods or new agencies are introduced it must result in throwing that land out of cultivation and so decrease the acreage. I am speaking of the general tendency. Now, in the East, where the productivity of the soil has declined to the point where it ceases to compete with the richer soils of the West, it has passed out of cultivation frequently until a new kind of agricultural ability came to occupy the soil, such as market gardening; and that has taken place in Massachusetts, taken place where the French Canadians and others have occupied lands; has taken place in New Jersey; has taken place in Pennsylvania, and has taken place to a great extent along the Eastern coast. So that when the decline in the productiveness, in the productive condition, of the soil is recognized as a fact that is no proof that the land is not going to be a profitable field of investment within a short period, possibly. It is a question with the farmers what kind of investment, what direction, they had better give to capital. It is very much like a man who has a lot; he is prepared to pay taxes on it and hold it out of improvement for a long time, for a considerable period, until he knows what kind of building that locality of the city is going to require. That is what I want to bring out. That land may pass out of cultivation often just because the owners of it do not know what use to put it to to make it profitable; but in the course of a few years a market may arise for a certain commodity, certain product, which will be very well adapted to that soil. That is constantly taking place in the East, and the abandoned farms of New England are coming back to that point where they are finding a market, and many of them, most of them, possibly, in some States have disappeared; such a thing does not exist. It may be that they are going to use them for stock farms. Some wealthy capitalist in the city, not simply out of fancy, but because he believes in good stock and believes good stock will pay, goes out and buys several hundred acres and makes a first-class stock farm. It answers the purpose admirably, and he gets a good return on his capital, gets as good a return as the average farmer does, and he discovers a market for first-class stock.

Q. What effect has improved machinery had to help the farmer meet the prevailing prices for farm products?—A. It has reduced his wage bill very considerably. To a certain extent he had to do it, but to a greater extent he found it profitable to do it.

Q. (By Mr. PHILLIPS.) He can cultivate a great many more acres with less labor?—A. Yes; he has the advantage of individual supervision.

Q. (By Mr. A. L. HARRIS.) Without improved machinery what would be the condition of the agriculturalist to-day?—A. Well, he would be simply farming a small farm instead of farming a large farm.

Q. Now, we come to the question of transportation. I wish you would give the commission such information as you have at hand in regard to that very important question to the farmer and, I may say, the producer and the consumer.—A. That is under 43: "Increase or decrease of transportation rates during the past 50 years." Well, I should say that the rates on agricultural products have decreased largely through the competition of the railroads for freight, and that has had the effect of enlarging the markets for the farmer, but at the same time of not greatly enhancing prices, simply because it has obliged him to compete with the surplus product of the world in his production. That comes back to the point which we had raised some time ago. From the standpoint of the producer, therefore, the decline in transportation rates has not brought much advantage. From the standpoint of the consumer it has brought immense advantage. That is, the consumer is the residuary legatee in a very large measure of the transportation developments of the last 50 years, so far as they relate to agriculture. Looking at it from the other point of view, the transportation facilities have enabled the farmer to avail himself of comforts and facilities of improvement, self-improvement, and increase in knowledge, which has probably been the main factor in enabling him to maintain a high standard of living. So much must be credited, I think, to the transportation facilities, and in that you have to include the United States mail.

Q. Have you investigated the question to any extent of the cost of distribution between the producer and the consumer of farm products?—A. I have looked into the matter to some extent in connection with English agriculture. I find, for instance, one particular fact which might indicate what might be worth recording; take milk, for example. In supplying milk to London the consumer pays the railroad about 7 per cent of the consumer's cost. As a basis for figuring I simply mention that fact. Now, what per cent is paid to the transportation companies for milk in such a city as New York I am not prepared to say, but I know that the milk trade is well organized both among producers and distributors and that the rates are matters of public record. I think in the milk trade generally that is apt to be the case. Now, in cereals the rate is enigmatical; it is a matter difficult of ascertainment. The published rate is well known and can easily be gotten at; that is a matter of record; but a special rate is not well known. I am informed by persons who work on the inside of a railway system's office that it is a common thing for a single official to have a stack of special rates as high as this table by his side, and that in auditing the work of the company and seeing that the proper rates are charged by the freight agents at different stations, and so on, that pile of specials is his main stand-by. Now, those facts it would be very difficult to get, and I can not speak from that standpoint and add any information.

Q. (By Mr. PHILLIPS.) That information that you have is recent, is it?—A. Yes; very recent.

Q. Since the passage of the interstate-commerce law?—A. As recent as last week.

Q. Can you name a person that would come here and give us information, so that we could subpoena him? It seems to be a very difficult thing to establish special rates.—A. No, I could not name you one who would give you the special rates. I could name you persons who would decline to give them to you on the ground that their livelihood depended upon not divulging the secrets of their offices.

Q. You have no doubt, from your information, that special rates do exist?—A. I have no doubt that special rates do exist.

Q. Discriminating rates?—A. Yes; discriminating rates. They are made by contract with the company for a period of months, and I have been informed by an official of the Government, himself interested in transportation, that the rates for probably the last 15 or 20 years have never been in such a chaotic condition as they are to-day.

Q. At the present time?—A. At the present time.

Q. (By Mr. RATCHFORD.) Is it your information that these special rates are given to some particular persons or firms, or are they given to all shippers?—A. Well, I have not any special information on the subject, but it depends upon the importance of the shipper, and the only thing that keeps that state of things from becoming unbearable is the fact that there is more freight than the railroads can easily handle at the present time.

Q. (By Mr. FARQUHAR.) Then why should it give any specials at all?—A. Well, simply because they want to maintain their relations.

Q. (By Mr. PHILLIPS.) Of friendship?—A. Yes.

Q. (By Mr. FARQUHAR.) Are you sure that you have not got the idea of special rates mixed up with commodity rates?—A. No. I understand that; commodity rates are, of course, special rates in the classification of special systems.

Q. That every railroad has to handle in making up its returns?—A. The rates that are published as standard rates have corresponding special rates to them which are open only to the few persons who are concerned with the business, which are known only to the few persons.

Q. (By Mr. PHILLIPS.) They keep the papers to which you allude or have reference to audit their accounts?—A. Exactly. The gentleman to whom I refer, —the maker of the rates—writes to him and says, "Please protect the rate from so and so to so and so, from such a place to such a place, on this commodity." "Please protect"—that means that we have guaranteed a special rate and we want you to figure it out on that line. That is secret; that is kept for themselves only and for the shipper; and that is only one out of that pile as high as this table of these sheets of special rates, which are wholly distinct from the established rates published and hanging in the office of the company, which the small shipper has to pay.

Q. (By Mr. FARQUHAR.) Well, take, for instance, the shipper from New York. Five great trunk lines present themselves, and this shipper selects one of them, as you say, under special rates. How long do you suppose he could get the benefit of those special rates until the other railroads found that the special was on that road alone?—A. Just as soon as they were in need of that freight.

Q. But they very naturally know among the shippers. There is a peculiar quantity that is sent out by great concerns that does not vary much each month. Now, providing they get the special, and say 80 per cent of that concern's goods went on this special line, would not the other four lines know of it inside of 80 days?—A. Certainly; but supposing the other four lines are pretty well occupied, pretty busy, are not hungering and thirsting for any more freight; they are doing all that their road can comfortably handle; my point is that as soon as those roads are in need of freight so as to maintain their earnings; as soon as they see their gross income growing smaller, they are going to enter the field as competitors for that freight and the special cutting is going to begin.

Q. When freights are light and the market has to be searched pretty thoroughly by the freight solicitors is not that generally the time, as appears by testimony before the Interstate Commerce Commission here, when the rates are cut, and when the roads are running full they do not cut?—A. No; they do not cut. The differential between Chicago and New York on the seaboard lines is practically non-operative at the present time, just because they have more freight than they can well handle; but when you come to the point where they have less freight than they can conveniently handle, then the differential will be enforced and the cutting will go on.

Q. Could you prove the special rate if the commission should ask you?—A. I could not bring anyone here to prove it. I simply state the facts.

Q. (By Mr. PHILLIPS.) Could the person to whom you alluded as having seen the stack of papers containing these special rates be obtained to give testimony?—A. No; I think not. He is a capable young business man, and he is ambitious to make a career for himself and is highly trusted; and he would not want to destroy all of his advantages. You see the position he is in.

Q. You have no doubt he was in position to know when he made such a statement?—A. He is one who does the auditing.

Q. (By Mr. KENNEDY.) I would like to ask what is the question about rate sheets, stacks of them; I did not hear that.—A. This gentleman, who is in the office of one of these lines, told me as late as last Sunday, while he was a guest at my house—he is a relative of mine, and I know he is a most truthful young man—that in his office he has a stack of special instructions, special rate sheets, as high as the table, over which he has to go a good many times a day to make sure that he is correct and that he is giving the right rate to a shipper from one point to another on that line, and that the maker of the rates constantly sends him notices, "Please protect this special rate of A to B from such a point to such a point." I think that practice is quite sufficiently clear; but it brings it a little more home possibly to state it as I have stated it.

Q. (By Mr. CLARKE.) Irrespective of this question of discriminations in the railroad business, are there any trustworthy statistics, to your knowledge, which show how much is the cost of distribution of agricultural products between the producer and the consumer?—A. There are no statistics that I know of that could be used to determine just what proportion goes to this or that portion of the distributing system, or what goes to the distributive agencies as a whole. It seems to me that the whole question would have to be worked up from the bottom.

Q. Do you think it practicable to gather such information in reference to, say, a few of the leading products?—A. It does seem to me to be entirely practicable. At any rate we could get the cost based on the standard rate—that is, the published rate—and put those results by themselves; that is, the rate that is in the book, that hangs in the office, open for public inspection of all shippers and of all persons.

I suppose such an inquiry would have to extend not merely to the rates of transportation on railroads, but also to other means of distribution in cities and suburbs?—A. Yes. Take, for instance, butter that comes from the Vermont dairy and goes to the Fifth Avenue Hotel; what per cent of the consumer's cost, the cost to the consumer, is assignable or must be assigned to transportation to the express companies or the railroad companies that bring it? Such things are ascertainable without any great difficulty. Then I cited the milk trade as a trade in which the facts could be gotten at without much difficulty; and the fruit trade—say the strawberries and various other kinds of fruits, on which there is an open rate. We could proceed, it seems to me, on that basis and get the plain published facts about the matter. Then if there are special rates we could probably discover some of them at any rate. The shippers who do not get special rates are often in a position to know what special rates are given to others, and taking those rates and fitting them between the price paid to the producer and the price which the consumer paid, we could see what proportion of advantage was given the shipper by the special rates at a given time on a given quantity of goods; and that is what, it seems to me, is worth while trying to find out.

Q. (By Mr. A. L. HARRIS.) In this cost of distribution you would have to take into consideration also the amount paid to the commission man?—A. Yes; the local buyer and the commission merchant.

Q. For storage?—A. Yes; he takes the goods from the transportation company and distributes them to the retailer, and the retailer distributes them to the consumer. We would have to find out, it seems to me, what the retailer gets at a given time at a given place, and select goods on which the depreciation in course of transportation is a small feature. You see you would have to divide your commodities into different classes, according as there is much or little depreciation in them.

(By Mr. FARQUHAR.) Perishable?—A. Perishable and imperishable.
(Testimony closed.)

WASHINGTON, D. C., January 9, 1900.

TESTIMONY OF HON. JOHN HAMILTON,

Secretary of Agriculture, State of Pennsylvania.

The commission met at 11 a. m., Vice-Chairman Phillips presiding. Hon. John Hamilton was introduced as a witness, and, after being duly sworn, testified as follows concerning agriculture:

Q. (By A. L. HARRIS.) You may state your name, your post-office address, and your occupation.—A. My name is John Hamilton; my home address is State College, Center County, Pa.; my official address is Department of Agriculture, Harrisburg, Pa.; my occupation is that of a farmer.

Q. Please describe the working of the department of agriculture in your State.—A. The department in Pennsylvania is organized very much as the National Department of Agriculture at Washington. It is officered by the secretary, who is appointed by the governor for a period of 4 years. There is a deputy secretary, who is also appointed by the governor; a dairy and food commissioner; a forestry commissioner; an economic zoologist; a veterinarian; and then the several clerks and other subordinate officers. These gentlemen are heads of their various divisions and have charge of the matters that their names, to some extent, indicate. The forestry commissioner has charge of the whole question of forestry in our State, under the direction of the secretary. The dairy and food commissioner has charge of the enforcement of the pure food laws, and also does what he can to promote the interests of our dairy industry. The economic zoologist looks after the diseases and insects that affect our crops, making investigation into their habits and giving such suggestions for the suppression of their ravages as he may be able to give. The veterinarian is in charge of the suppression and prevention of diseases of domestic animals in our State, and he also is a member of another organization known as the State live stock sanitary board, that has very large powers in the way of providing for the inspection of diseased animals, and for the quarantining of all animals that are known to have contagious diseases. The deputy secretary is, under our law, made the director of farmers' institutes, and he conducts them, organizing them in the several counties and providing certain lecturers, who appear before these meetings of our farmers with a view of giving them information in regard to the latest and most approved methods of scientific agriculture. The secretary is supposed to be the chief over all the divisions, has a supervisory control of all the division officers, and is directly in charge of the inspection of commercial fertilizers, seeing that samples are collected of such as are offered for sale in the State; that the law regulating their sale is observed; that analyses are made and the results published for the information of our agricultural people. He also has a fund given him for the making of special investigation into such matters of agricultural interest as he may see fit to select. This is, in a general way, the outline of the operation of our department.

Q. Please give a little outline of your institute work, and you may also state its importance, as you believe, to the agriculturists of your State.—A. The farmers' institutes, as I have stated, are under the immediate direction and control of the deputy secretary of agriculture. The State makes an appropriation annually for the payment of the expenses of speakers, and the rent of halls and such other matters as are connected with the proper conduct of this work.

Q. (By Mr. PHILLIPS.) By whom is the deputy appointed or selected?—A. By the governor. The deputy is an appointed officer. The appointment of the secretary must also be confirmed by the senate; that is not necessary in regard to the other officers of the Department.

The deputy secretary has committees which are made up of representatives of various county agricultural organizations, and these committees are in each county, one committee for each county. They meet upon the second Tuesday of June in each year to select the places and name the dates at which they desire to have institutes held in their county for the coming season. This year there are altogether 308 days of institute provided, and these are held between the 28th day of November and the 1st day of March, being put at the season of the year when the farmers are least occupied with their farm affairs. In order that this number of days may be put into this period, the State is divided into five districts and institutes are appointed for each district. The State provides, free of expense to the locality, three lecturers in each one of these districts. An itinerary is made out, by which the institutes are held in each section, and these three State representatives are expected to be present at every institute held in their section. The chairman of this board of representatives is chosen because of his qualifications as an intelligent practical farmer, a man able to express himself clearly, one who has had experience, and is full of energy, has got good judgment, and is well informed generally upon agricultural topics. The second man of the force is a scientific man. For the last 4 years we have been supplied with these men by the State college, which is a scientific institution organized under the land-grant act of 1862. These men are supposed to be experts in scientific matters along some line of science. The third man of these committees is a man who is selected because he has succeeded in some special line of agricultural work, and this third man is changed from time to time, exchanged for some other man who is an expert along some other line of agricultural work. The first two men—that is, the chairman and the scientific man—are not changed. They are kept through the entire season on the force, but the third man is exchanged from time to time with another who is expert along some other line, done for the purpose of giving variety and getting at practical information of the best sort on all sides of our agricultural work. The local committee, in addition to these lecturers that the State supplies, is authorized to select such persons in the neighborhood where the institute is to be held, who have succeeded along some line of agriculture, and they are invited to deliver a lecture or read a paper upon some of these lines.

We prescribe what shall be done in two sessions of these institutes. Generally they continue for two days, beginning in the afternoon of one day and ending in the evening of the second day. The evening session of the first day in every institute that is to be held in the State is devoted to the interests of the education of farmers and their children, and to that session we invite the county superintendent, school-teachers, school children, all persons who are interested in the education of country people; and the discussions are along lines that relate to the education of farmers and their children—in the interest, in fact, of our public schools. This year we prescribe a topic that must be discussed in every one of these sessions. We require our State lecturers to be prepared to give sample talks upon the methods of teaching nature study in the public school, so that school-teachers and school directors and others can see how nature study may be given in the country school. We have another session that is prescribed, that is devoted to the interest of country homes; that is a women's session. I do not know but I am going into this fuller than I ought. This women's session is very frequently officered by ladies in the neighborhood—some prominent lady selected as chairman; and many of the papers are given by ladies. The general purpose of it is to discuss such matters as relate to country homes, the care of children, the cooking of food, the science of nutrition, the decoration of homes, heating, lighting, and ventilating of country homes, flower gardening, window gardening, and all of the matters that relate to the woman's life in the country home. These are the prescribed sessions.

The other sessions are left for the local managers to indicate what they desire to have discussed, and they make up the programmes so that when our State lecturers appear for work, the programme has been made up and they can see precisely what they are expected to do. I might say also that a pamphlet is published, giving the names of the State lecturers, the local dates, and the location of all institutes that are to be held, and the topics which all the lecturers who are in the service of the State discuss, so that the local managers, in making up their programme, by referring to this publication can see precisely the line of work that each individual is capable of treating, and he is expected to select some topic from the list of topics that are put down under a given lecturer's name.

After the lecture has been delivered there is always opportunity given for any person to ask questions, and that we regard as the most important feature in our institute work. These lecturers are supposed to be experts in the particular lines on which they speak, and are to be able to stand a cross-examination upon the

part of the most critical of their audiences. We hold institutes in horticultural hall in Philadelphia, among the best florists, such as Mr. Landreth, and Mr. Lonsdale, men who understand their business. We put our men on the platform and they are expected to stand criticism from the best men that the country possesses, no matter where they come from. So the work is high grade, and the men we have are the best men we can find, and are thoroughly capable. Before any man goes on our institute force he must submit a short paper giving the history of his life, his education, and his occupation, so that we may judge, and the public may judge, as to what right he has to claim to be an instructor in any particular line of work. That little biography is published in this pamphlet that is issued, so that all our managers can see just what qualifications or what advantages these men have had for knowing about things that they are expected to teach.

Q. You may state what interests, if any, the agriculturists of your State take in the institute work.—A. The interest has been very great. The difficulty now is to secure halls out in the country of sufficient size to hold our audiences. Generally we try to get the use of the country churches. Sometimes we have to take the country schoolhouses, but as a rule the buildings that are possible to be secured are entirely inadequate to hold the audiences. Last year we reached about 60,000 farming people in our institute work.

Q. You may state whether or not, in your duties as secretary of agriculture for your State, you gather any statistics in regard to farm labor; and if so, what they are.—A. We have appointed in each of the counties of the State four gentlemen, who are our correspondents. These men are selected because of their special fitness and reliability for this work. This last year we have a report from them that gives us their judgment in regard to the prices of farm animals, some statistics in regard to crops, and others in regard to wages. I have here a statement showing the rate of wages of farm labor in Pennsylvania in 1899. It gives the maximum, the minimum, and the average. I will just explain that in our State the conditions are quite dissimilar. Wages in a county like Philadelphia or Allegheny are entirely different from wages in a county like Fulton or Pike, so that the maximum and the minimum show a great divergence in amount, but the general average is an average that we have found year by year to be pretty nearly the same.

Q. Will you state the reason for the difference of wages in these counties?—A. Philadelphia County, so far as its agriculture is concerned, employs a higher class of labor; they are market gardeners and florists, and are doing a business that requires more expensive, more expert labor, than some of those outlying counties that perhaps are mostly in forest, so that nearness to a great city implies that the labor will be better paid—more expensive.

The result for this year is given in the following table:

Statement showing rate of wages in Pennsylvania in 1899.

	Maximum.	Minimum.	Average.
Farm wages, with board (whole year).....	\$20.00	\$ 8.50	\$12.69
By the month (summer only).....	25.00	10.50	15.83
By the day, with regular work (with board).....	1.00	.50	.80
By the day, with regular work (without board).....	1.40	.75	1.11
By the month, whole year (without board).....	35.00	10.00	20.07
By the month, without board (summer months).....	40.00	11.66	23.95
By the day, with board, for transient work (when wanted, only).....	1.63	.50	1.05
Harvest wages, by the day (with board).....	2.00	.90	1.29
Household help, with board (by the week).....	3.00	1.25	1.99
Estimated cost of boarding farm hands by the day.....	.50	.15	.35

Q. (By Mr. CLARKE.) When you speak of wages by the year, "whole year," that is per month?—A. That is farm wages for the whole year per month.

Q. (By Mr. FARQUHAR.) How many days of labor does that include, the average month, simply 30 days, or 26 days per month, throughout the whole year?—A. No; it includes the 365 days of the year; the Sabbaths, of course, having very light duties.

Q. Is it predicated on the fact that they are occupied the whole of these 365 days?—A. They are occupied during this entire period.

Q. That is by hire or actual work?—A. By hire.

Q. (By Mr. RATCHFORD.) How are the averages reached?—A. The reports of the four reporters in the county are taken and averaged—added up and divided by four, giving the average for the county. Then the general average for the

State is the average of the 67 counties; that is, the sum of the reports of the 67 counties divided, of course, by 67.

Q. Do these reporters of your department reach their averages by taking the highest and lowest, without respect to the numbers?—A. Each man makes his report, giving the maximum and then giving the minimum, and the average between these is the average that he submits.

Q. The point that I wish to make clear is simply this: That there may be a greater number of men receiving the maximum rate than those receiving the minimum, or vice versa; and that being the case, of course, the average would hardly hold good, would it, unless the numbers were about equal?—A. There is no account taken of that by the reporters.

Q. (By Mr. A. L. HARRIS.) Let us understand a little further what you mean by the maximum; does that mean where you get better skill and better help? Are not farm hands, as a rule, graded according to their ability to do work and their disposition to faithful service?—A. I think there is a degree of grading; but as I explained, near our cities a more skillful, better educated class of work is required, and there the wages are correspondingly increased. In some of the remote outlying counties there is not the same demand for highly skilled labor, and there the day's wages are correspondingly small.

Q. (By Mr. RATCHFORD.) Are there any other reasons for this great fluctuation of wages?—A. I suppose there are, but I have not just in mind the exact data that would prove it.

Q. (By Mr. FARQUHAR.) Would the contiguity of other classes of employment be another reason why it is better paid?—A. It does make a difference sometimes. When you are in a manufacturing district the best class of farm labor is high priced; or where you are near a railroad line, where there is a great deal of work upon the railroad, they pay somewhat more than farmers are usually accustomed to paying. The better class of labor in the community will go where the higher wages are secured, and the farmers must content themselves with the lower grade of labor; so that it does not always raise the price of labor to the farmer.

Q. (By Mr. RATCHFORD.) Might not the productivity of the soil have something to do with it, as well as having a good market? Where a man has both, he can possibly afford to pay better wages.—A. Where he has an extra market he usually is required to pay a better rate of wages.

Q. (By Mr. FARQUHAR.) Suppose the question should be asked you: Out of 100 men employed in farm labor in the State of Pennsylvania, what is the per cent of those that obtain the highest rate and near to the highest rate, and the per cent of the 100 that get the minimum or near the minimum?—A. I have no statistics, and I know of no statistics that go to show the percentage of high-grade labor as compared with that of the lower priced labor, and I would not like to venture a statement because it would be a guess without value.

Q. (By Mr. PHILLIPS.) The different kinds of work in the harvest field, for instance, require different rates of wages, do they not?—A. There is not now the same difference in the wages of harvest hands that there used to be before the introduction of our modern machinery.

Q. (By Mr. A. L. HARRIS.) You may state whether or not farm labor is subject to a greater variation in pay than the labor in the shop on account of the farm laborer having to work by himself and exercise his own judgment and his own faithfulness to the service that he is employed in.—A. I think the effect of manufacturing establishments in the community is to take our best laborers for their use and leave us the balance, who are generally inefficient in the way of being able to do the work that these manufacturing establishments require, and that their value is pretty nearly the same everywhere; that uninformed and uneducated labor is cheap always, and that our farmers have now to do with the cheaper grade of labor and less efficient grade of labor than they used to 30 or 40 years ago.

Q. Is your farm help foreign or native as a rule?—A. Mostly native.

Q. (By Mr. FARQUHAR.) Is the average wage paid in Pennsylvania sufficient to keep a man on the farm? That is, is it inducement enough to keep them at farm work, or is labor on the farm a good deal of a makeshift until he can better himself?—A. I think, as a rule, they accept farm service because they are not in condition to go abroad and do better. There is this, however, to be said, that the precarious character of mill work and of mining has its effect in keeping men in the country districts and making them willing to accept a lower per diem wage, because of the assurance that they will have some kind of employment during the entire year, whereas the mine or the manufacturing establishment may shut down and leave the men without occupation for a period and living under quite expensive conditions. That, I think, has its effect.

Q. (By Mr. KENNEDY.) Do many negroes go into Pennsylvania during crop seasons, as is the case in New Jersey?—A. I think not, except, perhaps, in the neighborhood of cities, where berries are grown extensively; but usually these fruit districts are near cities, and children and women are employed in gathering the crop. The immigration of negro help is not very considerable in Pennsylvania.

Q. (By Mr. CLARKE.) Are the farm hands and domestic help generally treated as members of the family and seated at the table with the heads of the family and the children?—A. The Pennsylvania custom is for all the members of the family to eat together. That is the rule among the farming people.

Q. (By Mr. PHILLIPS.) Labor also?—A. The laborer takes his seat with the family as a rule.

Q. (By Mr. A. L. HARRIS.) You may state, if you please, the adaptation of the school curriculum to the needs of your agricultural people.—A. My judgment is that it is very poorly adapted to the future needs of those who are to make the country their home and farming their occupation. The ordinary country school teaches reading, writing, arithmetic, geography, some English grammar, and physiology is required now in our schools in Pennsylvania. There is not anything said or any instruction given, as a rule, upon common-sense lines that relate to the natural objects that surround these children and with which they ought to be acquainted. My feeling is that the system of education at present in the country schools of Pennsylvania tends to take scholars out of the country districts and send them into the towns and cities. The education that is given in the public schools is quite elementary, and any boy or girl desiring to secure a fair education must leave the country and go into some town where there is a high school or a better ordinary or graded school than the country affords and complete his education there. The parent is under the expense of keeping the child in the town; and the town surroundings and the education and all the influences there tend to wean the child from the home life; and the absence of the small domestic duties that the country child usually is called upon to perform tends to make them regard such things as irksome; and by the time they have finished their high-school course or gone through the normal school or college the child is about as effectually educated away from the country as it is possible to do it, even if the schools had been designed for that purpose. I think that accounts for the overpopulation of our cities and the, to some extent, taking of our people from the country into the city. My thought is that we could remedy all of this by doing what is now being done in France and Germany, and to some extent in Canada, and within the last 3 or 4 years it has been introduced into the schools of New York—the teaching of nature topics, not by way of text-book study, but from the teacher taking some natural living object in the neighborhood, a plant or an insect, and giving a little talk to the children upon its structure, character, and use, so that the child becomes interested in seeing the wonderful character of the things that are just about him.

The Cornell University is putting out what they call teachers' nature-study leaflets, 4 to 6 page leaflets, treating of a single thing; it may be a peach blossom or a honey bee or a caterpillar, and the teacher reads these over. These papers, I might say, are prepared by the best natural-science scholars that the country has, put in simple language. The teacher reads these over and is expected to talk to the scholars along that line, getting them to search for these different things that are mentioned, and write perhaps a little article upon what they see with regard to them. In Pennsylvania we are just starting the same thing. The State College is publishing now a series of nature-study leaflets and sending them out to the school-teachers in the schools, requiring the teacher, before he secures a copy on a different subject, to pass an examination upon the topic previously given, and also make some statement as to the use he has made of it in his school. In New York they are forming, in many of the country common schools, junior natural-science clubs, made up of the children in the school, with a president, a secretary, and a little organization. They collect samples of the various plants or insects that are in the neighborhood, write a description of the plant as they see it, or the insect as they see it, and then affix a number to the particular plant, and also number their paper with a corresponding set of figures, and these plants that these clubs have collected are put together in a box, and the papers written on them also put together, and sent to the Cornell University, and they are there examined and the scholars are graded upon the descriptions that they give of these several plants that they have collected. So that a great interest is being excited among the country children in nature study, getting them interested in the geography and nature history of their own neighborhood. The teachers make excursions with the children and call attention to natural objects of interest in that locality, taking up the plants, the insects, such as ordinary

butterflies, and in some instances raising plants upon the desks in the school-room. The scholars from time to time make drawings of these plants, writing descriptions of them; making their essays along these lines instead of on some abstract question; thus teaching them observation, and trying to have the young people interested in the wonderful things that are all about them, with the hope that they will stay in the country because of the attractiveness of country life.

I think that our schools ought, as rapidly as possible, to adopt this method, and the normal schools should begin at once to prepare teachers for the giving of this sort of instruction, and that the reading books that are now used in the public schools ought to have a considerable amount of the matter of which they are composed made up of the treatment of natural-science objects, so that children will become familiar, before they leave the common country school, with a great many things that the agriculturists of to-day needs to know.

Q. (By Mr. KENNEDY). Is that character of teaching given in the public schools of the State of Pennsylvania?—A. To some extent. It is anomalous in that the cities are doing more in the way of teaching nature topics than the country, and that is due to the fact that they have graded schools and their teachers are better paid and are of a higher grade.

Q. That character of instruction is given in the schools of this city.—A. Yes. The last number of the Ladies' Home Journal, I think it is, gives a full page set of illustrations of the way in which that matter is taken up here in the city of Washington, and it is very interesting.

My thought in addition is that we ought to have in our country districts township high schools to which the children who graduate in the primary school can go. The effect of this would be to keep the children in the home family and make it possible for every country child to get a fairly good education; prepare for the normal school or perhaps college right in his own neighborhood.

In our State we have a law that authorizes the establishment of country high schools of three grades, but this law, unfortunately, requires an appropriation to carry it into effect, and the appropriation has not yet been secured. The law provides that where a two-year course is established in the township high school they shall have \$400 from the State fund; where a three-year course is provided, \$600; a four-year course, \$800. That is the maximum, but we have been unable, so far, to secure the appropriation necessary to carry this into effect, as I have said.

I believe that the most important thing, after the introduction of this nature study into the schools, is the township graded and high schools, so that country children can be educated in the country, be kept in contact with their home people, their home duties, and so be protected from town influence and from town life until they become of sufficient age to understand the relative values of different kinds of life.

Q. (By Mr. A. L. HARRIS.) Are there any States in the Union that have adopted this county high-school system?—A. No State as a State, so far as I know. Ohio has several schools. I think down about Cheshire, in southern Ohio, there is one, and we have in Pennsylvania several township high schools, but not under the State law, simply the result of local enterprise.

Q. (By Mr. CLARKE.) Some of the New England States have them.—A. Massachusetts has them, and in Massachusetts out of a certain radius, outside of a certain zone, they collect the scholars and bring them to the school at the township expense and return them to their homes.

Q. (By Mr. A. L. HARRIS.) Have you made the taxation of agricultural property a study; and if so, will you please give the commission the results of your investigation?—A. I have given the subject, so far as it relates to Pennsylvania, a good deal of attention. It has been several years since I made a thorough examination of the system as we have it in our State, and since that time there have been several modifications in items, but the general system remains the same as it was along about 1890. The system as we have it in Pennsylvania provides for the maintenance of three departments of State government: one is the State itself, another is the county, and the last are the city and borough and township divisions. The taxes that are necessary to meet the expenses of the State are derived mostly from corporations and from money at interest and license fees. The taxes that support the county government are levied upon real estate and upon farm animals, and the taxes that go to support the township government are levied upon real estate and farm animals. In the levying of these the method is to assess the property by assessors who are elected under the law, and this valuation is submitted to the county commissioners and revised by them after opportunity for appeal by the taxpayer is had. Duplicates are made out and put into the hands of tax collectors, who proceed to collect the several taxes with

which they are charged. The board of road supervisors fix the amount of tax that shall be levied for roads. They are township officers. The board of school directors fix the amount of tax that shall be levied for school purposes. They are also township officers. The board of overseers of the poor fix the amount of tax that shall be levied for the care of the poor, and they are township officers. So the township is maintained by taxes that are levied by themselves and the rates are fixed by themselves.

Q. (By Mr. CLARKE.) By their own officers?—A. Their own officers.

Q. The people do not vote themselves on the amount of the tax?—A. No; it is fixed by the officers whom they elect in their localities. Each locality fixes the amount of tax in these several directions, and the taxes are levied upon real estate, as I have said, and upon farm animals, horses, and cattle, 4 years of age; dogs, also, are taxed a small tax.

Q. (By Mr. A. L. HARRIS.) Is that a head tax on dogs?—A. Yes; and the tax on dogs goes for the reimbursement of persons whose sheep have been killed, where it is impossible to find out whose dog did the killing.

Q. You do not tax the intangible property, then, for any purpose?—A. There is an occupation tax that is levied upon citizens; but under our constitution that tax, indeed all taxes, must be upon classes of property, and occupations have to be classified; so that teachers are in one class, and ministers are in another class, and lawyers are in another class. The assessment of the occupation therefore is not according to the man's income at all or his standing as a man of capital, but must be low enough that a man who receives the smallest salary in his class can be able to pay the fee, pay the tax. For instance, a lawyer—I will just read an actual instance. Here is one county: lawyers are put down at \$250.

Q. (By Mr. CLARKE.) Income?—A. No; that is their standing for taxation purposes. Now, if his income is \$10,000 or \$20,000 all he is taxed upon is \$250; and if the millage is a .001-mill rate, he is taxed 25 cents, although his income may be \$10,000; and it is not made any larger, under the assumption that the constitution forbids taxing outside of a classification; and therefore the classification, the tax, the assessment must be small enough to make it possible for the most impecunious lawyer to pay it.

Q. (By Mr. RATCHORD.) Now, in that case the \$250 is only a tax on his profession; it does not reach anything else, any possessions he may have?—A. No; just his profession.

Q. (By Mr. CLARKE.) How long has that law been in existence?—A. Our new constitution went into effect in 1874. Physicians in this county to which I refer are taxed at \$200; ministers at \$75; county superintendents at \$250; professors of colleges and academies at \$250; superintendents of high schools at \$200; common-school teachers at \$50; merchants at \$200; shopkeepers at \$100; clerks at \$100; mechanics at \$100; apprentices at \$50; bosses and foremen at \$75; civil engineers at \$250; surveyors at \$150; bank presidents at \$400; bank cashiers at \$250; county officers at \$250; president judge at \$300. The law gives the president judge a salary of \$4,000 in our State. Farmers do not pay an occupation tax in Pennsylvania.

Q. (By Mr. FARQUHAR.) How much does the occupation tax amount to annually?—A. I can not give you that. The townships differ in their ratings of real estate very materially, according to the judgment of the assessors who make the valuation. I have known of a property, divided by the township line, where one part was assessed at double the value of the other, and yet, in the market, they are as nearly alike as possible. The system of valuation is a very imperfect one, and, although the law requires that the assessment shall be made upon the cash value of the property, the rule varies from one-fourth to more than the property is worth, according to the judgment or want of judgment of the persons who make the assessment; and the tax rate differs according to the pleasure of these several boards in the township. It may reach 80 mills; it may be only 8 or 4 mills, as the different boards desire. The county rate, used for county expenses, as distinguished from township, is fixed by the board of county commissioners, and usually is from a 3 to 5 mill tax upon all property that is assessed for township purposes. The State taxes are fixed by statute. I suppose it is impracticable to at this time go over the list of items that are taxed for State purposes and give the particular method that is used for each. As I stated, the general system is to tax corporations of all kinds, money at interest, and licenses and fees from the county offices for State use; and our State returns to the counties three-fourths of the whole amount that is received from personal property taxation, money at interest; one-fourth is reserved for State use.

Q. (By Mr. CLARKE.) When are the assessments by the local boards made up, before the amount derivable from the tax is known or afterwards?—A. The

assessments on real estate are made once in three years. I believe that is about the only answer I can make.

Q. What I wanted to draw out was this: how can the highway commissioners and the commissioners of the schools and the commissioners of the poor know exactly how much they can have?—A. They make up their estimate and levy their tax upon the preceding assessment. For instance, if the assessment is made this year, the school directors, who have to meet the expenses of the schools before the new tax is levied, levy their tax upon the basis of the levy of the preceding years.

Q. There is no limit, then, to what they may see fit to impose?—A. Yes, there is a limit. The 10-mill tax is a limit for school purposes, excepting special taxes that may be levied for building purposes; for ordinary school purposes a 10-mill tax is all that is allowed. That is true also with regards to roads, but the supervisors of roads can get around that requirement by running the township into debt to any extent, and their successors must pay that debt; and they have authority then to levy an additional tax sufficient to pay the debt.

Q. The only restraint upon them, therefore, is their desire to maintain good standing with the people?—A. That is the only practical restraint. As to the relative amounts of tax that different kinds of property pay in our State, examination was made a number of years ago by the department of agriculture to try and get some reliable information on that point. It was alleged by some that the tax on the farm property of the State was very much greater than upon any other kind of property. In making that investigation the department had a large number of persons visit the various county towns and consult the records, getting at actual sales of farm property and sales of city property and town property, seeing also the amount of tax that was levied against each on the records in the county town. In 1890 Secretary Edge, of the Pennsylvania State board of agriculture, collected statistics from actual sales of farm property in the State of Pennsylvania showing the amount of those sales and the tax that was paid by each piece of property. The total number of farms returned was 556 in 48 counties. These farms had been sold for \$4,225,805; the tax paid by them was \$40,282.65. The rates in actual value, not deducting the personal property tax, which is simply a tax upon farm animals over 4 years of age, and is comparatively insignificant, was 9½ mills, and after deducting the personal property was 8.06 mills. I made an examination at that same time of a county, omitting the boroughs, and found that the taxation upon the actual value of the property in the county outside of the boroughs, and including horses and cattle, was 9.9 mills. This examination was continued in 1891, and then the secretary of the State board of agriculture collected statistics upon 8,081 farms, and the estimated value of these farms amounted to \$51,525,929, and the total amount of tax paid by farms on the list was \$440,317.96. In 1894 the number was increased on the list to 19,719 farms, and in 1895 that was still further increased to 24,734 farms. The total value of these farms is given at \$151,529,458, and the total tax paid on the farms on the list amounted to \$1,259,847.17, which would make a millage of 8.3 mills on farm property. An examination that was made about that same time upon a different method shows that real estate in Pennsylvania at that time paid about 15 mills; real estate, counting country and city and town, paid about 15 mills of taxation. These figures show that farm property paid between 9 and 10 mills of tax, and the figures are, I believe, as accurate as we can get; they were very carefully secured. Of course, the amount varies in different localities. As I stated at the outset, some townships levy a tax of not more than 5 mills, perhaps 3 mills, and other townships levy a tax of as much as 80 mills; but these figures that I have been giving are the average for the entire State for a given year. The matter of the amount of taxes that real estate shall pay is wholly within the power of the local authorities within the township, with the exception of the county levy, which is usually from 3 to 4, and not often more than 5, mills. That is in the hands of the county commissioners. So that the control of the amount of tax that farmers shall pay in their community is within their own hands absolutely; they can have a low rate or a high rate, as they see fit.

Q. You think that is a good system?—A. I believe it is a good system. It has the advantage of being flexible, so that the peculiar requirements of a locality can be met by the people of that locality. If the expenses are very great or the necessities are very great, the people can levy more tax. If things are in good condition, a smaller tax answers their purpose. There is no hard and fast rule by which every township is required to levy the same amount of tax, but it leaves that to the judgment of the local people.

Q. (By Mr. PHILLIPS.) How does this tax on farms compare with the whole tax of the State on other matters?—A. In the year that this examination was made

the amount of State tax was something over eight millions. The auditor-general's report for the year 1889 gave the total amount of State tax at \$8,182,847.84. The expenses of government for that year amounted to \$40,007,649.12, so that \$31,824,801.78 would be left as the amount that real estate raised. Real estate, including the farm animals taxed, raised about \$34,000,000 as against all of the other taxation of the State, which amounted to something over \$8,000,000. I think the proportion has not been very greatly disturbed or changed by enactment since that time. There have been some slight changes. The 3 mills State tax has been increased to 4 now, and there is some little change in the taxation upon our transportation companies; that has been raised slightly, but these are practically the relative amounts that are raised by real estate and corporation and other property.

Q. Have you the facts in regard to the value of real estate in Pennsylvania as compared with other values, personal and other properties?—A. No; not at hand.

Q. Then, in your judgment, does real estate bear entirely too much in proportion to what is collected from other matters, so far as the whole government is concerned?—A. I think that it does. I do not mean thereby to say that real estate is taxed too much, but that some other things are taxed too little.

Q. (By Mr. KENNEDY.) Does not that mean, after all, that it is taxed too much?—A. By that I mean that it is not taxed to the extent of driving the business out of business. That I would regard as being too much tax; but the amount of tax that it pays would be very greatly lessened if a proper tax were put upon other items. When the Government was first founded most of the citizens were owners and employers, but with the advance of civilization and the incoming of great corporations and other institutions and immense development of private business, most of our people are employed and receive salaries. Some of these salaries are very large, and, as I indicated in going over the matter of assessment of salaried people, the amount of their tax, according to their assessment, is so out of proportion to the amount that they receive that it is almost nothing. I know of men who get salaries of \$5,000 a year who pay a road tax of 75 cents; and a man living in a little log house, with one arm, and a common day laborer, who must depend upon his own services for the support of his family, and in the same community, pays a road tax of \$1.80. There are judges of courts who get salaries ranging from \$4,000 to \$5,000 who pay a tax upon \$300, and a man who owns a house worth \$2,900 or \$3,000 will be taxed upon the full value of that property, although he may have no income whatever, and may be in debt for eight-tenths of that house.

Q. (By Mr. CLARKE.) Is there no exemption for debts?—A. None whatever.

Q. (By Mr. RATCHFORD.) A tax on the profession in effect is a tax upon income?—A. Well, it is a tax upon the profession. There are clerks, mine men, mill men, getting salaries anywhere from \$1,000 to \$10,000 a year—and the number is very large—who pay almost no tax. Merchants who have large business pay scarcely any tax on their occupation in our State. If the occupations were rated according to the amount that the real estate holder receives upon his investment the tax receipts for our State would be tripled, in my judgment, and the tax would come upon people who are able to pay it and have the money. The tax upon farm property, say a 10-mill tax upon a farm worth \$8,000, is \$800 a year. The farmer's income from that investment, after his own labor is paid, will perhaps not be over \$300, if it is that much, and upon that \$300, therefore, he is paying a tax of \$60, because the tax must come out of that fund; and if his income is nothing whatever—if there is a failure of crops—then his tax must come out of the original property unless he has other funds from which to pay it. The salaried man, getting a salary of \$5,000 a year, we will say, as a judge, would pay on a 10-mill tax on his occupation, \$3 as against the real estate holder in the country whose income is merely \$300 paying \$60. The inequality is so marked and the injustice of it is so clear that I feel that we are neglecting our duty in not calling the attention of the public to it.

Q. (By Mr. A. L. HARRIS.) Does this condition of affairs come from your constitution of 1874?—A. I think that that is made the excuse for part of it, but we find that when we want to do a thing we can generally get a way. For instance, our constitution says that all things shall be taxed in classes, and we go to work and reclassify our cities, and we accordingly have cities of the first class, and cities of the second class, and cities of the third class. There is only one city of the first class in our State, and so legislation is made for that particular city because it is put in a class by itself. Now, I think it would be possible to classify attorneys into those who have a business of so much and others who have a business of so much, if we want to do it; but the pressure is the other way. I speak of attorneys just as an example. We may take the salaried men, men in the professions,

I do not care in what line, those who get salaries of so much should be rated at a certain rate, and we could have classifications running so as to divide up what are now single classifications, if we desired to do it.

Q. Are we to understand that under your law, until a man with a high salary invests in real estate he is substantially exempt from taxation?—A. Yes, or puts it in a mortgage; then he must pay 4 mills. If I invest in our State \$10,000 in a mortgage on a farm, I pay on that investment a 4-mill tax to the State. The farmer who perhaps borrowed the money will also pay upon that same amount his local tax, which runs anywhere from—well, it is an average, as I said, of 10 mills, so that that particular money is taxed 14 mills.

Q. (By Mr. RATCHFORD.) According to that, the farmer is paying a tax upon his debts?—A. He pays a tax on his debts; that is what he does.

Q. Now, reverting, if you will, to the illustration made between the farmer and the salaried man, I would like to get some more light on this subject. If the salaried man's profession is not taxed, his money is invested in real property or personal property, otherwise it is in the banks in the form of money or in stocks of some kind. In either case he is supposed to pay taxes on it; according to law he is bound to pay taxes on it; is that not right?—A. Yes; excepting the deposits in banks.

Q. Well, is it found that personal property is pretty generally taxed and paid for according to its value?—A. The law is that this money that is invested in a mortgage shall pay a 4-mill tax, but, as I stated, the man who borrowed the money, if he is a farmer, must pay his full local and county tax on that same money; so that the man who has money, the salaried man who invests his salary in a mortgage on a farm, pays a 4-mill tax. If he takes that money and puts it into a farm he will pay a 10-mill tax. The effect of that is to keep men from buying, from putting their money into a farm in its purchase, and rather to lend money to somebody who has a farm, and so get rid of paying about 6 mills of tax.

Q. I speak mainly of money that is invested; of money that is largely in the form of personal property?—A. We have no personal property tax in Pennsylvania excepting bonds, and mortgages, and securities bearing interest, agreements bearing interest, articles of agreement bearing interest, and trust bonds, and horses, and cattle.

Q. You have no tax upon valuable household furniture, jewels, diamonds, etc.?—A. No; we have nothing of that sort.

Q. Do you consider it just to have the lawyer, and the college professor, and the bank cashier placed on an equality for purposes of taxation?—A. I think the whole thing is an injustice and an inequality. There are professors, and there are bank cashiers, and there are lawyers who ought not to be taxed on an occupation of over \$200. There are others in all these professions who ought to be taxed on an occupation of \$10,000.

Q. (By Mr. FARQUHAR.) From what you have explained, this tax is simply a head tax?—A. It amounts to that. It is hardly that. It is hardly to be dignified with the name of a tax. It is a farce, simply a burlesque on taxation.

Q. I would like to know how long it has been in existence, this system of capitation tax?—A. Well, it is not a capitation tax; it is supposed to be equitable. [Laughter.] Some features of it for many years, and some other features of it since 1874; but the inequality of it was not so great when most of our people lived in the country.

Q. And you were all alike?—A. And we were all alike. As it is now, a good many men are living upon salaries and a great many of them have gone into professional life and into occupations that are very remunerative, and the system has not been adjusted to meet these new conditions, so as to tax these people who are the most well to do of all our citizens. They still make real estate bear the burdens of the Government, which was an equitable thing at the origin of the Government, but has become inequitable as the productive power of our country has changed from real estate into brains and ability.

Q. In other words, the taxation has not kept step with the civilization?—A. No. (After a recess from 12.55 to 2 p. m., the hearing of Mr. Hamilton was resumed, as follows.)

Q. (By Mr. A. L. HARRIS.) Before you proceed to your suggestions as to remedies, will you make a little clearer to the commission the amount of money raised for local purposes, and the amount of money raised for State purposes?—A. The total amount of real estate as given by the secretary of internal affairs in his report for 1889 was \$2,121,638,452; a 15-mill tax on this would therefore be \$31,824,801.78, which represents the expenses of local government for 1889. The expenses of the State government for 1889 were, as per the auditor-general's report, \$3,182,847.34; making a total of \$40,007,649.12 as the expense of local and State government for that year.

Q. That amount has increased somewhat in later years?—A. Very much. The annual revenues for State purposes now amount to over twelve millions, and the relative proportion, I think, is maintained, although I can not state positively, having made no accurate examination since that date.

Q. (By Mr. FARQUHAR.) From what sources are the State revenues derived?—A. From collateral inheritances, mercantile licenses, taxes on corporations, from money at interest, bonds, mortgages, and securities, notes, articles of agreement bearing interest, license fees paid to county officials for recording, and similar work there, etc.

Q. Is the larger amount derived from the corporations?—A. I dislike to answer that, because I can not answer accurately. My impression is that it is, and yet I can not say just how much. I could easily discover. It is a very simple matter.

Q. (By Mr. A. L. HARRIS.) Please explain how you arrive at your tax on corporations?—A. Each corporation is required to make a sworn report to the auditor-general of the State, and that gives the capital stock and bonded debt, and other items which explain the commercial standing of the corporation in the State, and the amount of tax that they pay into the State treasury, so that it is a simple matter to go over the auditor-general's report and find out precisely the amount of money that they pay into the State treasury annually.

Q. Are your transportation corporations and industrial corporations upon the same footing?—A. In what respect?

Q. In the amount of tax they pay.—A. Manufacturing establishments in our State pay no tax. They pay tax upon their real estate, but not upon their business nor their machinery.

Q. Same as an individual?—A. Very much the same.

Q. In reaching the amount you collect from your railroads, how do you arrive at that?—A. By going over the auditor-general's report, and separating that from the others; they are given as separate.

Q. The gross receipts, or net receipts?—A. The tax has been changed within a few years. The tax was upon capital stock, and upon gross receipts for traffic wholly within the State. I do not know just what it is now.

Q. Do the home corporations and the foreign corporations pay upon the same basis exactly?—A. No.

Q. Will you state the difference?—A. The discrimination is against the foreign corporation. A domestic insurance company used to pay 3 mills on the actual value of the capital stock, and 8 mills on gross premiums, and 4 mills on mortgages. A mutual insurance company paid 8 mills on gross premiums, and a foreign insurance company 20 mills on gross premiums, on business in the State. There has been some modification of that, with which I am not quite familiar.

One of the difficulties in our system in Pennsylvania is in the method of assessment in the several districts. The officers who make this assessment are elected, and frequently their intention as to what they will do if elected, in the way of raising the valuation or lowering the old valuation, is known and becomes a part of the political canvass for election, so that in many cases it is understood in advance that a candidate, if elected, will lower valuations, or if there are large property interests in a locality, held in the hands of comparatively few persons, and the large majority of voters are men holding small amounts of property, then the chances are that the pledge will be made that values shall be raised, because the burden of tax will then fall upon a few large property holders, and so make it to the advantage of the large majority who have but very little property to have a man who will raise valuations. That causes inequality in various districts and injustice. My thought is that these officers should be appointed, say three assessors be appointed by the court and selected because of their good judgment and integrity (just three to be appointed in each township), to make the assessment of property in the township and make out their returns; then have one man from each of these boards meet together and revise the assessment throughout that county, so as to see that no great inequality exists between the assessments in the various townships. These men are thoroughly familiar with the value of property and would make a board of revision. At present, the county commissioners have that power. They have no knowledge of the situation in the various localities, and any revision that they make must be largely arbitrary without accurate knowledge, but if these several lists from the different townships were brought up and passed upon by all of the men who have made the assessments, there is probability that there would be a more just equalization. That report, then, as revised, should be final, and be turned over to the county commissioners. Then provide for an appeal in each of the townships, so that individuals who may be aggrieved for any cause, because of overvaluation of their property, could have an opportunity to be heard before the board of county commissioners. But there should also appear before the board at the same time the board of assessors

who conducted the assessment, so that when the individual makes his representation to this board the assessors will be there to give reasons, if any exist, why the original rating should stand. The board of commissioners become a jury, hearing the evidence on both sides from the parties interested, and their judgment is likely to be just, after full information from the parties who are best informed. This would, I think, tend to prevent the inequality that now exists in the original assessment of taxes.

With regard to what ought to constitute an equitable system of taxation, my views, perhaps, are a little radical.

Q. We would be very glad to hear them.—A. The aim in levying tax should be to make it equitable, bearing equally upon all citizens, according to their ability to bear the burden, and any arbitrary method that only takes cognizance of things they see without investigating into their conditions is likely to be unjust. There are certain things that I think ought to be wholly exempt from taxation in any State.

Q. Will you please name them?—A. All churches, meetinghouses, and other places of stated religious worship, all universities, colleges, academies, school-houses belonging to any county, borough, or school district, or incorporated, erected, endowed or established by virtue of any law of the Commonwealth, with the grounds thereunto annexed not exceeding 10 acres; also all burial lots, and lands and premises of all cemetery companies where such property is held in trust for the sole purpose of improving said lands and premises, and whose revenues of whatsoever kind are devoted to that object and in no way inure to the benefit or profit of the corporators, or any of them; also all lunatic asylums, almshouses, poorhouses, houses of refuge, penitentiaries, and asylums, schools and hospitals supported by the appropriations annually made thereunto by the Commonwealth, together with all lands attached to the same; also all charitable institutions provided by charitable gifts or otherwise, the chief revenues for the support of which are derived from voluntary contributions, together with the lands attached to the same.

It is perhaps enough to state in favor of this exemption that a tax on these would be in discouragement of religion, morality, and education in the State, and in restraint of the exercise of the practical charity that is so beneficial to, and cares for so many of the unfortunate and helpless in our midst.

Q. When you say churches, do you mean all church property?—A. Church property that is held for church purposes. Not property that would be owned and rented out for income, but that is held strictly for church purposes, the parsonage and church buildings, and the chapel that is attached to it, or the Sunday-school room.

Q. Trinity Church in New York have a great deal of property, and every other city has property laying around the city not used for church purposes.—A. I think, where not used for church purposes, it is liable for tax the same as other property.

Q. Is any of this property you have mentioned taxed in Pennsylvania now?—A. No. I also think that there should be exempt from tax implements of one's trade or occupation, carriages for personal use, furniture, watches, wearing apparel, books, jewelry, gold and silver plate, and works of art, on the principle that property that is naturally unproductive should not be taxed. No citizen can, with any show of justice, seriously object to paying his fair share of tax on his income-producing property, but when taxes are assessed on property that not only is incapable of production, but is a source of continual expense to its possessors, the tax becomes oppressive and is equivalent to confiscation. The items that I have mentioned are not income-producing capital, and yet they are important and even necessary parts of the equipment of every comfortable home. To tax these, therefore, is to lay hold of them piece by piece, until the entire list is confiscated by the State.

Another and entirely equitable reason why these articles should not be taxed is found in that principle of public policy which encourages the population of a country to provide themselves with comfortable homes. There can be no civilization worthy of the name so long as the inhabitants of a country live in squalor, like the nomadic tribes, and are restricted to the use of only the crudest implements and the fewest forms of comfort.

The State does well to protect the bric-a-brac and window garden of the housewife from the hand of the gatherer of tax, and give fond parents a chance to adorn their homes and save their growing boys and girls from the allurements of the saloons of vice.

The equitable principle that I think should control our laws in assessing and collecting tax is the one that I have partly stated; that all property naturally unproductive should not pay tax, and all income producing property, profession,

trade, occupation, and industry, including franchises of corporations, licenses, charters and commissions, should be assessed and required to pay their share of tax. The amount of tax that each should pay should be according to his net income or profit, and profits should consist of gross earnings less the necessary expense of operating the business.

Q. (By Mr. RATCHFORD.) Under that principle would the home be exempt from taxation? A home is unproductive, is it not?—A. Not naturally unproductive. It is such a thing as can be rented and will produce an income for its possessor.

Q. Is it not also true that a man can rent his carriage?—A. Not as a rule; it is not a rentable article; but where they are held for rent they ought to be taxed.

Q. The home is used for private purposes, just as a man's carriage would be used, according to the principles set down by you, and his furniture, and all these things that go to adorn the home and make the home comfortable. We will assume that the home is used for the same purpose, private purposes. Is it to be understood that under that principle you would favor taxation of the home, or would you exempt it?—A. I would do just what I have said; all naturally unproductive property should be exempt from tax. That which is capable of production should pay tax. A man's watch should not pay tax; it is naturally unproductive, and yet it has become a part of his necessary equipment; clothing, his hat, his cloak, the blankets upon his bed, dishes upon his table; those things that every man needs and that require expense to maintain, instead of their being a source of revenue to him, should be exempt from tax; but property, like a house, or a building of any kind that may be rented, should be taxed.

Q. Well, is it not a fact that none of those things of which you speak are as absolutely a necessity as the home; is a watch, carriage, or any of those things that you have enumerated? And also is it not a fact that the watch and the carriage can be made a source of revenue equally as the home can, if the possessor desires to dispose of them or rent them?—A. When he keeps them for hire, they should be taxed; where they produce income. The keeper of a livery stable; the seller of watches and clocks and jewelry, in the jewelry store; but where they go into a private home for the use of the possessor, not for rent, my judgment is that they are nonincome-producing property, and therefore should be exempt.

Q. The livery stable, and the store selling clocks and watches, are in much the same position as the man who has several tenement houses to rent. I have not such a person in mind. I have in mind a man who has only one home in which he lives and in which, perhaps, his lifetime savings are invested. He builds it for the purpose of living in it, yet if it suits his convenience he may dispose of it either by rent or sale, as he would his watch or his carriage.—A. If a man sells his watch or sells his carriage and invests his money in income producing property, such as a garden or farm, then he ought to pay tax upon it, because it becomes income-producing; but so long as it is invested in dead capital, that is naturally unproductive. My position is that he should be exempt on the ground that to tax him is to confiscate the property, and the object of the State should be to enrich her citizens. The State becomes wealthy as her citizens are wealthy and well to do, and anything that impoverishes the citizens is a detriment to the State. A State, therefore can not afford to require an individual to pay a tax greater than the producing power of the property; to take an absolutely unproductive property, as furniture in a widow's home; a tax on that will take a chair this year, when she has no outside income, and next year it takes another article of furniture, unless she has some means by which she can pay the tax gathered outside of this particular kind of property she possesses. In the case of the house, she can go and live with somebody and rent hers, or she can sell the house and invest the money in income-producing property naturally. Now, in the case of the vacant lot, that is unproductive. It is hardly absolutely unproductive in law, but I would rate that according to its producing power. For instance, the assessment valuation taken 10 years ago and the valuation taken to-day might be divided by ten to get at its income-producing power per year, and that income ought not to be wholly taken, or certainly not more than that income should be taken by the taxgatherer because anything else means confiscation. On the other hand, the tax ought to be such that a portion of the income would be left to the possessor as a recompense, in the way of interest, so that he can be induced to keep his money in that kind of property, and so ultimately make it highly productive; in other words, the State can not, under equitable or business principles, tax a piece of property to such an extent that it takes a portion of that property to pay the tax.

Q. Your conclusions, then, are that industrial and land values, perhaps, summed up in that language, should bear the burdens of taxation?—A. Industries, professions, trades, occupations, franchises, privileges, and everything that is valuable and that produces income should pay tax.

Q. (By Mr. FARQUHAR.) In your non producing property, would you apply the same rule to the undeveloped mining property?—A. My thought is that I would do with that as in the case of the vacant lot; estimate its valuation a series of years previously and its value to-day; find out its average producing power during the years, and let that be a basis then for the levying of tax. The individual can not afford to pay a high tax if it has been undeveloped—it lies dormant until some future period. Whenever it is developed the State will get the advantage of the tax; and the same is true of wood lands.

Q. Do you take into account the natural increment that goes to undeveloped property?—A. Yes; I think that is included in this system of valuation. If it were worth \$100 10 years ago, and to-day it is worth \$1,000, I think that that increment of value appears in this division into tenths that I suggested, or any other division.

Q. (By Mr. CLARKE.) Would you tax a lot on its present valuation or former valuation?—A. The general principle is that the man who is a capitalist is entitled to interest on his money wherever it is invested, and there ought to be an inducement for a man to invest his money in some kind of property. Say a lot was worth \$100 10 years ago, and was worth \$1,000 now; that would be an increase at the rate of \$100 a year. Now, that \$100 is 5 per cent interest on \$2,000. I will take that. You would rate the lot according to this new valuation, of which 100 is 5 per cent.

Q. Suppose the owner of that lot is holding it for a high price to prevent people from building upon it, who would be very glad to pay a reasonable price and cover it with valuable property which would yield a revenue to the public. Would you indulge the owner in holding that at a low rate of valuation for a high price at some future period?—A. I would wait until he would die—the State is perpetual—rather than do a wrong.

Q. Why not appraise that according to the value of similar property all around it, and tax it right along from day to day?—A. You are taking a piece of comparatively unproductive property and putting on it a value the interest of which it will not possibly pay, and so are confiscating the property. Why is it not fair to put your own valuation on it now, and compare it with the value of 10 years ago, and let that valuation be the rate of increase that the property is bringing, rather than to take it suddenly, and put your valuation upon the last and highest possible amount, compelling the man to sell? It may be his only possession, and he may have no outside income from which to pay this tax, and it becomes confiscation.

I have in mind a case of a man who was one of the wealthiest men in our State, who owned a large amount of real estate near the city; it was in farm property. Improvements were run out there against his consent, and it resulted in a practical confiscation of the man's entire property to pay for these public improvements, and the answer to his protests was "sell out."

Mr. FARQUHAR. Or die.

The WITNESS. He did die, but he died poor.

Q. (By Mr. CLARKE.) Why did he not sell and die rich?—A. That was his individual right that he exercised; to prefer to hold it cheap for his own purposes, which the State had no right to confiscate without recompense.

Q. (By Mr. RATCHFORD.) You speak of exempting the comforts of the home, including furniture, jewelry, etc., and other things tending to make the home cheerful and happy and thus encourage the building up of those comforts. Where is the harmony between doing that on the one hand and levying a tax upon the lawyer, or the teacher, professor, whose salary supplies those home comforts? Is that not direct discouragement of what we are trying to encourage?—A. The tax that is levied upon the productive power of the individual is a tax upon income-producing property; a lawyer's skill or the minister's extraordinary power to present matters in such a way that he gets a call to a \$10,000 position—has capital in his intellectual ability; or it may be manual skill, as in the case of a tradesman; that is his income-producing property, just as an acre of limestone land, or a house that is rented in the city or country, and should be taxed. It is naturally productive. The other is not naturally productive. I do not seem to make the distinction clear, but the distinguishing feature is in whether it is naturally productive or not. The question is, is it naturally productive or unproductive, on the ground that the State can not afford to confiscate an individual's property. The assumption is that no individual will put money into unproductive property to a greater degree than his circumstances warrant, and he ought to be protected in his desire to make investments for the good of himself and for the advancement of civilization without having it confiscated for tax.

Q. If a man is called to fill a position that pays a salary of \$10,000, and the State

sees fit to levy a tax upon it, does it not levy a tax upon the income of \$10,000 rather than upon \$250?—A. It certainly does.

Q. In case a man is capable of filling a \$10,000 position, but can not get any at all, then what?—A. Then he would not be taxed, except a nominal tax to keep him recognized as an individual; that is all. You can not afford to put a man by law in the poorhouse or in the debtor's court.

Q. (By Mr. CLARKE.) Should not the principle of equality govern in any tax system, so far as it might be practicable; that is, that individuals possessing a certain amount of property or income, also institutions, should be taxed somewhere nearly alike?—A. It depends upon the character of the institution, in my judgment. If the institution, as I have indicated, is wholly devoted to the advantage of the general public, such as a hospital or a public school, I think it should not be taxed, because it does not produce revenue for the benefit of any individual; but if it is a private school run for the enrichment of the individual, then I think it should pay tax.

Q. Well, take the case of two churches; suppose there is a church of 500 members, an old church in the business section of the city, the land upon which it stands having become very valuable for business purposes if it could be so used. There is another church in a distant part of the city with 1,500 members, and valued at \$200,000. Is there not a gross inequality in exempting those two churches? Is not the exemption of one from taxation the taxation of another?—A. I should think not; and I do not see who is injured by the fact that one is worth more than the other, inasmuch as both are unproductive so far as revenues that are to go into business are concerned. They are eleemosynary in character; they are for the moral improvement rather than for the commercial advantage of the community.

Q. Suppose on that very principle that both were appraised at their market value and taxed upon that. Is it not probable that the rich old church in the center of the business section of the city would sell its property and build a new church nearer the residence of its members, which would cost a great deal less money, but answer the purpose just as well—perhaps better—and thus leave its present site for the development of business, whereby the public would be a gainer in a financial sense?—A. I think that this tax that would be levied would have to come from people who are already paying voluntarily for the improvement of the community, without any hope of return in a financial way, a sufficient tax in the way of compensation to the minister, and for the support of the moral and religious institutions connected with that organization, and for the State to go in and impose an additional tax would be in discouragement of men who are already voluntarily—without any special advantage to themselves—certainly not money advantage—paying a large amount of their income. No matter what the ultimate advantage of having that lot might be to some business men, the State can not afford to go and impose upon a class of its best citizens and compel them to move when they do not want to do it.

Q. Suppose every citizen in a community is a contributor to a church. One man is a contributor to the modest and convenient church, and another to an extravagant church, occupying a site that ought not to be occupied by a church any longer. Now, is there not an inequality introduced between those two men, both contributing to the maintenance of the same good cause?—A. There is an inequality between any two men who contribute to the same cause, but contribute in different amounts in the same church. It is not necessary to carry the illustration into different churches, but there is an inequality that is very marked in the same church, many individuals of considerable ability giving very little, and others with comparatively small incomes contributing a great deal. It is impossible to equalize the voluntary gifts of people, and I do not think that the compelling of the church to move would tend toward equalization of expenditure in that direction, particularly when both pay taxes, in moving into a new situation.

Q. You believe in the principle of complete separation of church and state, do you not?—A. I do.

Q. Suppose you exempt a Christian church from taxation. Do you not thereby tax people who are not Christians?—A. I hold that every man is bound to support good order in his community, and the church is the best policeman in any city that we have.

Q. Supposing a man did not believe that it is?—A. Then he is an exception, and the State can not change its regulations to agree to the peculiar views of every individual. I think the general consensus of opinion is that they are of inestimable advantage to every citizen.

Q. You would not put any limit then upon the valuation of the church property that may be exempt from taxation, if it is used for church purposes?—A. No. Allow them to spend all the money they see fit.

Q. No matter how extravagant they may be and how much they indulge that extravagance?—A. No. If the church is as fine as the Temple at Jerusalem I believe it would be a mistake to tax it out of existence. It would be an advantage to the locality where it is, from the motive of good citizenship, liberality; its beneficent influences will go out over a large territory beyond the area in which it is located.

Q. Do you think that if all churches were taxed with fair equality as to their value that it would drive any one of them out of existence?—A. I think the tendency of it would be to do that, although I do not think it would do it.

Q. Why would it not be better to let every tub stand on its own bottom? Let the people who belong to that church make their contributions to it just enough larger to pay the tax, and then there will be perfect equality between different churches.—A. I do not quite understand what is meant by equality in this sense; but the general principle that I stated, I think, ought to hold with regard to churches. They are natural nonincome-producing property. To tax them, if their contributors were to go out of existence, would be to confiscate the property, or if the contributors were to withhold their support, which is a voluntary contribution out of their income which they are under no obligation to make except a moral one, it would tax the property, and I think it would be confiscated, and the state can not afford to do it.

Q. Should it not be confiscated when the contributors to it have lost their interest and will not maintain it?—A. I do not think the state has the right to confiscate private property unless the exigency is very great.

Q. Is not every man's property taxed to the extent of confiscation if he does not pay his tax?—A. That is nonincome-producing property. The amount of taxation that would be upon it would not be greater if the tax is equitable than its income-producing power. The other has no income-producing power, naturally.

Q. (By Mr. FARQUHAR.) Is it not a fact that the communicants and the members of any congregation support the church themselves?—A. Yes.

Q. Is it not also a fact that a man that supports a church and all the educational institutions of the church, Sunday schools, and everything else—that the amount of money that he contributes to that church, and to the well-being of the community is, averaged all around, half the tax he will pay even on his home and other property?—A. I think it probably is.

Q. If you tax church property as you tax business property, and the ordinary church, which is only supported by voluntary contributions, had to take out of their funds this tax for the benefit of the general treasury, would it not naturally entail a reduction in the revenues of this church that go to foreign and home missions, and the building-up of little country churches, and the spread of civilization, and everything that makes American civilization, or the world's civilization, simply because it is a question of taxing and putting into the common treasury this money?—A. Yes.

Q. (By Mr. CLARKE.) If you increase your public revenue by levying a tax upon churches, do you not therefore diminish by just so much the revenue that you derive from the individual contributors to those churches?—A. The church is made up of individuals, and any burden that is laid upon the church is an additional burden, is a burden upon individuals; the ordinary tax that the individual has to pay he must pay. If the church property is taxed, he must pay, in addition to the ordinary tax that he is called upon to pay, whatever this assessment upon the church property may be.

Q. But the assessment upon the individual would be less if the Government derived what it needs from the other source, would it not?—A. The amount so derived would be so insignificant, and the injury to public morals and interests so great, that I think the Government could not consider it.

Q. Would it not be just the same?—A. I do not think so.

Q. (By Mr. PHILLIPS.) Do you know what part of the people of Pennsylvania are church-going—members of or contributors to churches?—A. I do not; I have no idea.

Q. (By Mr. CLARKE.) If you exempt the church from taxation, do you not thereby tax people for the support of that church who do not belong to it, and is not that a mixing of church and state?—A. I think the taxation upon the general public outside of the churches is so trifling and so remote that it can hardly have serious consideration among legislators. The fraction, when distributed, would be so insignificant as to really mean nothing at all to the great mass of people outside of the churches; and they are advantaged to any burden additional that they might be called upon to bear in the general morals of the community, and in saving in police and other expenses that they as citizens are taxed for.

Q. If the churches were maintained they would be advantaged just the same if they were taxed, would they not?—A. The general principle, I suppose, is just this. We could doubtless argue the question for a long time. The general principle is that it is unfair to increase the burden of men who are already doing their full duty as citizens in the payment of tax, by requiring them to pay a tax upon an object of beneficence.

Q. You would not attempt to equalize this burden among the good people who are willing to contribute voluntarily to maintain churches as institutions of religion and good morals, but let one be extravagant and another economical, as they may please?—A. Just as they please; yes. It is their own money to be expended as their liking may be. A very expensive church is entirely proper in one locality, and in another it would not only be in bad taste but would also be a great burden. Yet it is not well to look a gift horse in the mouth, and be too critical when people are taking money out of their own pockets and giving it to a matter that is for the public good, and from which they expect to receive no return.

Q. (By Mr. A. L. HARRIS.) Now, your additional remedy?—A. I wanted to call attention to one of the effects of the present method of taxation that is seen in the condition of the forests of the country. About 50 years ago Pennsylvania was forested from the Virginia line up to the York State line, through a breadth of, perhaps, 100 miles, but to-day there is hardly any timber in all that region, so that the country is practically deforested. That has occurred within about 50 years, and it is impossible to-day for a man in Pennsylvania to hold timber land. The tax upon timber land in Pennsylvania will confiscate it in a very few years, and the result of that has been that our lumbermen have gone in and cut the forests out of Pennsylvania. Thousands and tens of thousands of acres that would have been standing to-day if the taxation had permitted it. The localities, seeing a valuable tract of timber land, raised the taxes upon it to such an extent that the annual growth would not begin to pay the amount of tax, together with the interest on the money invested in it, and the owners have had to cut it off and sell it in self defense; and quantities of lands have been abandoned by the owners and sold at tax sales, simply because the original owners could not afford to hold them; they cut the timber off and then turned it over and let anybody have it that wanted it. I think that is one of the great evils of the present system of taxing what is in sight at what it seems to be worth if it were sold right now, without taking into account its income-producing value year by year. Our farms are taxed by what the assessors consider they would sell for in the market, whereas their real income-producing value is away below the 6 per cent on the amount that he has been taxed for, and the effect of that is confiscation. So that the amount of tax that ought to be levied should have a direct relation in each particular piece of property to its income-producing power, and never should the amount exceed the income after the necessary expenses of conducting the operation are subtracted.

Q. (By Mr. PHILLIPS.) The denuding of this timber land occurred largely along the foothills of the Allegheny Mountains, where it was pine and hemlock, the soil not being very good for cultivation; was it not, largely, and in the east?—A. And clear over the Allegheny range; the entire region has been denuded.

Q. But the surface itself has not been very valuable for farming, and, therefore, it has been sold for taxes?—A. Sold for taxes. We have now in our forestry division in Pennsylvania an option on 50,000 acres of forest lands, and plenty of people are coming to us now and wanting us to take their lands at from 50 cents to \$1.50 an acre, that a few years ago were worth a large amount of money because of the timber that was upon them; but now they are comparatively valueless; and the reason why they are in the condition in which they are is largely due to the fact that men could not hold them who cared at all about having their money bring in a fair revenue. But if there had been some system by which the forest growth had been valued and the owner allowed a fair income upon that and the balance taken for taxation, millions of acres, I believe, would have been—certainly a million of acres would have been in the hands of the owners to-day, and would have been there for the maintenance of a great industry that has pretty nearly left our State.

Q. (By Mr. A. L. HARRIS.) You may state what, if any, is the value of forests to the agricultural citizen, outside of the forest regions?—A. Well, our cities now are dependent upon the head waters of our rivers for their water supply, and the deforesting of a country takes away the reservoir character of a district; the water that falls running off nearly at once into the streams and flushing them to full height, immediately, so that the floods are very destructive and a slight

drouth dries them up almost completely. The forests act as a reservoir and the water is prevented from flowing off, and percolates into the soil and is held by the leaf material and the roots and gradually fills the river, preventing these sudden rises in that respect and continuing the flowing of springs and streams during the entire season, and providing a healthful and abundant supply of fresh water to our cities. Philadelphia and Pittsburg suffer almost every year from both of these causes; and in our State authority has been granted to purchase on the head waters of our three principal rivers—the Allegheny, the Susquehanna, and the Delaware—lands not less than 40,000 acres and as many more as the commission see fit to purchase, for the purpose of protecting the water supply of these great cities that are situated upon the rivers.

Q. Is your legislature doing anything to encourage the growth of new forests?—A. Yes.

Q. And protect the old?—A. Our forestry commissioner has authority to purchase lands at tax sale, and we have a commission outside of our department of agriculture that has authority to condemn lands and appropriate them for forestry purposes; so that we have, I think, the best forestry laws of any State in the Union, but they are just going into operation. We have some lands purchased outright and now in title of the State, and, as I said, a large amount of land is held upon option awaiting the redemption by the original owners, which is not likely to occur; and we hope that the State will have many thousands of acres of land in the near future that will be reforested and preserved from fire, and allowed to grow up for the purpose of protecting the water supply, and being a source of revenue to the Commonwealth in the future. The German Government, only a few years ago, in their report showed that they received annually about \$95,000,000 from their forests, and that about \$55,000,000 of that is clear profit; and there are many districts where there are no taxes whatever levied for any purpose. The forests supply all the revenues for the schools and roads that the district requires. And Pennsylvania, by a proper system of reforesting, can, in the course of ninety years, and perhaps somewhat earlier, pay a large part of the expenses of government from the income derived from forests, and in the meantime give profitable employment to a good many of her citizens in doing a thing that we ought to have prevented the necessity for, plant out forests and maintain them.

Q. (By Mr. PHILLIPS.) Has there not been a very large acreage, for instance, of hemlock timber cut simply for the bark, and the trees themselves left to rot?—A. I think that was true to a great extent years ago, but just now it is not the fact. They are gathering up everything that they can get. I have known large tracts to be cut down in windrows, the finest timber that could grow, and allowed to lie a year, and then burnt up; hundreds of acres of it. A large part of the district up toward Lake Erie was cleared up in that way; the timber was burnt up right on the ground.

Q. (By Representative GARDNER.) What comes up on that land after the forests are cut off?—A. It depends on the character of the land. Some places white pine, other places white oak and chestnut. The white pine grows very readily wherever there has been white pine in the woods previously.

Q. (By Mr. FARQUHAR.) How have you utilized the hemlock?—A. It is cut into boards; it is cut into square timber for building purposes, the bark is used, and the tops are used for wood-paper.

Q. Have they taken up the fallen timber there and utilized it in any other way?—A. It is not the fallen timber.

Q. I mean the cut timber.—A. I think there was not as much of that as perhaps my statement would indicate. The timber originally was comparatively of little value, and hemlock that lies for any considerable time is worthless. But districts that have been cut off in recent years are being cleared up of their tops and rejected portions, by persons who come in now for paper wood, and large amounts of it are being exported or used up in our own State for pulp.

Q. (By Representative GARDNER.) You say that various woods—white pine and perhaps principally white oak—come up on the land after the original tract is cut off. Now, is that quite generally destroyed by fires?—A. Yes; very frequently.

Q. Does the high taxation make the notion of holding land until that timber grows up, hopeless to the owner so that it is abandoned and does not come into the position of taxable property, mostly due to the lack of care, which in turn allow the destruction of the young forests by fire?—A. I think so.

Q. Have you any suggestion as to a mode of taxation, after the timber has been cut from a piece of land, for the period while the new growth is coming on and before it has become profitable? That is to say, after you cut off your timber, and even if white oak follows, it is 7 or 8 years before you can get an income, the

~~it is not correct that and they must have seven years; so there~~

is a period of 7 years when there is no income. Have you a method of taxation during that period of time?—A. The method of valuation that I suggest is that the income-producing power of a piece of ground should be discovered, rating it at its value 10 years ago, probably, and its value now, and then let it pay tax upon that income-producing power and keep that up as long as the timber lot exists, and then when the timber is finally cut down let there be a tax levied upon the product instead of such a ruinous tax being put on the land while the timber is growing. Let the main tax come on the product, so as to defer the cutting of the timber as long as possible and make it to the advantage of capitalists who wish to invest their money over a long series of years to put it into timber land, having the assurance that it will not be taxed out of existence, and that ultimately it will pay a fine revenue for their estates.

Q. Is it not the business practice of large owners of timber lands to select trees to cut, and not denude the whole section, but keep the growth about even from year to year?—A. That is being done to a certain very limited extent; that is, they go on with that system as a system of thinning until the growth becomes pretty nearly uniform, then allow the rest to continue, and when that matures they cut it all off and reforest—either let it sprout out or replant. I think the German method does both; that is, takes out at first the better portions and allows the other to grow for 30 or perhaps 40 years, and then the forest is pretty nearly uniform—the trees that remain. That is allowed to continue for another 30 or 40 years, and when it has fully matured they cut the entire section off and reforest it.

Q. Does this German system, or any other with which you are familiar, encourage the planting of trees of high value?—A. Yes; that is what they do encourage, mostly the conifera; the German foresters plant these, and they also plant some trees of inferior quality, simply for pruning purposes; that is, trees that will grow in amongst the cone-bearing trees, evergreens, and have the effect of tending to prevent the growth of lower limbs on the other trees; and after a while these are cut out and the others allowed to grow without any further growth amongst them.

Q. (By Mr. A. L. HARRIS.) Is there any disposition on the part of the farmers to emigrate from the farms into other localities or other States from your State?—A. The statistics show that along about 1800 nearly 89 per cent of the people of Pennsylvania lived outside of incorporated towns and cities, and in 1890 44 per cent lived outside of the incorporated towns and villages. And in 1800, of the 89 per cent that lived outside of these cities and incorporated towns, almost the entire number were engaged in agriculture in some form. To-day, in Pennsylvania, only about 21 per cent of her citizens are engaged in agriculture, showing that there has been not only a great immigration into the cities, but that the percentage of agricultural people has been greatly reduced inside of 90 years.

Q. What is the cause?—A. I think, perhaps, there are many causes. One doubtless is the hope of gain that our cities present for young men, in their estimation, opportunities for advancement and gain that they feel the country does not present; and another cause which, perhaps, affects the older persons who have been engaged in country life, who have been engaged in agriculture, is the absence of suitable rural schools for the education of their children.

Most of our people now see that it is absolutely necessary for the young people to be educated more highly than they themselves were if they are to successfully compete in the industries and occupations of life, and inasmuch as people live for their children, many families go to the towns, where the schools are graded and are better, for the purpose of getting educational advantages for their children. I believe that affects a great many people. Another reason, I think, is due to the fact that the country is remote from towns, because of the difficulty of access. The poor roads make it troublesome to get to towns that are within ordinary distance, and this influences a good many people to go there, who, otherwise, would stay in the country, if they had reasonably easy means of access to the post-office and the town, and the stores, and all that sort of thing.

Q. Have you any remedy to suggest?—A. I believe that the introduction, as I have said, of a better quality of rural schools, both primary and high schools, with the introduction of good roads into the country, will not only keep in the country many who would otherwise leave it, but will bring into the country from the neighboring towns and villages large numbers of our better class of people who would prefer country life, if it were made accessible, and if the comforts and conveniences of life could be had in the country. With the introduction of lighting apparatus that is not too expensive, and the ease with which water can be placed all through houses, and houses can be heated throughout, and with all the conveniences of city and town life to be had in the country, it would bring many thousands of people—is bringing many thousands of people now out into the country 5, 10 and 20 miles from the cities, who would not go into the country at all if it were not for the good roads and the possibility of having these conveniences.

If we can supply good roads and conveniences and show the people how they can fit up their homes with all the modern appliances without too great expense, it will do a great deal to bring back into the country many who have gone from it, and keep there many who would otherwise leave it.

Q. Is there not a decline in the money value of farm lands in Pennsylvania?—A. Yes.

Q. (By Mr. PHILLIPS.) In what periods?—A. I have made an examination into the value of farm lands in Pennsylvania between the years 1859 and 1889; the one in 1859 is, I suppose, a normal period, and these other different periods of 1869 and 1879 and 1889 are perhaps abnormal.

The price of farm lands in Pennsylvania in 1859 averaged \$63.27; in 1869 the average was \$90.61; in 1879 the average was \$72.68; in 1889 the average was \$53.37.

Q. (By Mr. A. L. HARRIS.) Now, you may state the cause for that decline, if you can.—A. I do not suppose that there is any one cause that has produced this result, but there is one that seems to have had a good deal to do with bringing it about; I refer to the extension of railroads during that period.

I made a comparison between the extension of railroads to the lands of the far West and elsewhere, and the value of farm lands in Pennsylvania. In 1859 we had in this country 28,789 miles of railroad, and the price of farm lands was \$63.27; in 1869 we had 46,814 miles of railroad in the entire country, and the price of farm land had gone up to \$90.60 per acre. Of course, there was an inflated currency at the time that you must bear in mind. In 1879 there were 86,584 miles of railroad, and the price of farm land had dropped to \$72.68; in 1889 there were 162,000 miles of railroads, and the value of farm land had dropped to \$53.37. In 1891 there were 171,000 miles of railroad; that is, between 1871 and 1891 there were built in this country 119,554 miles of railroad, and the table shows that as the railroads extended and this enormous territory of free, fertile land in the far West was developed, the price of farm lands in the East dropped. There was a placing on the market of the agricultural lands that had been appropriated by Congress to the States, many hundreds of thousands of acres, all coming very nearly at the same time, that reduced the price also. Young men who were intending to make farming a profession, who lived here in the East, refused to pay \$90.61 an acre for land when they found that by going West they could buy land at from 50 cents to \$1 or \$1.50 per acre, better than the lands they had here, except that there were no improvements on them, and that the rates of freight to the East were not prohibitory, and that the yield was greatly in excess of what they could grow here, and that they could get cheap homes in the West by going and taking them and investing but a small amount of money. The effect was there were fewer purchasers for land in the East, and this other putting of land on the market so glutted the market, and the supply of farm lands on the market for a time was so great, that the price had to drop in the Eastern section of the country.

Q. (By Representative GARDNER.) The law of supply and demand?—A. I think so. This was brought about largely by the improving of these lands and by the enormous development of these railroad systems, and the cheap rates that were offered to shippers in the far West.

Q. In the statement of the shrinkage in the selling price of farm lands within given years, as you have stated it there, is it or is it not true that that decline is based on the earning capacity much more than appears by the figures? In other words, does not the rate of interest, which in that time materially declined, did not that have a natural effect to decrease the price of land? For instance, if a farm sells for \$10,000 when the prevailing rate of interest is 7 per cent, in so far as that is any basis of its earning capacity, it means it is worth a clear income of \$700 a year?—A. Yes.

Q. At the time you state your lowest decline, is it not a fact that the rate of interest had fallen to 6 per cent or below, and was not the decline greater than appears, if you take into account the rate of interest?—A. I think so. The value of farm products, during a portion of this time, owing somewhat to the inflated condition of our currency, I suppose, made farming a very profitable business. Wheat was a good price, and other farm products; horses were a good price, and pretty much everything that the farmer raised was a good price, so far as the debt-paying capacity of the product was concerned. It might not really have purchased more of given things than the same money later, but it paid more debt, and consequently the farming business was a somewhat better business at that period, so far as debt paying was concerned, than it was later.

Q. (By Mr. A. L. HARRIS.) What effect did this rapid development of the West have upon production?—A. It has increased the aggregate production of the country very greatly, and it has changed to some extent the agriculture of different sections. It has been found that there are certain districts in the Far West

that are especially adapted to the growth of certain crops, and they grow them to great perfection. Our Eastern States have found it necessary to vary to some extent the character of the crops, and we are getting to raise a greater variety, taking up the culturing of more perishable articles and such as are not so easily transported for long distances.

Q. What effect did this production in the West have on prices of farm products?—A. I suppose the general effect has been to bring down prices upon certain crops—wheat, for instance. I do not think it has affected hay, and perhaps not greatly affected corn, because of the bulk. But wheat has been affected by the opening up of these districts and the cheap freight rates that prevail.

Q. Have you made the extension of foreign markets a study to any extent?—A. I can not say that I have, excepting this far: I believe that the introduction of our products into the markets of other countries must begin here at home, having a more rigid inspection of the articles that we export, so that inferior goods can not be sent abroad to impair the general reputation of the goods sent out from this country. A cargo of poor goods labeled "Good" will do almost irreparable damage to the trade that previously may have been excellent. We need to protect our best exporters by requiring that goods going abroad shall be of a certain quality, or at least, that the quality, whatever it is, shall be marked upon them, so that the purchaser can see from the label itself whether it is first class or whether they are of a lower value. That is about as far as I believe I have any suggestion to make; a rigid system of inspection so that goods going from this country with our brand will be guaranteed to possess a certain quality that the brand indicates.

Q. Is that required now by Federal law?—A. The United States Government has inspectors of meats, and our foreign exports of meat must undergo an inspection by Government officers, and that has been of great service; but I believe there is no such inspection of fruits nor dairy products, nor of many of our canned goods, manufactured articles of various sorts.

Q. Would such inspection be advisable?—A. In my judgment it would, because we are anxious to have a foreign market, and are called upon to compete with our neighbor Canada, and they are sending goods that are guaranteed right over to England and are rapidly taking the dairy market that we ought to have. They are taking it by putting their goods over in good condition and guaranteeing that they are all right.

Q. (By Mr. CLARKE.) You do not claim that we have any better right to it unless we can produce a better article?—A. That is the right that is recognized everywhere.

Q. (By Mr. PHILLIPS.) In regard to the pure-food law of your State, do you consider it amongst the best, or should it be amended?—A. I am not familiar enough with the laws of the other States to be able to make a comparison, but our pure-food law has done good service for us in clearing the shelves of groceries and stores of articles of food injurious to health. It was the practice, before the establishment of the department that has charge of the pure-food law, for manufacturers of canned goods and others of a perishable nature, to use preservatives, boracic acid and salicylic acid, things that are regarded as injurious to the health of those that consume them. We have by a system of inspection and analysis and prosecution rid the shelves of our stores in Pennsylvania largely of goods of that character, and I think have done as much for the public health as many of the physicians in the State.

Q. You consider it, then, as being pretty well enforced?—A. We are trying to enforce it, and we have, I think, some 13 inspectors out all the time, whose sole business it is to secure samples; and we have a number of chemists whose business it is to analyze them, and reports are made to the dairy and food commissioner, and whenever our chemists report that the article is clearly a violation of the law in its constitution, suit is brought and the parties are brought to answer for it.

Q. Have these inspectors of your department found any special defects in the law, so far, that ought to be remedied?—A. The difficulty that we have to contend with just now is one that our law does not reach. A man may adulterate his goods with a harmless adulteration, and in that way impose upon the public. It must not be a thing injurious to health; if it is injurious to health, we can suppress it; but if he will mark on the package that this is a compound, then he can put into it what he pleases in the way of adulteration, provided only that that adulteration is not injurious to health. And the public may thereby be deceived in supposing that the thing has more of the valuable ingredient in it than it does possess, and you are not sure of what you are purchasing; for instance, in pepper or some other spices, or perhaps buckwheat flour, or many other articles of food.

Q. (By Representative GARDNER.) If the stomach is filled with that which lacks

nutritive value, although the individual may not be poisoned or injured by way of having the organs deranged, still if he is a laboring man, the muscle-making material is less; and if a man, to take an extreme case, were fed with something that would satisfy the stomach but had no nutritive value, and he attempted to work, it would only be a question of time until he would die. Now, is it not true, in adulteration, that the compound that looks right, but is deficient in nutritive value, is injurious to health?—A. We do not so regard it. A certain amount of such material seems to be necessary in order to distend the stomach in order that the action of the stomach in the process of digestion may be healthful. I think the difficulty that they found with some of the concentrated rations for soldiers has been due to that fact; they have all been too concentrated, and did not have enough of this extra material, such as ordinary cellulose fiber, that is practically indigestible, to distend the stomach and so keep up a healthful condition of the organs of digestion. In most of our foods, wheat and most of the cereals, there is a certain indigestible portion, and while it does not directly give nutrition, it does aid digestion. So that we do not consider that harmless substances put into any food is likely to be an injury in the sense of injuring health, as does salicylic acid or boracic acid. It makes it less nutritious, and there may be so much of it put in as to make the food practically worthless.

Q. (By Mr. KENNEDY.) Is butterine, which is made from the fat of slaughterery animals and 25 per cent of pure milk injurious to health?—A. It depends very much on how it is made and the condition of the material. I would want to know how it was put up and how preserved. If the animals were all healthy, and the articles all pure, and the material prepared without the use of injurious substances, it would not be injurious to health, in my judgment.

Q. You spoke about Canada getting a market abroad for dairy products which this country should have. Have you any statistics which show what surplus, if any, there is of dairy products in this country?—A. No; I can not give them to you. I think that Secretary Wilson, of the Department of Agriculture, could give that without difficulty.

Q. Do you believe there is a large surplus over the needs of the home market?—A. There is not in Pennsylvania. The butter that we produce in Pennsylvania amounts to about 90,000,000 pounds; we consume annually about 160,000,000 pounds. So the business is not overdone in our State, but I am not familiar with the condition of affairs so far as the General Government is concerned.

Q. (By Representative GARDNER.) Tell us, if you can, why it is, in the State of Pennsylvania, in this state of affairs, that the creameries are all the while seeking outside markets? Why is it they try to sell outside so much butter to be replaced by other butter?—A. I presume they are doing just what all merchants are doing—seeking markets; and I am not sure that they prefer an outside market, but knowing of outside markets, they do not feel under obligation to sell wholly at home. I think also, as part of the explanation, that the Northwest have organized their dairy industry in better shape than is ours. They have boards of trade, such as the Elgin Board of Trade, that inspect dairy products; and their stamp gives character to the product; so that our merchants in many instances, desiring to have a steady uniform grade without having to inspect it, take an Elgin brand, and are sure, from the fact that it is branded by the Elgin people, that it is all right, and that the second consignment will be equal to the first, and so on. We have no boards of trade in our State, and the effort now is to try and organize boards of trade that will inspect the dairy products of the community and give character to them by giving the result of their inspection on the stamp upon the article, and when that is fully inaugurated I think our own merchants will stand up for our own goods in preference to those that come from abroad.

Q. Then the answer is in part that the people seek a convenient market without regard to State lines, and that competition is made more effectual in your State because of the more reliable brand coming from the outside?—A. Yes.

Q. (By Mr. CLARKE.) Is there not another reason? Do not the producers of the highest grade of your dairy products seek outside markets because they can get a higher price after having supplied the higher-priced customers in Pennsylvania?—A. I do not know how that is. Naturally, the producer of a good article seeks and can get a higher price both at home and abroad than the man who produces an inferior article, but I am not sure that the surplussage of high-priced butter is great enough to warrant our producers in going outside of the State. We have enough people in the State who desire to purchase it if they could be sure of the same quality year by year, and the supply would be sufficient to meet their needs.

Q. Take, for example, "Philadelphia prints," a butter which some years ago attained a very high reputation outside as well as inside the State; has there not

been a continuous market for it outside of the State, even when the occasion for it has largely disappeared by reason of the development of the system in the West and other States, producing good butter?—A. I am not sufficiently informed to speak accurately upon that.

Q. (By Mr. A. L. HARRIS.) You touched a while ago on the subject of good roads. Do you wish to say anything further in regard to the importance of good roads, and what your State is doing in that direction?—A. We are very much interested in this question. Our State system is a very imperfect one, and perhaps we are further behind in the matter of the construction of roads than any other single part of our government. It is the old method, in most of the districts, of working out or loafing out the tax. That is the method, and it is in the hands of perhaps the most inefficient of our people, because the system is such that a business man, or a man with any considerable occupation, can not afford to be a road supervisor. He can not stand, as our system requires, and oversee half a dozen people or more working—or going through the motions of work—on the public road, and collect duplicates, 10-cent taxes and 15-cent taxes, and all that. So that the system is defective in the matter of our supervision. That is the radical defect of the old method as it is pursued in our State. Until we can have an efficient supervision we can not have good roads.

Q. (By Mr. RATCHFORD.) The supervisor who gets a half dozen men at one time is a lucky man, is he not?—A. He, in many cases, wants to keep the position, because usually he is a man that has nothing else to do. He is selected because he is unable to do anything else, and it is a polite way of keeping him off the township often. He gets \$200 or \$250 or \$300 for the supervision of roads. That will keep him and his family very well, and so he desires reelection annually, and does not urge those that are called out to work under him to do more than is absolutely necessary. So it is that he secures his reelection year after year, and after 20 years of such service the roads are no better than they were when he began.

I made a very careful examination into the road system of our State, collected the names of all the supervisors, over 3,000, corresponded with them, and tried to get at the mileage and see what the conditions were, and I found we had about 100,000 miles of roads in Pennsylvania, outside of the boroughs and cities, and that this costs us about \$4,000,000 a year, or at the rate of \$40 a mile, and the most of them are no better than they were 20 years ago. In some localities they have improved very much, near cities, where gentlemen have put up country residences and have taken an interest in the improvement, and where the taxes that are levied are not a burden on those that live there. They have built good roads, notably about Philadelphia; but of the great body of the roads, 80 per cent, maybe 90 per cent, are very little better than they were a good many years ago, and this tax is being annually expended.

It is perfectly practicable to take the taxes that we now have and put our roads into reasonably good condition in a comparatively short time. In most districts throughout this State we have an abundance of good material for ballast, and with proper care and some business energy put into this we can have our roads very greatly improved.

Q. (By Mr. KENNEDY.) Is there any sentiment in your State in favor of working the convicts on the roads?—A. We have a law, passed this last winter. I am not quite sure that I can give it exactly; but it is, in effect, this: That the prisoners in all county jails may be taken out and worked upon the roads in the immediate vicinity of these prisons. The penitentiaries, however, were not, as I understand it, included in that law; simply the prisoners in the county jails. They can be worked on the roads at the discretion, I think, of the town officials, and yet I can not give you the exact authorities who have that matter under control.

Q. (By Mr. PHILLIPS.) Would you think such a law would have a degrading effect on the prisoners, working them in that form under supervision?—A. It seems to me it depends on the way it is done. If they are to work with ball and chain, it looks as if it was a spectacle that we would prefer not to witness as we drive along the roads. If they are worked under supervision and the authority that keeps them in subjection is in a measure concealed, not obtruded, then I think it would be all right.

Q. (By Representative GARDNER.) How can you keep them from running away?—A. In California they have been securing stone quarries and building a temporary prison at the quarries, putting up strong inclosures, and having the men quarry the stone, and run the stone crusher. The guard is there, but it does not require an extraordinary force to keep the prisoners under control. The stone is then hauled from this central station to the point where needed.

Q. I suppose they are fenced in?—A. In some cases they have built temporary prisons, and they have found it to work satisfactorily.

Q. (By Mr. PHILLIPS.) Have you anything further to suggest in regard to the good road system?—A. I believe our country would be greatly advantaged by the introduction of good roads. Inasmuch as the tendency is toward the towns, and the business of the country is with the town, the railroad station, and the store, the building of a good road out to the farm brings it about one-half nearer the place of business, and to that extent it is an advantage; and it also enables the farmer to haul double the load that he did before, and save his time to that extent. Labor and time on the farm have come to be much more valuable than they used to be, and if the farmer can double his load and haul four loads instead of two, it will be of much more advantage than years ago, when it was not of so great value as it is to-day.

Q. Have you any amendment to the law in mind that would make it more valuable?—A. We have a law, passed in 1897, which provided for a uniform system of supervision throughout the State. Our supervisors now are elected in many ways. Some serve for 1 year, some 2, some 3; different prices are paid to the supervisors; in some counties no two townships have the same rules. This law that was passed 2 or 3 years ago contemplated the election of boards of supervisors composed of three persons, one to be elected each year, and to serve for 3 years; making the township board responsible. Then we contemplated the giving of State aid. The general feeling is that it is impossible for the farming people to build the roads themselves, and that they ought not to be expected to build them. When the country was younger and many more people lived in the country, all were interested in the good roads and could afford to meet the expense. Now all who live in the cities, merchants and manufacturers, are interested in roads as distributing agencies. We hold, therefore, that the State tax coming from corporations and from all kinds of business, distributed over the country in the interest of good roads, the building of good roads, would be a proper distribution of the money and necessary in order that we may have them. Farming people can not be taxed to the extent necessary to build the kinds of roads that modern civilization requires, so we are in favor of State aid.

This law which was passed contemplates further that during the construction of the road and afterwards there shall be a road master in charge all the time. Sections are districted so that each man is responsible for his section, and his business is to see that the material put on the road is kept there, and that the drains are kept open, and the ordinary road repairs made promptly. The act is inoperative, because the law requires \$1,000,000 to be appropriated before it shall go into effect, and our treasury has been in such a condition that it was impossible to make this grant. But just now a new board, of which Mr. Cassatt, president of the Pennsylvania Railroad Company, and General Beaver, judge of the superior court, are members, is appointed to take up this road question and make a report for the next legislature, so that we hope to have a law in operation in the course of a very few years that will give us good roads, and provide the assistance necessary for that purpose.

Q. In the meantime you are getting along under the old system?—A. Under the old order; yes.

Q. (By Mr. A. L. HARRIS.) Under the topic of remedial legislation, State or national, what suggestions have you to make?—A. As to oleomargarine legislation—we have a law regulating the manufacture and sale of oleomargarine. Several years ago there was a prohibitory law, and we found that it could not be thoroughly enforced, but last year a law was enacted that repealed the old prohibitory law and gives us a license system by which oleomargarine may be manufactured and sold in our State if it is without color, and if it is marked "oleomargarine" on every package that is sold, and if the hotels and restaurants that use it, and the groceries that sell it put up placards supplied by our department, stating that oleomargarine is used or sold there. The enforcement of this law is in the hands of the dairy and food commissioner of our department, and we have just had a suit determined in Pittsburgh on the question of the constitutionality of the color clause; the suit was decided in our favor. Another suit was heard in Philadelphia last Tuesday on the question as to whether the wholesale dealer could sell oleomargarine in the original package under the United States interstate-commerce law, and that decision we expect to have any day; perhaps the judges have given it to-day. They reserved their decision for a few days. We hope to have these two questions settled, and when that is done we think we can regulate the sale of it in our State; but I think there ought to be a tax put upon it, as some propose, of 10 cents a pound by the United States Government instead of the 2 cents that I believe is now on it, so as to raise the price of it, so that it can not undersell butter in the same market. The 2 cents tax, added to the 7

cents that it costs to manufacture it, brings the price up to about 9 cents, perhaps 8 cents a pound. All the dealer gets for it, which is about 18 or 20 cents, is pretty nearly clear profit, making it to the interest of the manufacturers and dealers to evade the law. They sell it as butter and represent it as real butter. A law by the United States Government taxing it 10 cents would raise the price to about 16 or 17 cents, so that the amount of profit in the business would not be great enough to justify these people in going to the risk of trying to evade our laws.

Q. What, in your opinion, is advisable in national legislation along the line of the pure-food law?—A. The difficulty that we have now is, as I stated, in the purchaser being protected against an adulterated article, and I think if the United States Government would pass a law requiring all kinds of food products to be labeled, giving the constituents of the article in percentages, so that individual purchasers might see upon the label the amount of the ingredients that the article contains, it would prevent fraud upon the public and enable a man who wanted to get a good article to purchase that, and the man who was contented to have an article diluted to purchase that; and the price of the two would not be the same. A law of that kind must, of course, be national, and just now there is a bill in Congress that is offered by Mr. Brosius, of our State, that looks toward the regulating of this matter by the National Government.

Q. (By Mr. CLARKE.) Would a law of that kind, in your judgment, be effective to prevent the adulteration of milk?—A. I hardly know. The cities have local regulations with regard to the adulteration of milk, and it is a matter that is easily detected, and just now the boards of health have taken up that question and the milk supply through our cities is fairly pure. We made an examination 2 or 3 years ago of the principal cities in our State and in New York City, to see just what the milk supply was, and found in some places that it was very impure; but since that, after the publication of the results, the boards of health in the several cities took the matter up and the milk supply is now reasonably pure. We make inspections occasionally to learn the conditions, and we find they are very greatly improved. I think that can be well referred to the localities to take care of.

Q. How would the law that you speak of, for printing on each package the quantity of the ingredients contained in it, work as a local regulation in the several States?—A. I can not see that it would do any harm, and it would be a notice to every individual who is a purchaser, of the character of the goods, and in my opinion he is entitled to that notice. He can not know, unless the State discloses it, just what the goods contain; and the several States could have analyses made to see that the goods in these packages correspond to the statements made upon the labels.

Q. (By Representative GARDNER.) A few years ago, when a great many people were canning sugar corn, a concern in Maryland bought up horse corn and put in it a whole lot of brown sugar, and commanded the market of the world, simply because it was sweeter than any other corn. Now, that label might have been all right, for it is so much corn and so much sirup, but should we not go further in such a case and require them to state what kind of corn was in that can?—A. I think it should; there should not be anything about the label that would conceal the character of the contents, or mislead.

Q. (By Mr. CLARKE.) Would you carry the same principle to wearing apparel?—A. No; I think we can safely leave that to the judgment of the purchaser. I know that there are frauds perpetrated there, but they do not affect the public health to any extent, and it is likely that any firm will soon be discovered if they sell an article that is a fraud upon the face of it; and their business instincts will lead them to give a pretty fair article.

Q. Suppose a man's health requires that he should wear 75 per cent of wool next to his person, and he buys an article which proves to contain only 50 per cent wool; will not his health be injuriously affected by that?—A. Yes; and he would have his remedy if the individual stated positively that it did contain a certain amount.

Q. (By Mr. A. L. HARRIS.) Is the Federal law to prevent the spread of disease among domestic animals satisfactory?—A. I think so; as far as it goes. They have a quarantine law which shuts out animals from Southern districts that are liable to be affected with anthrax, and prevents their coming in, unless they have been thoroughly treated so as to destroy the germ that breeds it; and the several States also have laws that tend to protect them against the spread of any contagious disease. We have a law in our State that authorizes our State live stock sanitary board to quarantine animals (and we do quarantine all cows that come into the State), and which requires them to be tested for tuberculosis.

Q. (By Mr. PHILLIPS.) At what point is that done?—A. It is done in Pittsburg.

Q. If they are in the State they can not be sold?—A. They can not be sold. When they come in they have quarantine officers who require a certificate from the dealer that the animals have been inspected, and that they are free from this particular disease. Then we have authority to quarantine animals that are found to be affected with any dangerous disease and isolate them from other animals right in our own State. The result is that we have been able to suppress most of these contagious diseases, such as glanders, anthrax, and various dangerous diseases common to cattle.

Q. (By Representative GARDNER.) Is there any inspection of stock as a matter of interstate commerce? For instance, almost all the horses coming through from the West are unloaded or inspected at Pittsburg, are they not?—A. Yes; they are unloaded, but can not say as to inspection.

Q. Is the same true of cattle and hogs largely, or is there any inspection whatever?—A. Yes; all stock is unloaded, but am not certain as to inspection.

Q. Is there anything at all to prevent the farmer of Ohio from sending diseased stock into the market of Cincinnati, and from there shipping into Philadelphia, and from there distributing into the other States?—A. Yes; we have a law which prevents his doing that. He can not ship cows into our State that are not tested for tuberculosis.

Q. But suppose they are being shipped through the State?—A. Well, they can not stop in our State. If they stop in our State, then they must have been inspected, and if they have not been inspected they must be inspected, and animals found to be diseased must be slaughtered.

Q. (By Mr. RATCHFORD.) Can they be shipped from one part of your State to another?—A. Yes; they can from the interior of the State. We, however, are inspecting the herds of the State—our State live stock sanitary board—and condemning large numbers of cattle.

Q. Is that board organized under the laws of the State?—A. Yes; under the State laws. Owners of herds are invited to apply for tests, if they suspect that tuberculosis exists in their herds, and our State live stock sanitary board sends a veterinary surgeon who tests the herd, and if any are found to be diseased they are slaughtered. The owner of the herd must, before the test is made, agree that any animals that are found diseased shall be slaughtered, and that his premises shall be properly cleaned up and measures taken to prevent the balance of his herd from becoming diseased. These animals that are slaughtered are appraised according to the regulation that the State provides. An ordinary cow can not have awarded as damages for her more than \$25, and the animal that is registered can not have awarded by examination more than \$50.

Q. Does the same inspection apply to hogs and sheep, for instance?—A. No.

Q. (By Representative GARDNER.) You spoke of cows coming into Pennsylvania. That does not apply to beef cattle?—A. No; it does not apply to beef cattle.

Q. It proposes to protect the dairies, then, and not the food supplies?—A. Yes; this is a dairy protection. In the beginning of our work, about 4 years ago, 25 per cent of the cattle in inspected herds were tubercular; now, although the method of selecting herds to test is more rigid and there are more infected herds reported by their owners to select from, only 11.6 per cent of the cattle in inspected herds are tubercular. These figures represent the conditions in the most extensively infected herds in the State. Up to this time the number of cattle tested under these regulations is 33,147, of which 4,561, or 13.7 per cent, were tubercular. For these \$102,909.62 have been paid, or an average of \$22.56 per head.

Q. How does that average compare with the value of the cows if they had been healthy?—A. I suppose the cows would have been worth anywhere from \$25 to \$40.

Q. (By Mr. RATCHFORD.) In a healthful condition?—A. Yes.

Q. (By Mr. CLARKE.) Is there any method of instituting an inspection by the public?—A. The only method is for the individual who suspects his herd to be infected to make application to the State live stock sanitary board; then they send a surgeon to inspect his herd, and if any are found to be diseased they are slaughtered under an agreement that was made, and the damages assessed.

Q. (By Mr. PHILLIPS.) They have a right, then, to enter a man's premises and do this without his consent?—A. They have a right to do it, but have not yet exercised it. We do not do that excepting where examination discloses tuberculosis and the milk is being used; then we go in and require that they shall be slaughtered or that the milk shall be destroyed.

Q. (By Mr. CLARKE.) How do you test for tuberculosis—by the use of tuberculin?—A. Yes.

Q. That is regarded as effective?—A. It is the most reliable.

Q. (By Mr. PHILLIPS.) Has there been a great deal of disease traced to the use of milk infected by tuberculosis?—A. Doctors disagree about it, but the general impression among the best veterinarians is that tuberculosis is transferable from the milk of cows to the human being. It is disputed, I know, but that seems to be generally believed. It can not be demonstrated to a certainty unless you can take a human being and find out whether he was tuberculous or not, and then give him tuberculous milk.

Q. Have there not been some cases where infants using certain cows' milk were affected in that way, where there was no tuberculosis in the family, which pretty nearly proved the proposition?—A. They claim that the evidence is so nearly conclusive that it is extremely dangerous to use it.

Q. (By Mr. CLARKE.) Has there been any imposition upon the State under this law whereby the farmers have disposed of cows at a good price that they have purchased outside at a very low price?—A. I do not know of any instance where that has been done. Generally the people of the locality know about the operations of their neighbors, and if such tricks were played doubtless our veterinarians would get hold of it, and the matter would be investigated. I do not know of any such thing having occurred.

We have a quarantine law which protects us from foreigners importing cattle, so we are not likely to be loaded down with diseased cattle from other States; but in our own State we are trying to cull out all cattle that are affected with tuberculosis, no matter in whose hands they are, and the regulation is that they are to be appraised at their actual value at the time the appraisement is made; and if they are badly affected that valuation is very low.

Q. (By Mr. RATCHFORD.) What does the State require to be done with cattle slaughtered under that law?—A. They are usually sent to fertilizer manufacturers.

Q. Are there any exceptions to the rule?—A. There are—or burned. It is only when the cases are bad that they are burned; and there is always a post-mortem examination made, assisted largely by the veterinary surgeon.

Q. Have any cases come to light in your State where they have reached the butchers?—A. I heard of one case, and only one, of all the number, and that was by a trick.

Q. Was it proven?—A. No, it was not exactly proven. The man himself stated what he had done in a rather boastful way to some person. He had bought the carcass for dog meat, and instead of using it for the dogs he had sold it, and was discovered. That was the only instance, I believe, in all our experience.

Q. (By Mr. PHILLIPS.) The hides are sold in the market, are they not?—A. They can be sold.

Q. (By Mr. KENNEDY.) Have the farmers of Pennsylvania manifested any interest in the proposed amendment to the interstate-commerce law? Are they opposed to pooling? And what are your own views on the subject of amending that law?—A. I am not familiar enough with the law to express myself upon it, and I am not familiar enough with the views of our farmers upon it to give an expression of their views.

Q. You can say nothing on the subject, then?—A. I believe I have no information that would be worth much.

Q. You do not know whether the farmers of Pennsylvania are opposed to permitting the railroads to pool? Do not the Granges or other organizations discuss it?—A. They do, and I think the feeling generally among the farmers and others is that the interstate-commerce law has been a very valuable aid in preventing discriminations in freights; that it has done a great deal in that direction; but I am not prepared to make a statement in regard to it such as would come from the knowledge that a man ought to have who pretends to give information.

Q. (By Mr. PHILLIPS.) Have you any suggestions to make in regard to the improvement of the tax laws of Pennsylvania; in regard to farming industries or farm lands?—A. I believe there ought to be a readjustment of the tax laws and that they should be put upon an equitable basis; that every man should pay his just proportion of tax and that no man should escape, and that our citizens should pay according to their ability. It would be impracticable to outline a complete system here, even if I were able, but I think working along that principle, along that line, is the proper method; and then take up some of these objects that have escaped taxation and try to even them up, so that they will bear the burdens of government according to their ability, along with real estate owners.

Q. It is your opinion that the farmers of Pennsylvania bear too great a burden of tax, is it?—A. I believe that the real estate holders are taxed out of all proportion to the other classes of men engaged in business, and the farmers are members, of course, of that class; but I would not want to say that they were taxed beyond the taxation that affects other real estate holders. Real estate pays tax

out of all proportion to the amount that is derived from other income-producing sources.

Q. (By Mr. CLARKE.) And yet that has not served to prevent Philadelphia from becoming world-renowned as a city of homes, has it?—A. It is world-renowned for its homes. How much better these places might all be if things are adjusted a little more equitably no one can tell.

Q. (By Mr. RATCHFORD.) How do the farmers view the present tendency of combinations, consolidations of interests, commonly called trusts? Have your State lecturers brought that prominently before the people of your State?—A. We have not taken that up in our institutes generally. It has arisen. The fact is, in our institutes we have been discouraging political discussion, or sectional or sectarian discussion, holding our people down to the teachings of the principles of agriculture, or, rather, leaving these controverted questions, such as tariff, free trade, silver, gold, and all that to the regular election periods and to the orators who are sent out by different political parties. We have tried to avoid that, because we think it rather brings confusion into our work and distracts attention from the real object of it, which is to get information upon practical agricultural subjects. I am not authorized to speak for the farmers of Pennsylvania in that matter, and I do not know that I could at all voice their sentiments. I think they are very much like other people, divided along party lines, and some think one way and some think the other, and when they come to line up they line up, as a rule, along with their respective parties, so that perhaps there is no universal view, or a view that is universal among them.

Q. Is it to be understood that they regard as partisan politics the subject of combinations and trusts?—A. I do not know what they would say if they were to answer for themselves.

Q. We only ask your opinion.—A. I think it is becoming apparent now that it is becoming a question of politics and that this is the form in which it will be presented in the future. My own feeling is that they are large corporations, and the legislation that is needed is just the same legislation that is needed for the smaller corporations, and that we should have power everywhere such as will control them and keep them from transgressing the laws of the land and infringing the rights of the individual. We have them. They have come to stay, and we must deal with them. I do not believe it is possible to banish them from the country or that it would be wise to do so any more than to banish our corporations, of which these are only aggregations; but that we should pass legislation, as I have said, that will enable the private individual to protect himself in the exercise of his rights against the most powerful combination that there is in the country and that the force of the State should be back of him to the full extent of its powers, to enforce the laws in his behalf, just the same as it would be back of him if an assault were made upon his person or his property. In such a case, first of all, the police are authorized to protect him; then the posse comitatus; after that the force of the county; then of the State; then of the United States, if necessary, to protect a citizen. There should be in our legislation some method that would be inexpensive to the individual and that would protect him against the most highly organized and stupendous corporation that the State has created. The State is bound to do this, on the principle that it granted the franchises and gave these institutions the great powers that they possess and made the individual citizen largely defenseless. While he has now the right to go to court we all know he has no power to gain redress, unless he has large personal influence or more money than the average individual possesses.

Q. (By Representative GARDNER.) Would you not put the duty of the county and the State and the Government to protect the citizen on a broader ground, even, than the fact that a corporation had its power granted from the State? For instance, if it should be found that a combination could exercise a power equally oppressive without being a corporation at all, the obligation of the State to protect the individual would be none the less, would it?—A. I said all aggregations of power, and it would include every great interest that was authorized by the State, particularly incorporated companies, because an incorporated company has been directly authorized by the State to exercise power, and the State, therefore, is under special obligation to protect its citizens from abuses of the power given by it directly in the charter of the corporation.

Q. Is the obligation of the State to protect the individual against unjust power anywhere as great as any obligation can be?—A. It is; it is a great obligation.

Q. As to the matter of going to court against corporations. Is there any suspicion that you know of in Pennsylvania or elsewhere that the individual is at any disadvantage over a corporation before a jury?—A. No, the disadvantage is in his not being able to supply counsel and meet the expenses that are necessarily attendant upon a suit at law against a great corporation.

Q. That is, the corporation can afford to carry on litigation?—A. Yes. I think that is the trouble! The juries, I think, perhaps, are against the corporations as a rule, but that was not the point I was making, but that the individual, by reason of his poverty, was unable in many instances to secure proper counsel to protect him.

Q. (By Mr. CLARKE.) You would not have the State help him to carry on litigation of a private nature, would you?—A. I would ask the State to protect me in case I was assaulted on the street—and that is a private matter—or if a man undertook to enter my house, I would feel that I could call upon the State for protection without expense to myself.

Q. (By Representative GARDNER.) That is in the class of things recognized as criminal, but I take it Mr. Clarke means civil matters. For instance, you have grievances against a corporation for discrimination or some thing that is a matter of civil action; you also have a grievance against John Jones, who leases your farm and has refused to move at the expiration of the lease, keeping you out of your property. You have a civil action in the court. I understood Mr. Clarke to be asking if you would have any discrimination between two such cases as to the State's rights to interfere?—A. In the case in which the State has directly given these powers, as I remarked, the State thereby assumes to see that that individual does not transgress the powers that it has been given, and is to that extent more liable, it seems to me, to protect the helpless against the abuse of this power that it has given.

Q. Has not the State directly given almost all powers, including the right to hold title of the farm?—A. Where the franchise is given, there are specific powers granted that sometimes are misused. I am not to be understood as opposing corporations. I believe in them. I am talking now about the regulation of them as against the private individual, particularly since these aggregations of corporations have come into existence and whose great power is feared by the individual citizen. I think in such cases it is the duty of the State to so protect the individual against any possible harm from them that public security will be established, and that our business men and others may feel that there is no reason for being antagonistic to these great organizations, but that they will be kept within the limits of that law, just the same as the individual is required to stay in the limits of the law that regulates him.

(Testimony closed.)

WASHINGTON, D. C., January 13, 1900.

TESTIMONY OF MR. J. H. HALE,

Farmer, Fort Valley, Ga., and South Glastonbury, Conn.

The commission met at 12.10 p. m., Mr. Clarke presiding.

Mr. J. H. Hale was introduced as a witness, and, after being duly sworn, testified as follows, the topical plan of inquiry upon agriculture being followed:

Q. (By Mr. A. L. HARRIS.) You may state your name, your post-office address, and your occupation.—A. J. H. Hale. My address, I might say, is Fort Valley, Ga., and I also own and operate a farm at South Glastonbury, Conn. My business is that of farming.

Q. How long have you been engaged in farming?—A. All my life; I was born on a farm, and never followed any other occupation.

Q. Where did you first follow the vocation of farming?—A. In Connecticut as a farm laborer, by the month.

Q. How long did you follow that occupation in Connecticut?—A. I maintain it there now, in connection with my Georgia farm.

Q. How long has it been since you began farming in Georgia?—A. Ten or eleven years.

Q. What class of farming?—A. Fruit growing is my principal occupation, although I grow the incidental crops to the support of my farm; but fruit growing is the main cash income.

Q. How extensively are you engaged in farming in Georgia?—A. I am cultivating 2,160 acres.

Q. You necessarily, then, employ a great deal of labor?—A. During the entire year we employ about 60 hands regularly; then additional help as occasion requires—during the busy season on the farm from 500 to 700 people.

Q. Is that labor largely colored?—A. The field work of the year is nearly all negro labor. In the fruit season we employ a little more than half negroes, and

nearly one-half are white people, in the gathering and packing—the handling of the fruit.

Q. You may take up the plan of inquiry as you have it there, and answer each topic in your own way, and answer it as fully as you desire to.—A. Some of the questions, perhaps, are of very little importance, and, perhaps, you have been through them all before; I have tried to meet them as briefly as possible.

The first question is, "Increase or decrease of number employed in agricultural labor." I think there is a general increase of agricultural labor in the South. As to the conditions of that labor, my observation of 10 years is that it is steadily improving; that they are knowing how to live a little better, are living a little better, and are generally improving in their efficiency and in their manner of living.

Q. (By Mr. CLARKE.) Do you refer to men of both races?—A. I refer more particularly to the negro labor, as that is what I come most in contact with throughout the whole year. The white is the transient labor, which we have only in the fruit harvest, and I do not know so much about their home life, but they are improving in efficiency; they are more efficient than I supposed.

As to the third question, "Effect of improved machinery on labor," there is only a moderate amount of improved agricultural machinery used in the South, but where there is improved machinery used it is used with the greatest efficiency in agriculture, and increases the wages to some extent of those who are able to handle the machinery. So the use of improved machinery is increasing the efficiency of the laborer and also increasing his wages; but this is only in a moderate degree, because the machinery is not as freely used as it might be.

"Causes of irregularity of employment:" In the South this is because there is too little diversity of agriculture. The one cropping—cotton, the main staple there—makes a short season of a certain number of months when the labor is all employed, and the balance of the season there is very little for them to do. There is the one cause of the irregularity of labor. In certain months in the year much of the common labor of that section of Georgia where I am has very little source of income, very little to live on, if it has not saved it.

The question of "Transient labor in busy seasons:" Of course, my busy season might be different from the busy season of the cotton planter. My busy season in the fruit harvest, in June, July, and into August, is rather a dull season with many. Cotton has been planted and the crop mostly made, so we find an abundance of transient labor. Give out the word through the local newspapers, or in any way, and they come in far greater numbers than we can use. If we want 500, we can readily get 1,000. We have had no difficulty in getting all the blacks we want for the field work and heavy work, and also all the intelligent white people for picking, handling, and packing the fruit. We have had sometimes as high as 260 to 300 intelligent young men and women from the better class of homes of Georgia, South Carolina, Alabama, and Florida come to us to pick and handle the fruit, because it was a little cleaner, nicer grade of work and it was an opportunity to earn a little money—very largely people who had seldom earned any money before.

Q. (By Mr. PHILLIPS.) Young ladies?—A. Yes. They come in numbers; sometimes a whole family comes; sometimes 3 or 4 girls and 3 or 4 boys from a neighborhood come there. We furnish hotel accommodations where they can room by themselves. We board a portion of them, and a portion care for themselves—a sort of camping-out picnic for a couple of months. It is a better class of white labor than I would be able to get together in the North, in intelligence and good, moral behavior. Some come from the university town of Athens, and other college towns. It was a little outing and a chance to earn a little money at the same time. Transient labor is abundant, with us in the busy season.

Q. Do they do this gathering by the piece or by the day?—A. Our work is all by the day. We aim to do it very carefully, and we find we can not hold them up to as high a standard of efficiency by piecework.

Q. Do you make a difference between the women and the men in wages?—A. No; one who does the same work gets the same pay. The ladies do nearly all the work in the packing house.

Generally speaking, there is an abundance of labor for everybody that wants it, for a short time or longer, without any difficulty.

The hours of labor are pretty long in the South—too long, I believe. From 8½ to 9 hours in the shortest days in the year, and from 12 to 14 hours in the longest days in the year, but certainly an average of 11 hours a day of field work throughout the whole year.

"Average number of days employed in the year:" From 150 to 175 days of the year is about all the laborer can get on the cotton plantation. It is all-the-year-round work on fruit and truck farms, really a 12 months employment, except

when they want a little vacation at Christmas; while the cotton business gives only about 150 to 175 days.

"Tendency of agricultural labor to seek other employment." There is a general tendency among the negroes to wander a little, but drift back finally to the plantation and the farm. They really belong more closely to the soil than they do anywhere else, and the general tendency is to drift back to agriculture, although they go away. But there is only a moderate amount of drifting in the part of Georgia where we are—right in the black belt.

As to "Wages and method of payment," in our fruit and truck business, it is a weekly payment, in some few instances a monthly payment; but on the cotton plantations it is an irregular payment, a payment at almost any time when the laborer must have it and the employer can pay it, and a final yearly settlement at the end of the year. I do not know of a cotton planter in the South that pays regular weekly wages, and yet I suppose there are some that do so.

Now, as to the wages of colored labor and white labor—the two have to be separated somewhat. The maximum wages of the colored laborers with us is \$1 a day, and rather a high wage generally is 75 cents, while the lowest is about 40 cents, with an average in our section of the State of not quite 60 cents, I would say.

Q. (By Mr. CLARKE.) That is the wages of men?—A. That is the wages of men. The wages of children and women (I am speaking of negroes) will vary from 25 cents to 50 cents, with an average of perhaps 37½ cents. Now, coming to the question of white labor. In our experience in the fieldwork in the harvest we use mostly white men as superintendents, although we find some of the negroes who make efficient superintendents. To the whites and negroes who are superintendents, superintending the picking and running it in, we pay \$1 a day. In the packing houses we pay on the basis of \$1 a day for the standard day's work, which is checked. We check all the crates and the baskets, and the handling is done by the ticket system, and if they fall below the standard they are scaled from \$1; if they go above the standard they get that much more; so that probably 10 per cent fall below the dollar, both of men and women, and probably 50 per cent just about earn the dollar, while the other 40 per cent run all the way from \$1 up to \$2, according to efficiency.

Q. (By Mr. FARQUHAR.) How many hours do they work in the day?—A. Day-light to dark.

Q. Sunup to sundown?—A. Practically that.

Q. Is there any intermission for meals?—A. One hour at noon.

Q. (By Mr. PHILLIPS.) They board themselves?—A. Yes. I own a hotel building on the place, where we furnish them good and comfortable rooms and beds free of charge. We run a commissary department or table, where we give them good substantial board at what it costs us; we call it 10 cents a meal—\$2.10 a week. It actually cost us \$2.60 last year; but we give it to them at that. But probably two-thirds prefer to and do board themselves, thinking they can live cheaper than that.

Q. (By Mr. FARQUHAR.) Are your overseers usually all whites?—A. My permanent superintendent and assistants are white. They have under them foremen of different gangs of workers who are negroes, and very efficient men they are, too.

Q. (By Mr. PHILLIPS.) What kind of fruit do you raise largely?—A. Most largely peaches and Japanese plums. I also grow some of the finest varieties of Eastern melons, citrons, muskmelons, or cantaloupes, under different terms.

Q. You spoke of there being 2 or 3 months in the harvest season?—A. That is, the average crop extends over that length of time. By planting the earliest and latest varieties of the Japanese plums, which have an extended season, we get a harvest season from the last of May to, I think, the 10th of August—an 8 or 9 weeks, sometimes 10 weeks, season.

Q. Are they considered as fine in flavor and as good in quality as the New Jersey and Delaware peaches?—A. Very much better than any grown anywhere else in quality. The season is a little longer and apt to be drier. The fruit is a little drier than that grown at the North, but is richer and sweeter. As you go north and reach the northernmost limit of any fruit, they are more juicy and thought to be, by many, more luscious; but they lack the maturity and richness that you get in the extreme southern limit, where the Persian strain of peach may be grown.

Q. What about the size?—A. It depends on the system of culture and handling the soil.

Q. Is the same kind of peach about the same size?—A. About the same. It depends, of course, on the season, but with the same methods of culture there is little difference. They get a little higher color on account of the sun.

Q. (By Mr. FARQUHAR.) What are your facilities for handling this perishable crop?—A. We use refrigerator cars; we pack them in 6-basket crates—a crate which holds six 4-quart baskets, similar to tomato crates now in use in Florida. They are piled up with an air space between each one, and we put about 500 in a refrigerator car.

Q. Are the cars owned by the railroads?—A. No; they are owned by different refrigerator companies, and we contract with the different owners. The Southern Railway Company does own some cars, but we find we get better service, so far as the refrigerator cars are concerned, to contract with the refrigerator-car companies. The cars are reiced better. Some of our growers have taken the cars of the railroads and attempted to do their own reicing along the line, but there is an uncertainty and general dissatisfaction about it.

Q. Are your rates reasonable?—A. So far as the service given. The Central Railroad of Georgia and the Southern Railroad have aimed to give the growers most excellent service, and they have given us very fast time, and have had to charge a pretty good rate for it. I prefer good service first rather than low rates. They have aimed to give us very good service. The proportion of the Northern rates, in proportion to the Southern, is much the heavier. I come in contact in New England with the New York, New Haven and Hartford Railroad, and their rates are exorbitant as compared with the Southern. They aim to give us an excellent service and excellent terms; in fact, I have not a word of criticism as to their methods of doing business. As to the real value of the rates, I do not know enough about the value of railroad rates to know whether they charge too much or too little; but the Southern road gives excellent service and are willing to listen to our grievances. In fact, we have been sort of partners and worked together harmoniously. Our interests are mutual.

Q. Do you know whether you are getting the regular open rates of the railroads or a commodity rate?—A. I do not quite understand that term, but we get a special peach rate, that is made up. It is a special peach rate. We pay \$365 a car to New York.

Q. (By Mr. KENNEDY.) Where is it made up?—A. It is made up by the railroads previous to the opening of the season; they make it up among themselves.

Q. And there is no difference from that made-up rate?—A. No; it is all the same rate.

Q. (By Mr. C. J. HARRIS.) To all fruit growers?—A. The same to all fruit growers. The man who ships one carload has the same rate that I do if I ship 100 or 200.

Q. (By Mr. KENNEDY.) Have you only one line to ship on?—A. We have the Southern Railway and the Central of Georgia. We may go out of Fort Valley on either road, or we may go to Atlanta over either road, and then we can go to New York over the Southern as the quickest service, or we may branch at Macon over the Central, and it will take us around to Savannah, which is a longer distance, and put us on the Coast Line. They aim to take the fruit over the old Georgia road to Augusta and Florence and there hit the Coast Line.

Q. But, taking the direct line, there is no competition, practically?—A. There is the competition of the Coast Line and the Southern.

Q. The Southern is your more direct line?—A. It is the shortest line. The Southern and the Coast Line are the only two ways to reach New York. Of course there is the Seaboard Air Line, which tries for a little, but at present it can not handle it well. It is practically these two roads, and practically the Southern. I should say the Southern probably brought 80 per cent of the Georgia peaches to the northeastern section of the United States. Here at Washington it is all turned over to the Pennsylvania.

On the question of labor and prices of labor in the South, there is too much good and cheap labor in the South for its own good. It results in overplanting, spreading out too far, to the neglect of thorough agriculture, because labor is so cheap that it does not matter much how it does, because it does not cost much anyway. It is a temptation to overplant and skim over a great many acres and get poor results. It is also a temptation to neglect personal attention by the farmer or planter himself, because if the labor is not intelligently worked out or supervised it does not very much matter; it only costs 50 or 60 cents a day, and there is a temptation to neglect the best methods of modern agriculture; and therefore the abundance of cheap labor in the South is rather against the success of agriculture. If agriculture was not so good a business; if we could not get a living so easily, we would make more money out of it. That may be a peculiar statement, but it is warranted by the facts.

As to "cash payment, store orders, and payment in kind," there are a great many store orders given, because the planter has not ready money, and he can

make a deal with the supply store to supply him and pay at the end of the year. Some pay cash and some supplies are furnished by planters.

The fruit and truck farmers most largely pay cash, because they have cash coming in at more varied seasons of the year. Some of them pay partially in supplies. On my own farm we have always paid cash. For 10 years we have paid every Saturday noon in cash. I prefer to pay cash. The workers are better satisfied than by any other payment.

As to the tenant houses and tenant-house allowances, it is the general custom of the South to furnish the tenant houses to the laborers; in some instances it is furnished entirely free, and in others two days' work a month pays for it; but most of the plantations furnish a small tenant house and about 2 acres of land without any charge whatever to the tenants, and that includes fuel. On the plantations they nearly all have tenant houses without charge, and from 2 to 3 acres of land to grow what sweet potatoes and corn and other things they need for themselves.

Q. Is Georgia one of the Southern States which legislated on the subject of enticing laborers away from their employment?—A. It does have such a law.

Q. It has such a law?—A. Yes.

Q. Can you recall the substance of the law?—A. I can not. I have run up against it once or twice.

Q. Well, can you state the real object of the adoption of the law?—A. I hardly think I can. I suppose it really is the outgrowth of the somewhat roving tendencies of the negro, and to rather hold him in place, and, possibly, judiciously used, is a good law, but there also is the opportunity of it making some trouble; but I do not think it amounts to very much one way or the other.

Q. (By Mr. FARQUHAR.) Have you any knowledge of the traveling black missionaries there, who went in and out among their people there and made them discontented by these colonization schemes that were started throughout Kansas and other places? The men had no particular habitation where they were, but were kind of missionaries among their black folk, and held out inducements, in other words.—A. Well, what we call walking delegates?

Q. Of that character. Was the law particularly framed to meet that class of people who went in and raised discontent among the working hands?—A. Probably so; and if that was true, it was a wise law. I think, possibly, the law is not an unjust one in a general way, and did accomplish some good purpose. There was that class of tramp negroes who were not industrious themselves, and it was easier to live by trying to move others than to do anything themselves. But in a general way our labor throughout that section of Georgia is very content and permanent in its home life. They move about from plantation to plantation every 2 or 3 years—some of them; but to-day I have men on my place who were slaves on the place, living there during the reconstruction troubles, who were very much alarmed because a stranger came in and bought a farm. They thought they would have to move off, and they could not keep their old ways; but we let those people raise cotton for a few years, while gradually working them up to fruit culture. They have always lived there and will probably die there, right on the plantation where they were born.

The crop sharing, partnership, tenancy, etc., in the cotton business, which of course is the main business—it furnishes very largely the tenancy and leases of crop sharing. In either case there is too little of the owners' direct management, because with this renting and tenancy there is the tendency I spoke of before, of halfway work, neglect to look after it. The owner is sure of his land rent anyway, if any cotton is made, and it is easier for all of us to live easy if we can, and let some other fellow do it.

The question of loans to tenants, and liens on growing crops, etc. The owner of land always has a lien on the crop; that is, has a lien on the earnings of the tenants; so they work out their rent, while the landlord takes a lien on the crop. He is sure of his land rent anyway, and therefore he has not the interest to encourage the very best tillage to the very highest production, as he is pretty sure to get his share of it anyway, and if there is likely to be a failure of that, there is then more tendency to stimulate a little better culture, in the crop sharing, where the landlord furnishes the land and the mule, as against the negro's labor, and they share the fertilizer expense together. The landlord usually buys fertilizer, or gives security for it, and there is a lien on the crop for that also; and generally the year's supply of rations for the family.

Q. Does the owner of the land have a lien on the advances he makes in respect to living?—A. He has no lien at all. He does if he acts as the loaner. Possibly a local store may furnish it, and then take a lien on the tenant's half of the crop.

Q. (By Mr. C. J. HARRIS.) How much fertilizer is used to the acre as a general thing?—A. Far too little. There is one of the great troubles again of this cheap labor—spreading out from as low as 150 to rarely as high as 400 pounds of very low-grade fertilizer per acre. If it was fertilizer of the highest grade it might be all right, but the very serious hindrance to successful agriculture in the South is the use of low-grade fertilizer, and not fully understanding the economic value of using the highest grade. The South is overrun with cheap goods of every kind, made for the Southern trade. If any of you gentlemen know anything about manufacturing, you know there are certain things of low quality that are made for Southern trade. The South has been overrun and robbed with a low grade of products of every kind. Manufacturing companies put their goods there—and fertilizer is one of the main things at the present time—and all the goods they buy are mostly of a low grade, because they have not been educated to buy a higher grade of goods.

Q. (By Mr. KENNEDY.) You say the South has been robbed in that direction?—A. Yes.

Q. Is the South more to blame than those who manufacture for that demand?—A. Oh, both are to blame.

Q. It is willing?—A. It is a willing victim, because it is a temporary make-shift, and it is the penny to-day, then the dollar to-morrow. The poverty of the country has had much to do with it—the lack of ability to buy. The good Book tells us that "The destruction of the poor is poverty;" and the poor man has to buy cheap goods because it is the best he can do, and to-morrow he wants some more.

Q. (By Mr. FARQUHAR.) You do not mean to say it is imposition?—A. Of course, manufacturers are not moral agents and educators, and they give the people what they want to buy; but something is needed to stimulate the use of better goods down there.

Q. (By Mr. C. J. HARRIS.) Is it your experience that the land is pretty well worn out there?—A. Only just the surface is scratched off. It has never been tilled very thoroughly, and there is yet great fertility in much of the subsoil.

Q. (By Mr. FARQUHAR.) Is there any subsoiling?—A. It is a very decided advantage, but there are so many people who have a one-horse plow and a weak mule, and the land is just turned over, 2 or 3 inches of the surface, and that answers for plowing. Now, the opening up of the soil with modern implements, or subsoiling where it is necessary, means the bringing out in abundance of the plant food that is lying there and only wants getting out.

Q. (By Mr. A. L. HARRIS.) Your fertilizer is phosphate?—A. Well, to a moderate degree. A complete fertilizer contains phosphoric acid, potash, and nitrogen.

Q. You have your large phosphate beds in the South?—A. Phosphoric acid comes from the South Carolina rock phosphate, and is probably the cheapest source of phosphate in the South. The nitrogen is supplied from cotton-seed meal, but it is a low grade of fertilizer to use, and is only used in a very moderate quantity.

There is a tremendous high price charged for inferior goods; and there is a very high rate of interest that has to be paid.

Q. Is this fertilizer a part of the goods that are bought and a lien given for them?—A. Yes.

Q. What effect has that had upon both the landlord and tenant of the South—store liens?—A. Well, I do not know that the lien itself has any. It is a temptation to the man without business experience or business tact. It is tempting him to go on and tempt fate for a year, because he can be supplied. The lien itself is only to secure a just payment of a debt; but because the negro himself, or the white farmer can get a loan upon his crop, a loan upon cotton, he is tempted to plant more than he otherwise would, and he perhaps is tempted to buy more than he ought, that is, more than he has ability to pay. There is temptation in that, and yet if many of us could not get credit we could not do much business.

Q. What do you know about per cent of profits on the goods?—A. Well, I know that there must be a tremendous per cent of profit, and only in a general way; but I should say all the way from 25 to 50 per cent. The prices that I found there when I knew the real market value were, I should say, from 25 to 50 per cent; and one great trouble there is that there are too many people trying to get a living in small one-horse stores; in a town where there should not be more than two or three general stores there are a dozen. There is not enough business for all at a reasonable profit.

Q. (By Mr. FARQUHAR.) In the case where the owner of the land makes the contract, furnishes the mule and the fertilizer, or a portion of the fertilizer, for the black man, half of that crop instantly becomes mortgaged in the interest of the landlord?—A. Yes.

Q. Are there many blacks that farm on this crop-sharing system, and who get advances on their half of the crop from the stores, who ever get out of debt, or will they ever get out of debt as long as they live?—A. Well, many of them do have their debts lapse over from year to year; but I think a majority get a clean settlement once in two or three years, when they have an exceptionally good crop or prices are a little high; consequently excess prices are charged to make up for the small amount of sales.

Q. And then start over again, making new debts?—A. Start over again; yes.

Q. So they never get out of debt, practically?—A. Practically not.

Q. That is, those who go in the crop and lien system, and who have also the store-lien system?—A. Well, they get out of debt. I think the majority of them get out of debt each year, in October, but start in again in January with a new one. It seems to be the only way they know how to get along at the present time. There are others, of course, who have a moderate bank account and who do business on business principles. I was told by the president of a bank in our place a few years ago—possibly it was the cashier; it was one or the other—that the largest depositor in our local bank at Fort Valley was a negro farmer; he had the largest deposit there.

Q. (By Mr. A. L. HARRIS.) What rate of interest is usually paid on loans?—A. From 8 to 12 per cent, and sometimes a bonus besides; on a note it is usually 8 to 12 per cent.

Q. (By Mr. FARQUHAR.) What is the time of the note, usually?—A. It is usually from the spring months, when business begins, to October or November, at the end of the cotton season.

Q. (By Mr. A. L. HARRIS.) Is money scarce in the South?—A. Yes.

Q. What is the cause?—A. The majority of the bankers there who loan money have to get it from the North. There is not enough money in the South to do the South's business.

Q. What is the cause of that, if you know of any cause?—A. Well, I am not a financier and do not quite understand that. I do not believe I could answer it intelligently or satisfactorily.

Q. Does production have anything to do with the scarcity of money?—A. Well, they have been producing a crop there of cotton which has only just allowed them enough to eat it up every year. That is the trouble. There have not been any great accumulations by the majority.

Q. (By Mr. CLARKE.) Is there not a lack of capital?—A. There is a lack of capital. The capital is all tied up in land; it is land capital; it is difficult capital for them to borrow on.

Q. If there was as much wealth there as in the North, there would be as much money?—A. Yes; probably. Their capital is largely real-estate capital, and that of course ties it up.

Q. (By Mr. A. L. HARRIS.) Why is it difficult to borrow on real-estate security?—A. The uncertainty of the income from it; the uncertainty of the landowner being able to pay notes when they become due; and, in case of foreclosure, the difficulty of quickly realizing on the land. More and more money is being offered in the South on real-estate security at continually lowering rates of interest. I only speak now from surface indications, as what money I need I always borrow at the North; but I can see the general tone is that there is more money being offered at the South on real-estate securities at a lowering rate of interest. Money, I notice, has recently been offered at our own place at 7 per cent on real estate security.

Q. Do you look for that healthy condition to promise well for the future?—A. It is a blessing for some people to be able to borrow money, and it is a terrible curse to others. It is a misfortune for some to be able to borrow money, and the harder it is to get it, it makes them better off. Of course on broad general principles, the more money there is, and the cheaper the rate, better it is for the producers.

Q. (By Mr. FARQUHAR.) How frequently in the course of 12 months do you have use for money in the South in large quantities? Is it simply in the movement of the cotton crop?—A. It is in the movement of the cotton crop from September to March.

Q. First of all in your planting season, and then ultimately in your cotton gathering?—A. Yes; in the cotton gathering.

Q. So there are months in the year in the South that any banker might as well close up his doors, as there is nothing to be done?—A. Well, so far as there is any profit in his business; of course he does a little business at all times, but it is moderate. It is but a few months of the year that there is a movement of money to any extent.

Q. Would that account for the high rate of interest and small amount of capital you have there as floating capital for loans? For instance, you could utilize it nearly the entire 12 months of the year up North, and South only 2 or 3 months. Would that naturally bring a higher rate of interest down South?—A. Possibly some, but I think the uncertainty of the borrowers to quickly pay is the greatest difficulty.

Q. (By Mr. PHILLIPS.) Has land enhanced in value in a large part of the South, or has it been settling for quite a number of years?—A. My own experience as a farmer is that land values have been steadily lowering everywhere east of the Mississippi for the last 25 years, and I think it is no more in the South than any other section of the United States.

Q. Well, cotton lands suffered very materially after the war, when they had to employ labor to cultivate the cotton?—A. First; then somewhat of an increase in prices, and then a decrease in the last 4 or 5 years, I think.

Q. Have not some large plantations which were worth before the war \$100 an acre or more settled as low as \$5 or \$6 per acre?—A. I can not think of any that were worth as much as \$100 an acre that have settled at that rate. There are many plantations that were at one time worth \$40 or \$50 that have settled to as low as \$5 to \$8 per acre, but in our section of Georgia, for the last 10 years, there has been a rather steady appreciation in agricultural values—very little, but a slight appreciation in the value.

Q. Is that because of their being adapted to fruit culture, corn culture, and diversification of crops?—A. I think on account of the diversification of crops and more largely the development of peach culture.

Q. Is there a large section of the South or Georgia that is adapted to fruit culture?—A. Yes.

Q. A pretty large section?—A. A pretty large section; yes. A large section of Georgia and North Alabama, a section of South Carolina, and also Tennessee, are applicable to fruit lands.

Q. What kind of agriculture are you engaged in in the North here?—A. I am producing fruits entirely; in Connecticut; plums, peaches, and apples.

Q. (By Mr. A. L. HARRIS.) How large is your Connecticut farm?—A. Well, the acreage under cultivation is about 300. It is not all one solid block. It is hard to find 300 acres of land contiguous that you can drive a team over in Connecticut. It is rolling land; it is scattered fields, rough and rocky, and then we have to take the elevated lands for our fruits, because the frost will kill the buds in the valley in extreme cold weather in the winter; so we have to select extreme elevations.

Your other questions, 15, 16, 17, 18, and 19, are questions of immigration, of which there is very little in the South; practically none.

As to the twentieth—the colored labor and the extent of it—I should say 90 per cent of the agricultural labor in the South is negro labor; that is, labor that can be employed. My experience in handling labor both North and South is—of course in the North we use all nationalities—Yankees, Italians, Irish, Germans, Swedes, Poles, negroes, or anything else.

Q. (By Mr. PHILLIPS.) Not many negroes?—A. Not many negroes. They came there quite freely after the war, but most all of them drifted back South. I count that the negro labor of the South as the best agricultural labor in America to-day. I will recommend them way ahead of our New England Yankee. The Yankee boys we think are perhaps a little smarter for some expert work, but for agriculture throughout the year I think the negro labor of the South, at least the section where I am located, the Black Belt, is the best agricultural labor in America to-day, and I can accomplish more work for \$1 in Georgia than I can for \$3 in Connecticut, and get the same crop result. I do not know as I can get the same final result, but as far as labor is concerned I can get as good results for \$1 in Georgia as for \$3 in Connecticut.

Q. Is that because they pay so much less wages there?—A. No; in Georgia the average on my farm is about 65 cents as against \$1.25 in Connecticut. The extra advantage is in the efficiency and the honesty of purpose and the faithfulness of the negro labor as compared with what we can get in Connecticut. I went South with the idea that the negro was a rather stupid creature and could be used only in the grosser lines of work, and I have learned different by using them for a number of years.

Q. (By Mr. A. L. HARRIS.) You would not think, then, that the best interest of the South would be for the negro to be colonized in some other part of the country, or in some other country?—A. I do not know what the South could do; I do not know how the South could live without negro labor. It is the life of the South; it is the foundation of its prosperity; and the great future prosperity I see in the South, and believe in the South, is because they have such splendid labor

and such good labor. God pity the day when the negro leaves the South, or if they have to have labor from foreign countries to take the places of the negro.

Q. (By Mr. PHILLIPS.) Do they not require more serious direction in the work than the white labor in the North?—A. I do not think so. They need a clearer explanation at the start, and a more definite order. You can not leave as much to their judgment, but you give them a clear explanation of what you want, and a direct order to do it, then they will get along, and you do not need to follow them up any closer than you do the average white man; that is my experience.

Q. (By Mr. A. L. HARRIS.) Are they improving in efficiency?—A. Very much so, indeed.

There are one or two points I want to speak about freely. I planted my orchard very largely on borrowed capital. An orchard will give no cash returns for 3 or 4 years after it is planted. I needed an income; I needed money as quick as I could get it for the further development of the orchard. I looked about a little to see what might be done, and decided to grow some nursery stock, and so I planted largely of nursery stocks, planning when they had grown the first 6 months and were ready for grafting, that I would take some skilled men from the North, for about \$3 a day, to do the budding and grafting. When the stocks were apparently ready to work upon, my superintendent and myself went out to test them and see if they were in the right condition, and we began a little budding. Myself and the other gentleman knew the art of budding. We took along a couple of boys, 15 or 16 years old, to tie the buds in after us. When we arrived at the house for dinner we found business matters calling us to town, and we did not come back until nearly 2 o'clock, and we found those boys experimenting with budding. They were very much frightened. We examined what they had been doing and showed them a little, and they did so well at the first experiment that we spent the afternoon in instructing and watching them. The following morning we brought out 4 boys to tie for us. To make a long story short, the negroes worked into our budding or grafting so that we never had to take any skilled labor from the North, and we have been growing from one to three million trees a year, and they have been propagated and grown by negro labor. The men do all the work and they are aided in the planting by the superintendent. They do good work. We have men on the place who have put in 2,500 buds a day. Any of you gentlemen here who tried to do a little budding yourselves in the early days would know that it is pretty good work for the best, the most efficient men in the Northern nurseries, to put in 3,000 a day, and they want \$3 and \$4 for it.

Q. Are they honest and trusty?—A. Yes; I think so. They are like white folks in a good many things. A little instance of faithfulness: During the time of the Chicago Exposition my superintendent planned to go in September, and I was disappointed in going there. Some family sickness prevented my being on the place. After a little correspondence, I instructed him to go ahead and put the place in charge of one of the negroes in the field work, and told the other one to stay about the house, and look after the house and barns, as it was a good modern house and things needed looking after. The superintendent was taken sick in Chicago, and it was five weeks before he returned, and he wrote me that he found everything in perfect order as to cultivation and care. I went down a week or two afterwards, and I was thanking these two men who had charge, and one of the old darkeys who had been placed in charge of the house, said: "Captain, a heap of responsibility on dis old niggah. I knowed the boys on the plantations wouldn't make no trouble, but I se 'traid some ob dese town niggahs might make some trouble, so soon as I got through work nights, I got de old musket and kept up around the house till 2 o'clock evry morning; den I went and called Mose to feed de mules; and he watched out the rest of the night."

I never saw a man in the North who would watch my property all night without special contract and extra wages. And that same man, in common with one other man—when the great freeze in Georgia destroyed the life of the fruit trees, I knew that my only salvation was to get along with as few men as I could; and that old ducky came to me with tears in his eyes, and he said: "I know it cos' heap money to build up an o'chad when dey won't beah foh three o' foah years, and it is goin' to be a ha'd pull on you. Just what I want to say is dis: We want you to cut our wages down one-half, and we will work for that till the trees get big enough to fruit again."

Gentlemen, that brought tears to my eyes; when they said they were willing to work on half wages until the orchard began to bear again. There is faithfulness, and it is no wonder business goes on successfully when we have that kind of help, because it is loyalty for a man's interest that is worth something; and they have shown it in various ways.

Q. Are they temperate in their habits, as a rule?—A. I think the darkey likes whiskey if he can get it; likes it pretty well; but the Georgia law of local option of the counties is pretty well enforced. I think more than three-fourths of the counties of Georgia are prohibition, and the law is pretty thoroughly enforced. There is no liquor sold in our county, and really, I am never troubled by it. I am seldom troubled by drunkenness. But occasionally, in fruit harvest, outsiders we do not know anything about—we get occasionally a blackleg in the crowd, and they go to Macon, which is in a "wet" county, and get a jug; and I believe there have been two carousals by a few.

Q. (By Mr. PHILLIPS.) Do you find any trouble in melon patches, about losing melons?—A. No. We plant melons enough to feed all; land is cheap; labor is cheap; and we simply plant a large field of melons, and then we give notice to everybody that they must keep out of the melon patch; and as soon as the melons are ripe they are usually picked, and every morning we bring a wagon load to the house and barn, and extra wagon loads are driven around to the cabins and are divided up. We grow them for the purpose of feeding the help on the place.

Now, the question of pruning. The pruning of trees is scientific, and you can not let every man do it. We find the negroes are very adaptable, indeed. For instance, in this great freeze last year my superintendent took 10 men and instructed them; I took 10 more and worked with them, and in a few hours I got them onto the idea of pruning. We have 260,000 trees; the original 100,000 planted 10 years ago, the other 160,000 representing an increase of the past 6 years. We have done well in our spraying since we have had insects and fungi. We have to have some chemical laboratories for making Bordeaux mixture, and various sprays we use. We found no trouble in teaching many of our negroes what to do, and how to do it, and when to do it, so that they mix the solution and do the spraying.

Q. There is a possibility then, you think, of them becoming mechanics?—

A. Yes. We have our own carpenter shop, and a number of our buildings have been built by the men on our place. Our own negroes build cabins on the place; they built my original packing house, and they did it all, except a white foreman. The second packing house I built, they built entirely, and they do all the crude carpenter work. We have a blacksmith on the place who does good blacksmith work. Of course, he does rather coarse welding, but he can shoe a horse, if necessary, and keeps all the farm tools and machinery in repair.

Q. Is the character of your ground rolling?—A. No; mostly level.

Q. Does your water all come from springs?—A. Yes, and we have a force pump and force it up.

Q. (By Mr. A. L. HARRIS.) Is there a disposition among the colored people to accumulate property?—A. No. It is the hardest thing in the world for a darkey to keep anything. They want to spend it. They are simply children, and they will do anything you tell them to. We could pay them one-fourth of their wages every week and keep the other back, if we desired to, without any serious protest on their part. We do urge upon them, and in a measure insist upon their saving a portion of their wages throughout the year, and when it comes Christmas time they want that surplus, and if we can encourage them to buy some staple article of household furniture or some staple necessity, we do so, and in that way they are furnishing their houses a little better each year.

Q. Do they take good care of your tenant houses?—A. Fairly good; yes. They have mostly been unpainted. Two years ago I told them that if they would keep them painted we would furnish the material if they would do the work; and it was very much to their delight, and they are now keeping them painted, and we are furnishing material and the other expenses, and they rather take a pride in painting them.

Q. Do they take good care of your tools?—A. No. They are very careless and will leave them anywhere and everywhere, and we have to have very strict discipline to make them take care of them. They have a tendency to drop a tool anywhere when through with it.

Q. (By Mr. PHILLIPS.) What kind of houses do you build for a tenant house, as a rule?—A. The original plantation houses of the South, I regret to say, were mostly 1-room affairs, 20 or 25 feet square, and those were mostly of logs. The modern house is a frame house, boarded and sheathed, with 3 rooms—a general family room, which is used only to put the family beds in, and then a separate bedroom, and a kitchen. The general modern tenant house now is a 3-room house.

Q. Have you the inside of the places sheathed?—A. They oftentimes do paper these, but generally sheathe them; at least mine are sheathed, in all of them.

Q. (By Mr. CLARKE.) Do they have cellars?—A. No. There are no cellars under any of them, and there is scarcely a white man in our county—so far as I know

I have the only house in the county that has a cellar under it; but I presume there are some others; but the large plantation houses have no cellars under them whatever, which is a very great mistake, I believe.

Q. (By Mr. PHILLIPS.) There is no climatic reason to prevent them from having cellars?—A. Yes; it is a climatic reason; they are not absolutely necessary; so they do not have them, because they can get along without them. They do not know the value of them for cooling and caring for their family provisions in the summer, and for making the house warm for winter use.

Q. (By Mr. FARQUHAR.) Independently of the advantages of the cellar there, do they not usually utilize the small springs and the springhouses, and also the smokehouse?—A. They do not have enough of them.

Q. But usually on the large plantations they utilize them?—A. Yes.

(After a recess from 1 to 2.45 p. m., the hearing of Mr. Hale was resumed, as follows:)

Q. (By Mr. A. L. HARRIS.) When we took a recess we were on the topic of colored labor; have you anything further to say on that topic?—A. I think I covered it pretty well this morning. The point I wanted to try to make at that time was that in the skilled or semiskilled work of either pruning and propagating or gathering of the fruit it requires a higher class of labor than the ordinary work of the farm. We found the negro abundantly able to carry his share with any other man; perfectly satisfactory.

Q. Then you may pass to the sufficiency of the public school facilities.—A. The public school facilities of our section of Georgia are very good, considering the amount of money that they have to put into them; they are very good, indeed, and are steadily improving, both for the whites and blacks.

I am not sure what the law is as to compulsory school attendance, but there is certainly an apparent lack of compulsory attendance on the part of the blacks. I am not sure that there is any law that empowers local authorities to force them to go to school, as they do in other States, but I judge that not more than 60 per cent of the black children of school age do attend school, or if they do it is only a very short season of the year. That seems to be the trouble; but there is a larger per cent of whites that do attend—much larger per cent.

Q. What is their capability as to learning?—A. I think they are as bright as the average of children of any nationality, under the conditions which surround them. We find they are quite bright. We have at one time had a private school on the place so that they might have more schooling; and I occasionally went in there and I found that they were as bright as the average of school children. Of course the facilities are not nearly as ample as at the North, but I think they are capable of a reasonable amount of education.

Q. Is the course of study adapted to the needs of the people in the country?—A. It is a general education, a general education in its simplest form; but to my notion the whole need of the South, both black and white, in the common school is, of course, the rudimentary education as a foundation and, I believe, some simple text-books perhaps not directly pertaining to agriculture but in the line of agriculture, because it is the only way that you are going to reach those people with a practical education. The only opportunity they are going to have is in the common school. It seems to me, whether in connection with the courses of reading or how, but in simple language, perhaps to teach agricultural chemistry, as in the general rural-science series which is now being published—King on the Soil, Bailey's Plant Breeding—Roberts on the Fertility of the Soil gives the whole foundation of plant life; and Voorhees on Fertilizers, which is in simple language; and one particularly important in the South is on Leguminous Plants and Nitrogen, by Professor Hildgard, of the University of California; those are simple text-books, and yet deeply scientific and so practical that a very simple mind would get considerable from them. I do not know just how they would go into the course of study, but some one of those, or a number of them, ought to go into the rural schools of every section of America; and there is more need of it there than there is in any other section of the country, and it would be very valuable aid to those people. A majority of those people for a good many years are to get their living out of the soil; the wealth of the South largely lies in its soil, and that wealth will be brought out only by intelligent agriculture.

Q. That applies to white as well as colored?—A. Oh, I am referring both to white and black.

In the way of technical education, in the State of Georgia there are two institutions of a moderate degree of efficiency, one at Atlanta and another at Savannah, and I think there is one for girls at Milledgeville. I do not know very much about it, but I know there is a little opportunity; and the State University of Georgia, which receives the agricultural funds from the Government under the original Morrill Act of 1862 and the supplementary one of 1890, is a classical insti-

tution, but aims, of course, to do enough of agricultural and mechanical education to be enabled to receive that money, and that is about all. That is the trouble in a good many States. That money is not applied where it ought to be. It is misapplied; but I am not saying any more so in Georgia than in a number of other States of this country. Someway or somehow Congress ought to see that that money is used as it was intended to be. There are a few agricultural students there at that college and always have been, but agricultural education is not magnified as it ought to be. The general line of classical education in the South, and technical in a moderate way, is all tending to lead them away from agriculture instead of toward it; and the idea has been—not any more there than in any other section—that if a boy or a girl could get a little classical education they were going to be enabled to get a living in some way without working. But I believe if that same idea was applied to the education along agricultural lines, that there is a chance also to get a good living as easy as you could get it anywhere else, and be a king among men. I believe the best opportunity anywhere today for education lies along agricultural lines, and I believe a young man's chances to-day are better. And if our young men who are in Yale and Harvard, or high-class colleges of that kind, would put the same energy, same study, and same effort into a scientific agricultural education, and then apply that to their business as farmers, their chances of making money and getting ahead in the world are greater than they are in the professions. I would like to see some means arranged whereby the agricultural funds, so called, from the National Government would be applied directly for that purpose.

Q. Has the agricultural college been successful in number of students and financial support?—A. Perhaps not. Kansas and Michigan are doing very well; perhaps the best in the country. Those are turning out a goodly number. Michigan is a marvelous success, and is turning some bright men out over the country. Kansas has done exceedingly well, and some of the other States.

Q. (By Mr. FARQUHAR.) Is not the success of the Michigan college due to the excellent foundation they originally gave it, being purely agricultural?—A. They caught on to the real idea of it at the start. The majority of the States at the time the first appropriation was made had not begun to realize that farming was anything more than mining—digging a little something out of the soil. To-day we go on the theory that it is a scientific business as much as manufacturing, as making and selling goods or hardware, and it needs an educated man to properly carry on the business. Michigan was one of the original States that saw the need of it; but the other States turned it over to their various classical institutions, and, of course, they had not a management who took any interest in the agricultural side of it. They were teaching the classics, and so that helped out along that line; and people were not led up in the way they should have been. When this new fund came along in 1890 those same institutions went out and gobbled it up wherever they could.

Q. Have not you an agricultural society in the State of Georgia?—A. State Agricultural Society.

Q. Why does not that foster this same idea of making a distinct school and utilizing this money under this law for it?—A. The matter has been agitated in the State both by the leading agriculturalists and by the society, but you know the powerful influences that are always at work. The graduates of the Georgia University are in the law offices; they are in the newspaper offices; they have the power to control public opinion, and they do it. And Georgia is no worse in that respect than a great many States; not at all.

Q. (By Mr. A. L. HARRIS.) The complaint is pretty general?—A. The complaint is pretty general. Of course we have the Macon Institution, which is an educational institution also, and it is doing splendid work. I believe myself that, as many of the Southern States are comparatively poor and unable to do as much as they would like, if this agricultural college fund were used throughout the Southern States in a series of agricultural institutes such as are provided in some States, it would accomplish a wonderful uplifting. Keep it out of politics; put practical and scientific agriculturalists traveling about the State and holding meetings here and there, where you could get a dozen or 25 farmers and boys together; call in the school children, and carry it to the people; and if you could once get a thirst for that knowledge, it would take care of itself. I believe the national fund could be better used in a great many of these States, Georgia in particular, and others the same, by carrying to the people some form of agricultural interest in that particular.

Q. (By Mr. C. J. HARRIS.) Do you know of any successful farmers who are graduates of agricultural colleges?—A. Yes; I know of a number in Massachusetts, Connecticut, Michigan, and New York State.

Q. Do you think they succeed as well as those who have not gone to the agricultural colleges?—A. If they have, in connection with the education, a love of the soil and the business ability that the other man possesses, they far outstrip him. The mere fact that they have an education will not make successful farmers if they have not a taste for the business and have not the same business ability that they would have to put into any other business to succeed.

Q. Do you think they are more successful on account of that training?—A. Yes.

Q. Have they proved it so in actual life?—A. So far as they have had an opportunity to prove it, it has followed in proportion as with others in other professions. There are many doctors and many lawyers and many managers that make a wonderful failure of their profession; but the education is not at fault; it is the material you have begun on; and if you begin on the wrong material to make an educated farmer, you can not make a brilliantly successful man out of one that would make a failure anyway.

Q. (By Mr. A. L. HARRIS.) You may state to the commission, if you will, what the opportunity for capital is to earn something in the South invested in agriculture.—A. I think under intelligent business management that capital has as good an opportunity in the South as in any section of the United States. I am under the impression that in many lines it has a better opportunity, on account, of course, of the cheap labor and the cheap land and the long season in which work may be carried on. Of course there are specialties in different sections of the United States where a man can do better, but on an average investment in agriculture, it seems to me to-day that there is a brighter outlook for it in the South than anywhere else.

Q. In the South is it as good as capital invested in banking or manufacturing or merchandising?—A. Well, of course I can not speak from actual experience, as I have not been in any of those lines of business and am not closely acquainted with it. For myself, I should rather take my chances at agriculture, of better dividends. I believe with the same equipment for agricultural business that a man would have to put into manufacturing or banking—say mental equipment—that a farmer has a better chance on an average.

Q. (By Mr. C. J. HARRIS.) Is there any profit in watermelon raising in Georgia now?—A. No; it has been overdone. Occasionally a few will make money, but on the whole there is no profit, or very little.

Q. (By Mr. A. L. HARRIS.) What have you to say in regard to the taxation of agricultural property?—A. The taxation of agricultural property is not excessive in the South; it is on a par with real-estate holdings. But in Georgia, and everywhere else, real estate pays more than its equal share of taxation; but that does not apply to agricultural real estate any more than to any other real estate. It simply seems to be one of the unfortunate things of taxation that real estate, wherever it is, pays the taxes and the other property does not. But I do not think agriculture is paying in excess of any other real estate. Taxes are moderate there. Perhaps if they were more, and used more for the public benefit, it might be better.

On this question of taxation, as to suggestions for modification and unification of tax methods, etc., it is a pretty hard proposition. But I have always had in mind that there should be a uniform law in every State that would require the listing of all property that a man owns once a year; a listing of everything he owns in the world. You can exempt as much of it as you like, but once a year, under a very severe penalty, a man should render an account of all he owns in the world.

Q. Tangible and intangible both?—A. Yes; once a year, and then we will see what will escape. But once a year the citizen should go before the proper authority and make oath and put on record all the property he owns in the world. And I am rather in favor of an income tax.

Q. (By Mr. CLARKE.) In the States?—A. In the States. I think that an income tax is certainly a just tax, a fair tax to everybody; and I believe in some sort of an income tax. I believe myself that a graduated income tax is not unjust, but I would have everybody a taxpayer. I think the humblest citizen, the man working for the smallest wages, if he paid a little bit of a tax, would have more interest in his local government and in his State government and be a better citizen and look a little sharper after how the money was spent. I would make it very light on one with a limited income, but I could like to see that done—a graduated income tax that should touch everybody.

Q. (By Mr. PHILLIPS.) Do you not think that there are a great many persons engaged in business whose incomes it would be impossible to tell each year?—A. Well, I would not ask a man to swear to an impossibility, but a man can come pretty near knowing what his income is from year to year.

Q. In the case of great banks and great industries, where persons are running rolling mills, for instance—have a large amount of money out—they often lose very largely, and in this year it would be a loss to them.—A. Well, if you do not have an income, you can not lose what you do not have.

Q. They have an income, but it is out in paper that is not due. Is that to be put in as an income?—A. Well, they would not put it in. If it was uncertain or of doubtful value, you would not count it.

Q. Very frequently it is carried down in the banks as loss.—A. I do not think anybody would be compelled to pay taxes if they did not have the income.

Q. There is another case, in which persons engaged in the manufacturing business make a very considerable amount of money in one year and yet have a very large debt—carry a very large amount of borrowed money. Does it not affect their credit very frequently if they give their income one year and do not give any the next year? Are not they liable to fail, because creditors will desire to collect everything they can?—A. No, I think not; for a man's credit stands largely on his moral character and his uprightness in doing business and whether he does his business squarely and in a straightforward way. I have found in my own experience in a limited way in dealing with banks and bankers that they want to know what you are doing as an individual—a clean, straightforward way of doing business, whether it is up or down. Now, in Georgia this year the frost came along and wiped everything out. Not a dollar of income in 1899, whereas in 1898 there was a large income.

Q. It was stated as to the income tax, the war tax, that persons would give in an income one year, and failing to make any income the next year, would give one in to sustain their credit.—A. Well, if they are as shaky as that, let them go down; but I do not think any square-toed, upright business men have got into difficulty by having the public to know the facts. I think they stood stronger. I think to keep it covered up is an injury to the men. I think a straightforward, open understanding of things is better for honorable business men.

Q. (By Mr. FARQUHAR.) Do you not think that if there was an exposé of the credit of individuals and firms demanded by the State, that it would really be injurious to the credit of a great many concerns that come to bad debts and bad markets and slack times and must go to the banks to tide over, and temporarily assume debts that did not belong to the prosperous years? Would it not be apt to shake the credit of persons and firms with the bankers, and even with the general public?—A. It might with a very few, but I do not think enough so as to affect the business interests of the country at all.

Q. Do you not think that half the business of this country is done on credit?—A. Oh, probably more than that.

Q. But we will say safely half.—A. Safely half, and probably more.

Q. And credit is one of the most touchy things in the commercial world—the easiest thing that can be overturned. Would not that be the difficulty in these State income taxes? In the second place, the weakness very often of individuals and firms who, without thus having to expose that weakness, could swim through and ultimately recover in the succeeding year or a few years after—would it not tide over, as it were, a good many difficulties that every man has in his business?—A. It might tide them over.

Q. Have there not been times in your own life that you would not care that everybody would know?—A. I have been in some very tight places. I have been in the mud a good many times very deep; but when I was deepest in the mud and things were the worst off I always went to my bankers and told them the very worst of everything, and I found I had no trouble in getting on.

Q. But if you were in a position in the city of Macon with four or five men in the same business actively competing— —A. (Interrupting.) I would be willing to risk it.

Q. (By Mr. PHILLIPS.) Is there not another class? Where a company is engaged in business with not a very large capital, as a good many industries of this country are, and they give in an income that is a very large income to the capital invested, and capitalists see that there is a great profit in this business, and they put in a very much larger capital than the thing demands—than the concern does—may they not be bankrupted by exposing their business to the general public?—A. The trusts are doing that now anyway.

The question of migration—there is very little migration from that section to other parts of the country, except some farmers go to the Southwest, where they think the land is more fertile, Texas and Arkansas; but they are very few in number.

As to the decline in prices of agricultural products, there is a general decline, but, with the exception of cotton, I question whether the decline is any greater

than it is in manufactured goods and supplies that a man has to buy; so that one offsets the other. I think, with the exception of cotton, that the general decline of agricultural prices has been kept pace with by the manufactured products and the general supplies a man has to buy.

As to the decline of agricultural lands, which we touched upon this morning, in our section of Georgia it is slowly increasing in value—very slowly, but surely increasing.

Q. That is, since the great decline it is beginning now to advance?—A. It is beginning somewhat to advance.

Q. From the great decline several years ago?—A. Yes, that general decline; and that general decline was both on the Atlantic coast and along the Mississippi River. But there is land within 20 miles of Washington which is cheaper than it is in the plain of Kansas, and it is actually better for people to buy.

Q. (By Mr. A. L. HARRIS.) How do you account for that?—A. Well, the advertising and the hurrah for the West and all that, and the people here not readily adjusting themselves to the new agricultural conditions. They were living on the old-time agriculture of Maryland and Virginia, and the people have not, enough of them, readjusted themselves to the new conditions. There is wonderfully fine land in this immediate vicinity that is certainly going to be worth a great deal, and the land is here, money is here, and the market is here for a class of products that the Westerners can not grow.

As to the decline in the productive condition of the soil, I touched upon that this morning. The surface of the soil of the South and of the whole Eastern country, the South particularly, has been skinned over and over again, and it is a desolate-looking land. Down deep it is rich in the mineral elements that are needed for plant production. It is a country where the grasses do not naturally grow, and it has been left bare a great deal of the time after the crop has been taken off, and the nitrogenous matter and the organic matter has grown out of that soil. There is no question about that—that it is lacking in nitrogenous matter. But by deep plowing and starting a new condition of the soil you are going to favor it by furnishing everything in the way of potash and phosphoric acid that seems to be needed for a great many years, and by growing the green crops and leguminous crops that have the ability to gather nitrogen from the air; all the nitrogen that is needed may be gathered.

Q. What leguminous crop do you grow in Georgia?—A. The cowpea is the best, and the Japanese soy bean; and there is another, the velvet bean, that is said to be the best of all, but I have not tested it.

Q. Is the reproduction rapid under that treatment?—A. Oh, yes; you can build up land wonderfully, to my notion.

Q. (By Mr. PHILLIPS.) How do you build up the land in that way—by plowing it under?—A. By plowing under those green crops and those sorts of plants that have tubercles on the roots and have the ability to absorb the nitrogen from the air. And when they have got their growth, by plowing them up they have put their nitrogen in the soil, which is the most costly element of plant food. The potash and the kainite cost 5 cents a pound; phosphoric acid costs 7 cents; the nitrogen costs from 16 to 20 cents; and yet they need not buy a dollar's worth of it. That most expensive of all elements of the raw material is in the air. In a moderate way they do grow these plants there, and they get some seed. They rarely plow them under, and they save some seed to sow next year; and by plowing under the plants, stubble, and roots, the next year they get some wonderful crops. I have seen some cornfields in Georgia which, I am told by old planters, by planting the corn 5 feet apart and then ripping out the middle and sowing peas and letting them grow until the frost killed them in the fall, and then plowing under, and the following year bedding up over there, and planting a row of corn there, and having the cowpeas in the middle where the corn row was before—that for 50 years there have been corn crops taken off that land without the application of any other fertilizer.

Q. In a moderate way?—A. Only in a moderate way, yes; but instead of planting such a moderate acreage as they did, and leaving the land bear year after year, and letting the sun burn the nitrogen out of it—if by deeper plowing and better tilling they cultivate the land and by using more fertilizers, and have the balance growing with a leguminous crop, to build up the rest of the land, why, there are wonderful possibilities. On account, I say, of the cheap labor it is easily done.

Q. (By Mr. FARQUHAR.) Is there any plant food returned at all from the cotton plant?—A. No.

Q. Takes everything out practically?—A. Takes everything out. It is only this type of plants that have the tubercles on the roots. The cowpeas, the

vetches, and the soy beans and the clovers are about the only class of plants that collect nitrogen from the air. The clovers do not ordinarily grow very well in the South.

Q. Ordinarily how long does the pasturage last in the South?—A. What do you call pasturage? There is not any pasturage; scarcely none at all. We are below the limit of the English grasses; none of our best English grasses grow there. In our bottom lands in certain places the Bermuda grass grows, but it is killed by the first frost in the fall.

Q. Then there is not much use for dairying down there as to the growing of grasses?—A. Not as the Northern man dairies; but it is good for a class of feed.

Q. What class of feed do you supply in place of our grasses?—A. Corn fodder and pasturage—the Bermuda grass and the cowpeas, and plants of that kind. We make our hay—I will touch that a little later on another line.

Q. (By Mr. C. J. HARRIS.) Can you raise any hay there?—A. Oh, yes.

As to the increase in the acreage under cultivation, I think there is practically little advantage in the increased acreage. There is too much under cultivation anyway, but there is a change going on from cotton to fruits and vegetables of various kinds. There is considerable change in Georgia and the change is all for the better, and the more of it that is going on the better.

Now, question 34, "Its effect on production, on prices, and on profits." This change increased the value of production from 200 to 1,000 per cent; it increased the cost of production also, and so there comes the question of profits that the chairman was touching on a little while ago. While the profits are all the way from nothing up to 10 times the cotton profit in different years, it is uncertain. The average is good, but some years it is nothing and other years they are moderate, and other years they are excessive. It is uncertain, but uses more labor per acre and requires more skilled labor, which makes higher wages.

Q. (By Mr. PHILLIPS.) You are pretty well supplied in that climate with rain, are you?—A. Yes; the rainfall is somewhat greater than it is here, but it is a little precarious. We have some severe droughts. Here is a point in the changing from cotton to the finer fruits: An acre of melons or fruits gives the railroads 15 times the tonnage an acre of cotton does; 15 times the tonnage per acre over cotton to the railroads; and while I do not know what cotton freights are, they also give the railroads a higher price per ton besides giving them 15 times as much freight per acre. We pay them a higher price per ton for the fruit; so it is certainly a decided advantage to the railroads to have a change in the crops. Of course, they make various rates on the different fruits. Watermelons they bring at a very low rate because they have had to do it or they could not do any business at all. On our higher grade fruits, fine fruits, they charge us a very heavy rate; as I told you, \$265 a car to New York City, and \$90 more to Boston.

Q. (By Mr. A. L. HARRIS.) About how many tons do you ship in a car?—A. Well, about a 24,000-pound car.

The question of bonanza farming here—that has not got hold down there to any extent, in fact not at all. There are of course some large cotton planters and some very large fruit and vegetable farms.

Q. (By Mr. PHILLIPS.) Is that proportionate to the rate charged from California for California fruit?—A. No, we pay far more than California does proportionately.

Q. (By Mr. C. J. HARRIS.) Speaking of bonanza farming, can a man run several farms, or let them out to renters, and make interest on the money invested in those farms, do you think?—A. I could not do it myself. If I were to attempt to do it I should want to take the management and hire the labor and pay for it, and have absolute control, rather than to risk it with renters. I think a man can go South with capital, manage it himself and hire his labor, and can make splendid dividends on his capital. I think there are a number of opportunities in various lines which I will speak of in a few moments where I believe a man can make from 10 to 20 per cent in the South if he manages them himself and if he would apply himself closely to details.

Q. You mean apply the same business methods?—A. The same methods; the same brains, that must go into any other business to be successful.

"Organization of the farmers." There are no permanent organizations of the farmers covering the whole State. There are local organizations there. At one time the Grange and the Farmers' Alliance were both there, but both tumbled into politics, and thought they were going to benefit agriculture entirely by legislation. They began at the wrong end. If they had made them educational institutions for the farmer and taught them to mind their own business and become better business men they would have succeeded better, but where they

tumbled into politics as they did, particularly in the South, they all went down. I do not believe that either the Alliance or the Grange has a subordinate organization in that State. They have a State agricultural society and a State horticultural society. The horticultural society particularly is a live, practical institution, with a membership of 300 or 300 in different sections of the State.

Q. (By Mr. A. L. HARRIS.) On a nonpartisan basis?—A. Certainly. You can not do business on a partisan basis. The Grange as an organization is doing splendid work in some States where it is working as an educational organization. It is doing splendid work in many States of this Union; there is no question about it. It is the best farmers' organization that there is in America, and it is a useful organization and it is doing a great deal of good. But in some States where it was thought the only way it was going to improve agriculture was to be in the statehouse there and the Capitol here, it did not do the farmers any good or help them very much; but taking the organization as a whole it is a good thing. In Michigan, New York, California, Pennsylvania, Ohio, New Jersey, and all the New England States the Grange is doing grand work for agriculture. You may help or hinder it in a moderate way, but most of it we make ourselves. I do not believe you can ever legislate prosperity into any particular class of individuals entirely.

Q. You think the farmer can not help himself by going to the corner grocery and whittling on a box?—A. Well, he may have a little fun out of it, but I do not want to do business that way.

On the question of organization, I believe there should be organizations of farmers for educational purposes and they should be in every community.

As to cooperation the farmers can cooperate in a moderate degree in production—not very much; but they can in finding markets and distributing their crops. There is the most important chance for farmers to cooperate in a business way; in the even distribution of their crops. Cotton, of course, is a little different from some of them, because that finds certain markets anyway; goes through certain channels.

"Present production in relation to consumption and existing markets." I do not think there is enough study among the agriculturists of the South as to the market conditions of America and what they demand in the home markets particularly. Now, Georgia is buying hay; Georgia is buying corn and meat and canned goods and dried fruit and so on, and mules—that she profitably can produce at home every one of them. I do not know about mules; how she can produce them; I question whether Kentucky and Tennessee can not produce them cheaper, because it is a natural grazing country there; but Georgia is buying train loads of these things, and she ought to produce herself all the hay she wants, all the corn and all the meat and canned goods, dried goods and all those things. Atlanta, Macon, Savannah, and all the small towns over the State are buying baled hay from the North, and I have never known any home-grown hay to be sold there. I do not say it has not sold, because I have never watched the market, and I have not had to buy it; but I have never known outside hay to be below \$16 a ton; and corn at about the same price as in the high-priced northeastern markets where no corn is grown.

Q. (By Mr. PHILLIPS.) What do you chiefly raise for hay?—A. I raise the natural crab grass hay, with cowpeas. For instance, I take out a crop of hay and leave that land to itself; the next summer it will be bare; nothing green growing on the land; then plow it in midsummer; midsummer down there is June or the 1st of July; and the crab grass will grow up as thick as weeds, and by sowing one-half bushel of cowpeas per acre at time of plowing, I will have a splendid crop of hay.

Q. Is that as good as the Northern hay, baled hay?—A. I never have analyzed it, but I know that from the way it puts a glossy coat on horses and the way the Jersey cow gives down rich milk, it is as good as the timothy and clover hay we have at the North.

Q. Are your cows bothered much with ticks in that climate?—A. No. I only keep enough for my family so I can have milk and cream.

Q. (By Mr. A. L. HARRIS.) Is the hay as cheap as it is in the North, that we feed cattle?—A. Of course, in the North it can be grown cheaper, without the expense of delivering it; but down there you must set that down and add it to the cost of the hay.

Q. How deep do you plow?—A. I plow about 8 inches. I do not know of many of my neighbors around there, with a few exceptions, that plow more than 3 or 4.

Q. (By Mr. CLARKE.) You plow about as deeply there as they do anywhere in the country?—A. Yes. Not all of my land is plowed 8 inches; with some soil it is not well to turn up as much as that; it is a light brown loam on the surface

and red clay subsoil. Sometimes it is not well to turn up so much of the subsoil at one plowing. It is better to plow a little deeper each year.

Q. Do you you plow your orchards?—A. Oh, yes; do not plow them as deeply, but the orchards are kept thoroughly cultivated every year; every inch of the land.

Q. Thoroughly fertilized?—A. No, only moderately fertilized. I went there with the plan of using many thousand tons a year, but I found that there is fertility enough in the land to grow beautiful trees and beautiful fruit if I only stirred it up and got it out.

Q. But such a thing is necessary in that line?—A. In the course of time; but it would be unwise, it seems to me, for a business man to buy phosphoric acid and potash to put on that land when there is enough in there to last 100 years; so I would stir up the land and bring the particles together to get this chemical action which comes from those minerals. Have any of you ever been up to General Bidwell's place in Chico, up near Sacramento? He was a candidate for President of the United States. He is one of the nicest men in America, and he owns 40,000 acres of land in the Sacramento Valley. He does business on a tremendous scale, gang plows running by steam and turning over 8 furrows at a time, and when it is done the wheat is broadcasted and hurriedly harrowed in. And on a little corner taken out of this farm there is 500 acres owned by a woman, and this land is plowed by a single team of mules and a good stiff plow, and turned over well and then it is harrowed well and cross-plowed, and then she harrows it again and smooths it down. For a number of years General Bidwell's average yield of wheat has been 15 bushels to the acre, and Mrs. Jones's has been 35. There is a tremendous lesson to the farmer on the fertility of the soil. She has more than doubled its productive capacity by better cultivation, and they have not even thought of nominating her for President yet.

Q. (By Mr. C. J. HARRIS.) Does she use any fertilizer?—A. They do not either one of them use any fertilizer; it lies wholly in the deep and more thorough stirring of the land over and over again.

Q. You do not think that could be kept up for years without the use of fertilizers?—A. Yes, I do. I believe that a large majority of the land in America to-day has mineral elements enough in it to last for centuries, and by supplying nitrogen in any way you like, but most cheaply by taking it freely from the air, I believe the fertility of much of our so-called worn out land in the Atlantic coast States can be made to increase; the productive value of our lands may be made to increase through intelligent practical agriculture.

Q. (By Mr. A. L. HARRIS.) Would that apply in New England as well?—A. That applies in New England.

Q. (By Mr. FARQUHAR.) Is not the character of the crops which have been uniformly grown in this section, through Maryland and elsewhere—the cotton and tobacco—such that they have exhausted the soil thoroughly?—A. Well, certain crops, of course. Both of those crops would take a good deal of potash.

Q. Continuous cropping has been the custom there; no diversity or variation in cropping at all?—A. Rotation of crops will strengthen the land; there is no question about that. I say still I believe I could take any man who wants to go at it right, and get good tobacco and cotton continuously out of the same land, and at the same time maintain the fertility of the soil.

Q. You have that in Connecticut?—A. Yes.

Q. You find that among the Connecticut growers of tobacco?—A. No, not many; not very many of them. It is easier to buy a little more fertilizer; but in the Connecticut Valley, where they have been growing tobacco all my life and before, the land is more fertile to-day than it was 30 or 40 years ago.

Q. By artificial means?—A. By artificial means. I do not want you to think that the lands in the Connecticut Valley are going back; they are more fertile than ever; and that is done by buying outside fertilizers. The tobacco has not exhausted the Connecticut Valley; it is richer than it ever was.

Q. (By Mr. PHILLIPS.) Do you mean that the soil would be richer by growing crop after crop of tobacco every year without fertilizing?—A. No.

Q. There is no way of keeping it up but by using the fertilizer?—A. I mean to say that it has grown richer there by using fertilizers. But here I say we could maintain the fertility, and much of the land in Virginia and much in the South could be made over and improved from its present condition, by plowing under these leguminous crops.

Q. (By Mr. CLARKE.) Do you grow any tobacco in Connecticut?—A. I do not; I did for a good many years.

Q. You are familiar with the tobacco culture?—A. Yes, born right in it.

Q. Do you think some of the crops can be substituted for tobacco to advantage?—A. What do you mean by advantage?

Q. Well, would something else pay as well, all things considered?—A. Well, that depends on the man, what his taste is, what his training is. No, I think for the average planter of tobacco in the Connecticut Valley, it is probably the best crop he can get; probably the best money crop he can get. He has been educated to grow it, and it is about all he knows; and he can not learn, because it is what he has been brought up in.

Q. Well, all those farmers carry on some diversified agriculture?—A. Very many of them do, and have a cow or two. They have hay enough to feed their own animals. The most prosperous are those who have tobacco in connection with dairying and market gardening; but after all, most of the farmers that grow tobacco grow that as the one staple crop.

On the question of overproduction, there is no question. There is an overproduction of cotton. Possibly there would have been an overproduction of peaches if it had not been for the freeze. The high prices tempted too many to go into it, but the freeze balanced up things. There is an underproduction in most everything else in the South.

Q. (By Mr. C. J. HARRIS.) Would not the market for peaches be much greater if the freight were cheaper?—A. Probably; and yet freight that would make a nice profit to the carrier would not make enough difference in the price to affect the consumer scarcely one way or the other. I hardly think it would affect the consumption at all. What would affect the consumption would be a better and a more even distribution. There are markets which are overloaded, like Philadelphia, Chicago, and New York, while there are towns of 50,000 inhabitants that have not a crate. A better distribution would double the production and consumption, probably.

Q. (By Mr. CLARKE.) Is there not improvement from year to year in distribution?—A. Yes, moderately so. I have had no trouble myself; but there are a great many who have.

The question of diversification of agriculture—we touched on that. Certainly the only hope of agricultural salvation in the South is diversity of agriculture. That is the only hope. The things to be raised I have touched upon in part; hay for sale as a commercial crop in the State, to our own people. I will not talk about shipping any out until they have supplied their own market. Then corn and dairy products. There are thousands of dollars worth of dairy products brought into the South from the North, which probably can be produced a little cheaper at the North; but when you add the freight on them, the producer in the South can produce them as cheaply as the man at the North, with the freight added. It is done by artificial growth, instead of trusting to native pasturage.

Q. (By Mr. PHILLIPS.) What is the reason timothy, red top, and such rich grasses do not grow in the South?—A. The reason is that the long, hot summer seasons burn them out. I presume the time will come when we shall discover from some place in the world grasses that are adapted to that climate that will grow naturally all over that land. There is a grass which many of them have down there and do not like, because they say when it once gets in your land you can not get shut of it. It is Johnson grass, a species of sorghum, but cut early in its growth it will make excellent crops of hay, two or three in a year. I wish I could give you the name of a gentleman just below Augusta, on the Savannah River, who is making a splendid living on nothing but hay, Johnson grass, living on 100 acres of land and making a splendid living off those three crops a year, a profit of about \$7,000 annually.

Q. Does not have to replant it?—A. Does not have to replant it and has the best home market.

Q. (By Mr. CLARKE.) That is not true the whole year round?—A. Oh, yes, practically; but they object to it, because they can not get shut of it. It persists in staying in your land, but it also gives you a good bank account.

Q. (By Mr. C. J. HARRIS.) What do you say this grass looks like?—A. The name is Johnson grass. It is a coarse grass. Well, you know what we call water grass?

Q. Yes.—A. A coarse grass like that. I think its botanical name is *Sorghum halepense*.

Q. Would that grow on upland, or does it require river bottom?—A. It wants rather a moderate bottom land, I think. I should say on very dry lands it would not succeed.

Corn is grown in moderate quantity but not enough to supply the cities and towns and hardly enough to supply the plantations. Some planters, with the low price of cotton, have been raising corn to help them out.

Q. (By Mr. A. L. HARRIS.) If good cultivation is required in raising corn, what would be the success?—A. Doubling the crop. I have produced on an 80 acre tract 8,300 bushels at one crop.

Q. That is not bad.—A. That is about 40 bushels to the acre. I sold it at 70 cents a bushel to my neighbors who were selling 7 cent cotton.

Q. (By Mr. CLARKE.) Are there silos in the South?—A. Very few silos; they will come with dairying.

Q. (By Mr. FARQUHAR.) Evidently you do not raise all the product you consume in Georgia?—A. No. There is lots brought in; it ought all to be grown there.

Q. (By Mr. A. L. HARRIS.) You have no idea of the amount paid out for products grown outside?—A. No; but it is enormous. At every little town you see railroads unloading the product the whole year through.

Q. (By Mr. FARQUHAR.) Cotton pays for it?—A. Cotton pays for it, and yet the cotton lands could produce all these supplies, and they could be sold right there at home at a high price.

Q. You have been there 10 years; during the whole time that you have been acquainted with Georgia agriculture, has there been any persistent conscientious agitation of this diversification of crops, attempting to raise their own truck and their own corn, and other things that take Georgia money into other States? Has there been systematic and intelligent discussion of these questions among farmers, in the Grange, or in the newspapers?—A. Through the State agricultural societies; and it has been impressed upon the people by the agricultural department of the State. They have a commissioner of agriculture, and for 6 or 8 years that has been strongly impressed upon the people by the monthly bulletin or letter from the department of agriculture, which has been printed by most of the newspapers in the State; but it seems to need a practical demonstration to carry it right to the people. It is working. It is being done in sections of the State; a steady improvement all the time. No question about that.

Georgia is a wonderful State for grape growing, but not particularly fine for marketing, because, for some reason at present unknown to horticulturists, grapes shipped from the South at the time they mature in the summer, after being off the vine for a day or so, the berries drop from the bunch, and there are no perfect bunches of grapes. It seriously interferes with the marketing, but there is certainly a fine opportunity for growing grapes in the South for wine making. They grow grapes of high quality, rich in sugar, and make some of the finest wine made anywhere in America, and if the wine industry is of profit anywhere in America, it certainly can be made so there.

Fine tobacco is another industry. The southern part of the State can grow a very fine grade of tobacco, and it is being done in a moderate way, and is an industry that can be developed very largely there.

The production of nuts: We are importing a great many hundreds of thousands of dollars' worth of nuts from foreign countries. The pecan can be grown to advantage in many sections of the State; it is grown in a moderate way, and its extended planting is being agitated. I am growing chestnuts down there. I have taken some of the Japanese chestnuts, by taking our native American chestnuts and planting and grafting them. There are some [showing chestnuts] grown from the graft, and I have 10 acres of these started, and they are as sweet as our native American chestnuts, yet as large as horse chestnuts.

Q. (By Mr. KENNEDY.) These are the Japanese chestnuts?—A. Yes; they were grown in Georgia two years from the graft.

Q. (By Mr. PHILLIPS.) How large do these trees grow?—A. They do not grow as tall as our American variety here at the North; they are broad and spreading, and grow as large as an apple tree ordinarily. I was offered 40 cents a pound for these chestnuts in New York at wholesale at the time they were ripe.

Q. (By Mr. A. L. HARRIS.) How many pounds could you grow on an acre of the ordinary orchard?—A. I would have to estimate a little. I should judge from about 80 to 75 bushels to the acre. Of course that price is a fictitious price at the present time—a high price; but they would be worth on the market and you could sell a train load at 10 cents a pound.

Q. How many pounds in the bushel?—A. About 50; \$5 a bushel. They have never been troubled by the weevil, as are our native American chestnuts, so far. They have not been troubled with it, and the scientists are trying to find out why. I simply speak of that as one of the new industries. People want the product.

Q. (By Mr. PHILLIPS.) They have the same flavor?—A. Oh, yes. There are some large varieties grown in France and Spain which are woody, tasteless, and not good at all; they are used in making soups, stuffing turkeys etc.; but these are sweet like our little American chestnuts.

Q. (By Mr. A. L. HARRIS.) The possibilities of the South, if employed, would be wonderful?—A. I think so.

Q. (By Mr. PHILLIPS.) Do prunes grow there?—A. We can grow the prune plum there, but I doubt if we can compete with California, because it has such a wonderful climate for drying in the open air. But we are growing Japanese plums there with wonderful success, and they are furnishing a very fine product. The European plums, which we grow all over the United States, will not thrive in the South, but this race of plums from Japan will. They have a thicker skin, and they cover a season of three months, and they are better than the European plums in many ways. That is a new industry just springing up, and because of their tough skins they can be shipped all over the United States while in their green state, and they are far preferable to anything that can be produced in California.

Q. How do they compare with the ordinary plum in flavor?—A. Much the same, with the difference in variety.

Q. (By Representative GARDNER.) Does that thicker skin result in their withstanding the attacks of insects?—A. You find the insect stings on them, but rarely find a worm inside. I will give this as a scientific chap made the statement, who has studied them for the past two years. I find Japanese plums with from one to nine marks of the crescent the curculio makes—its sign is a little crescent cut in the skin. I have found from one to nine stings on Japanese plums, different specimens on the tree, and not a single worm in any of them, and have followed it up for a number of years. A Cornell University scientist, who studied the thing, claims that the skin is so thick and tough and grows so rapidly, it crushes the egg before it hatches.

Q. (By Mr. PHILLIPS.) Will these plums grow in a Northern climate? Can you grow them in Connecticut?—A. Oh, yes; all over the United States. It is a wonderful new race of fruit which has come to this country and is particularly suited to the South. You can grow it as cheaply as apples.

Q. (By Mr. A. L. HARRIS.) Are you troubled with black knot in the fruit business?—A. Black knot does not trouble that kind of plums; it troubles all the European plums and the English Morello cherries; and some other of that class.

Another line of industry which will thrive down there on account of cheap labor is nursery stock, which is sold, of course, and planted most largely through the North, and which is expensive to produce in the North on account of high-priced labor. Georgia can grow as fine a tree, peach, plum, pear, or apple, in one year as the nursery regions of the North can produce in two years. That is a decided advantage, and then, of course, being a younger tree, it is more thrifty looking, slicker, and more attractive to the customer.

Q. (By Representative GARDNER.) Due to your longer summer?—A. Yes.

Q. How do they thrive in the North?—A. It does not matter where a tree of a known variety is produced as to its harvest. Take the Baldwin apple or the Concord grape or the Bartlett pear—they are adapted to a wide region of country, and whether propagated in Florida, Virginia, New Jersey, or Canada, it will not make any difference in its transplanting into another section of the country.

Q. How about its ripening its fruit?—A. Now there is not anything in that at all, after the first year.

Q. You say trees grown in the South of a given variety thrive equally well in almost any part of the country?—A. Yes.

Q. Does the place where the stock is grown have any influence over the period at which it ripens its fruit when transplanted to another section of a different climate?—A. No; not if it is a standard variety that is known in that country. Now I name these varieties, the Baldwin apple, the Concord grape, and the Bartlett pear, which will thrive equally well all over the United States, no matter where they were born. If I were taking seedlings I would not dare to take a seedling which originated in Georgia and plant it in New Jersey or northern Vermont with any hope of success, because it is of Southern origin, and properly belongs to that climate.

Now as to this question of bringing from the South to the North or from the North to the South, there has a little error crept in there which people do not seem to quite understand. It takes trees a little while to accustom themselves to the habits of the country. I may take four peach pits from one common source, and I will plant two in Connecticut and two in Georgia. I will come here to Washington, just midway, and take the old Crawford peach, get buds from it and send two to Connecticut and two to Georgia, and propagate four Crawford peaches, two in Connecticut and two in Georgia. I will grow them there until 1 year old, and then take one from Connecticut to Georgia and one from Georgia to Connecticut. The first warm day that comes in Georgia—in January or the 1st of February, the tree that was propagated in Connecticut will begin to grow and throw out buds, while the one raised there in Georgia will lay perfectly dormant

and think to itself if it does not say, "You Yankee fool, you had better keep quiet." And finally one day the frost will come and get him, and the Georgia Cracker will say, "I told you so." About the middle of February, say, or the first of March, when conditions are ripe, that Georgia baby will begin to grow, and the Connecticut baby will grow again if not killed outright; and the next year the Yankee will not do as before, but will sprout at the same time and do the same as the Cracker.

Q. And ripen the fruit the same?—A. Yes. On the other hand in Connecticut, the one raised in Georgia will lie dormant until the middle of May, being distrustful and not thinking that the warm weather has come to stay, and let the Connecticut tree get a start; it will lay back six weeks the first year, but after the first year they will both start in April. They have gotten into the habits of the country in one year.

Now take plants which are annual like sweet corn: You get your seed from just as far north as you can, if you want them to ripen early, and you will get early sweet corn, and vegetables of all kinds; on the other hand, if you want them to drag along late, get your seed from the South; but after one year they will accustom themselves to the habits of the country.

Q. Would what you have said about the trees be equally true if, instead of sending the buds to both places from the latitude of Washington, the tree which was transplanted from Georgia to Connecticut had been first budded there from the Georgia tree, and the tree that went to Georgia had been first budded in Connecticut?—A. If they were the same varieties they would get into the habits of the country after the first year. There are habits of plants all over the country.

Another point: An apple tree in Virginia will come out in bloom and open up slowly, and develop slowly, and finally begin to drop its petals, but it will be a week in the process of blooming; the same variety in New Jersey will be about five days; the same variety in Connecticut will be about four days; the same variety up there with Dr. Hoskins in Vermont will be about two days. The season is short and they have to hustle.

On this production of nursery stock, we found one great difficulty down there, and that was excessive freight rates on nursery stock to the North. There were a number of wholesale nurseries started in Georgia on a large scale, but had to give it up because the freight rates were excessive; we could not compete with the North on account of the excessive freight rates on nursery stock. It costs me at one time 95 cents per hundred to send nursery stock to Virginia from Georgia, and the same to New Jersey.

Q. (By Mr. FARQUHAR.) Does it contain two elements, bulk and weight?—A. No, when it is tightly packed. It is bulky but it is also very heavy. There is no difficulty in getting the maximum weight into a car.

Q. How do you account for the discrimination, if it be a discrimination?—A. I do not think the railroad people, perhaps, have ever got it through their heads. I think their tariff on nursery stock was made for local business, and they have never revised it to through business; they did not seem to see that it was an industry that could be built up, because it was an entirely new business. We have been importing from France, during all the history of this country, all our stocks which plums and apricots have been grafted on, and we commenced in a small way in Georgia to grow plum stocks, which we found we could grow there. It was a new industry, but there was hardly a profit in it with the low prices until the so-called McKinley tariff bill put a charge upon stocks coming in from France, which made it a nice industry; but the revision in the Wilson bill knocked that out, and it has gone down; but there is a chance to maintain that in this country.

Q. It was not reincorporated into the Dingley bill?—A. No; I think not; but it had died out under the other, and has not got to going again. I know it was nicely started under the McKinley tariff. Of course there are the fruits of various kinds. Blackberries grow wonderfully. Then the business of canned fruits, evaporated fruits—Georgia can make better and higher quality canned fruit than California ever could.

Q. Do blackberries grow naturally—wild?—A. They grow wild in great abundance, and cultivated they are superb.

Question 40, "Effect of improved agricultural machinery on production and prices." Of course there is no question that where used it has increased the production and reduced the cost of production, and will result in the using of less land, more intensive cultivation, and better results.

Extension of foreign markets: I do not know much about that, only, of course, cotton is always going to be an export, and that will take care of itself; but the further exports are particularly in the lines of canned and evaporated fruits, and the ones, I think, of tobacco and other things, that will naturally develop them-

selves. I can see plainly there is plenty of chance in these things on account of the low cost of production.

Q. (By Mr. A. L. HARRIS.) Can you raise as good tobacco in Georgia as the Connecticut leaf tobacco?—A. Probably not for the purpose for which the Connecticut leaf is used, but they can grow a fine-flavored tobacco for the filler. The Connecticut leaf is only a wrapper, and you know some sections of Florida and Georgia, by using Cuban seed, are producing the so-called Havana tobacco, and while not as good as the Cuban, it is much better than much that is sold for that. They make a very fine cigar, indeed, with it as a filler and with the Connecticut or Sumatra leaf for a wrapper.

Q. (By Mr. CLARKE.) Do you think they can afford to grow it there if tobacco from Puerto Rico and Cuba is brought in free of duty?—A. Probably not; but I suppose that is another question. It is an agricultural question. As a farmer, it seems to me that the opening of all these different countries to free importation of their products means a clean cut to the farmers; they may not want it, but they will have to take their medicine. Our tobacco farmers are very much stirred up about it, and the farmers generally that I talk with say that they are willing to stand with the rest of the people but they do not believe in all cutting being on the farmers. If we have a tariff for one we should have a tariff for all. We are willing to stand equally with the rest of Americans. I am frank to say to you, as an American farmer, that I believe that in all our tariff laws in the past, with the exception of the McKinley tariff, the farmer got the wrong end of it, and he did not get a fair show. Regardless of all politics, and as an American farmer, I say that he has not had fair representation. It has been given to everybody else at the expense of the farmer. Under the McKinley law we had a more equal protection.

Q. (By Mr. FARQUHAR.) You mean they were careful about the manufacturer and the farmer was forgotten?—A. Yes; perhaps it was largely his own fault, in that he did not come to the front and look out for his own interests, but he was not organized and they did not pull together. We are willing to stand on a fair basis with the rest of them. If the rest of them are going to have protection, we want it; if you have free trade for the rest of them, we will have it, too.

On cost of production: It is rather a difficult question, but my superintendent has kept some account of the cost of corn production, and we can produce corn in Georgia at from 20 cents to 25 cents a bushel; he produced it one year at 17 cents and a fraction. Hay can be produced in my section of the country at from \$6 to \$8 a ton, and it is worth from \$15 to \$20 in the home market. Canned and evaporated fruits can be produced cheaper than anywhere else in America.

Dairy products: While it is not a dairy country, lacking the natural grasses, yet the dairy products that the State itself needs can be produced as cheaply as they can be brought in, counting cost of production and railroad freights.

Cost of production of fruits varies a great deal, from about \$15 an acre on a large scale to from \$25 to \$30 on a small scale. Peaches, which I have talked about the most, will average about 500 crates to the car; that is, 24-quart crates holding 6 4-quart baskets. It will cost to pick and pack and handle, including package, about 30 cents a crate; and the freight of \$265 to New York—higher to Boston and other New England points, and less to Baltimore, Washington, and Chicago—is about 50 cents per crate; and the cartage, commissions and all, make a crate cost in our Northern markets all the way from \$1 to \$1.25, and they sell all the way from 50 cents to \$3, according as they are put on the market; on the whole, a nice business profit if rightly handled.

Within the past 2 years we have copied after that section of Colorado which made itself famous by producing cantaloupes—the Rocky Ford district. We would only see them in different sections of the United States while the home product was in the market, but they were never transported to any extent any distance before Colorado proved that they could grow a fine melon and ship to the far East, covering a period of 2 months, August and September. So Georgia has attempted to follow along that line, and has found that with railroad facilities, refrigerator cars, etc., it can produce equally good melons with Colorado and get them 3 months earlier. So that is a new industry built up in the last 2 years and likely to grow, and very much appreciated by the consumers of the United States.

Q. (By Mr. PHILLIPS.) Do you know why the cantaloupes are better flavored in Canada than in this country?—A. I question whether it is a fact. They do grow in the vicinity of Montreal one special variety of melon that is very well grown. There is this to be said: The northernmost limit of the United States, or the American continent, that you can produce anything to any purity in the vegetable line the finer it is in quality.

Q. (By Representative GARDNER.) Is that so of any of the vegetables, or only those that carry a large proportion of sugar?—A. I think it is with any of the vegetables. The northernmost limit that they will grow to full maturity will cause them to be very rich and luscious.

Q. (By Mr. PHILLIPS.) They claim the Canadian melon is better.—A. They grow them very fine there; a few skilled growers do produce some very fine melons in the vicinity of Montreal.

Q. (By Mr. RATCHFORD.) With reference to the melons, you spoke of Rocky Ford, Colo. Is not the shipment of the melons into the far East made possible by some new devices of transportation?—A. The refrigerator car; that is all.

Q. Is there not still something new for the purpose of shipping these melons?—A. Nothing that I know of.

Q. Have you not known of the cold-air funnel?—A. I know of experimental work, but no practical or daily use of these things. They are being experimented with, but I think none of them are in regular use.

Q. You do not know whether the experiment is a success?—A. I do not think it is a commercial success yet. They are working along that line, and in a short time I believe we are going to do away with the heavy refrigerator car and save the hauling of tons of ice. I made an experiment a few years ago with one of these cars, but it was poorly handled at this end of the line and proved a failure. It was claimed the railroad parties did not handle it properly because they had an interest in having the refrigerator lines maintained.

Another point: These Rocky Ford melons got a fame on the market. They simply came from the town of Rocky Ford. It was a melon that had been grown in the East, the Nettie Gem, an old variety; but they grew it exceedingly well, and it took the name of Rocky Ford on the market. It is a small melon, about 6 inches longest diameter and 3½ to 4 inches cross diameter; an oblong melon; green flesh. There were a good many planted in Florida and Georgia in 1898, and more in 1899. To sail under the other fellow's colors, instead of standing up like men and sailing under the name of Georgia and Florida melons they printed their labels "finest melons, grown from Rocky Ford seed," "Rocky Ford" in large type and "seed" in very small type, so that it could hardly be seen, and giving the impression that they were Rocky Ford cantaloupe melons, and they went on the market under the Colorado name. I am no more honest than the rest of mankind, but I know it pays to be honest. So I went to work and grew my cantaloupe melons and labeled them "Finest Georgia melons, grown by the same fellow that grows Hale's peaches," and stuck the label on the end. It rather made me smile when I sold mine in the New York market at \$4 per crate of about 50 melons, while the so-called Rocky Ford sold at \$1.50 and \$2. Maybe mine were better, or the people liked the honesty of it. They missed the opportunity of sailing under their own colors and making a profit at the same time.

Q. (By Mr. CLARKE.) Suppose you had left off the words "Hale's peaches?"—A. I wanted to connect the two.

Q. Suppose you had left it off?—A. It might have made a difference, but we had no crop of peaches, and I wanted to let them know I was not dead. I labeled the baskets and the ends of the crates and the cars. We put this on the crate like this [indicating]—"Hale's peaches"—below, and when it is melons we put this melon label right above it this way [indicating]. Then we put a label in every basket of peaches, so that every consumer will know. I believe it is the business of the farmer to apply all legitimate business methods to his business, and if he does not I do not think he has any right to complain that every man's hand is against him and that there is no chance for the farmer.

As to the increase or decrease in transportation rates, there is a general improvement in transportation in the South. The two roads that I have come in contact with most, the Central of Georgia and the Southern, are paying very strict business attention to these new industries, and are more than willing to do anything they can within reason to foster them. I do not pretend to ask favors, because I do not believe in that, but I talk as one business man would with another—a partner—and they do everything in their power and give us excellent service. But when we go North and strike the Pennsylvania, and especially the New York, New Haven and Hartford, we are crowded excessively on the rate. On the car that costs \$265 to bring it the thousand miles from Fort Valley to New York, the New York, New Haven and Hartford puts \$90 on it to take it to Boston over night, and \$70 to take it to Hartford, 110 miles.

Q. You could not afford to send by boat?—A. No; it would take too long; they must go quickly. They give us passenger time, practically; not quite as much as that, but they give us 48 to 50 hours to New York, which is good time and good service, and they very rarely drop down on it.

The question of good roads, which is certainly one of very great importance, has not had very much attention paid to it in Georgia, but it is the poverty of the country. There is certainly great need of good roads there, as they are great civilizers and great aids to the handling of crops.

Q. Does rock abound?—A. No; there is very little rock of any kind in central Georgia, and gravel is not overabundant. It would be very costly making as fine roads as they are making in some sections of the United States.

As to combinations to control prices, there is very little of that, and there is very little opportunity for it in agricultural production; it is almost an impossibility. But there might be, as I have said, in distribution. There is need for it, not so much among the larger growers as among the smaller growers. To get the best service they must be able to load full cars promptly and ship promptly. The small grower is at a disadvantage. Such a combination would bring pressure to bear on the railroads, probably.

Q. (By Representative GARDNER.) Have you such combinations in the South?—A. They have had a combination of growers in the State of Georgia, where it has not accomplished very much. It only takes in a part of the growers. Many of them seem to lack the confidence in it, and it has not been of very great assistance to the growers, except to bring them together and get them acquainted; and whenever men come together it does them some good.

Q. Do you happen to know anything of the fruit growers' associations of New Jersey?—A. Not very intimately. I did know of the one you have at Hammonton at one time. Farmers, for one reason or another, do not seem to trust themselves enough to get together. They have a peach-growers' organization at Deckertown, Sussex County, that has marketed the crop to fairly good advantage. There is a general distrust among farmers of one another. Farming is such a good business that every man can live independently of everybody else on a farm; he becomes so independent that he leans over backwards. If farming were not so good a business they would have to unite and pull together.

Q. As a matter of fact the combinations suggested by you were of great benefit to the growers in that section of the country. They made railroad rates; they made arrangements with commission men; but it has happened in most of the cases that the membership were not satisfied with selling to a better advantage, but also determined to buy to a better advantage, and the associations have therefore been compelled to first go into the fertilizer business, and from that they got into general merchandise; and as associations they make money for the farmers, but as merchants the associations fail.—A. Every time. That has been the history of them the country over. In the first place, they made an attempt to help the farmer in the sale of his products, and made a fair success. They then attempted to buy his supplies, his fertilizers; have gone into the store business, and have been miserable failures everywhere. I do not know of one of these cooperative organizations that is a success anywhere in America.

This question No. 46, "Effect of so-called grain and cotton gambling"—that is too deep a question for me; only I think, in a general way, it is an injury to the producer—the grain and cotton speculations—making fictitious prices and prices on things that are not produced.

On this question of trusts—that is too big for me. I expect you will find it is too big for you before you get through with it. It is a great, big question, with some good sides to it and some bad ones; and how you are going to handle the bad ones without throttling the good ones I do not know.

Q. (By Mr. FARQUHAR.) Something like the parable of the tares and the wheat?—A. Yes. Possibly general publicity of their accounts, of their business, might come somewhere near it; but it must be uniform legislation. You must encourage all the States to have one uniform law. Whether you can do that through Congressional legislation I do not know. This thing of removing the tariff tax from all who become a monopoly might do some good and some harm; while doing some good to one it might do harm to others. I am a believer in American citizenship and individuality to that extent that I do not quite fear these trusts as permanent institutions for injury. When you take the personal element out of business you have taken the life and soul out of a great many organizations; and I would not wonder if these great big machines went to pieces of their own weight. The life of trade is the individual back of a good many small concerns, and you are not going forever to stifle that man. If he is going to be a live, living, working force, he is not going to be satisfied forever to take his dividends out of a trust and lose his identity. Trusts are a hindrance to trade, and I have a kind of notion they will some of them break their own backs. I do not want any stock in any of them; I would rather have it in a good farm, myself and I would rather loan money on a good American farm than on trust certificates.

Q. (By Mr. CLARKE.) You do not believe they can gain any permanent monopoly?—A. No; I do not think so. I somehow have a notion that there is somebody in America smart enough to do business in spite of them. Every remedy that seems good also cuts the other way.

On question 49, pure-food laws, etc., you want either national legislation or uniform State legislation.

On question 50, in relation to preventing the spreading of diseases among domestic animals, etc.—it is a very important question at the present time. The different States have been legislating about the San Jose scale, which the entomologists have got up an unnecessary scare about. It is a dangerous pest, but no more dangerous, to my mind, than some others we have had in the country. The different States have enacted various laws which are a very great hindrance to the trade of the nurseryman and a disadvantage to the small planter generally. There is before Congress now a bill, introduced, I think, by Representative Wadsworth, of New York, which puts that matter entirely in charge of the Secretary of Agriculture, and requires an inspection of all stock coming from foreign countries and the certificate of that Department. It also requires the inspection of all the nurseries in this country and the issuing of a certificate by him which will allow them to go into all the States. There should be a law of that kind. It seems necessary to have some regulation, because I do not think it is possible to compel uniform State legislation, and the present legislation in some of the States is a very serious hamper to agricultural industry. The law now before Congress is generally praised by the more intelligent horticulturists. The entomologists, some of them, would want it more strict, but it is a simple law, and would be quite inexpensive and probably serve the purpose. The main purpose of that is education more than anything else.

Q. About the education of the negro race in the South: it was testified to before us a few days ago by a very intelligent gentleman, who has had great opportunities for studying the subject, that in his opinion one-third of the negroes in the South have deteriorated since the civil war, one-third have remained stationary, and one-third have been improved. In your opinion, is that a correct diagnosis of the existing condition?—A. Well, I have known so much less of the South than probably this man has that I would not be qualified to make the statement. It is only within 20 years that I have known very much of these conditions, and only within 10 years that I have been doing business there and have come closely to understand it. I think around the large cities and towns perhaps the negro has deteriorated; he has come too close in contact with white folks, and if he has learned anything bad he has learned a good deal of it from bad whites. I can see, in 10 years of agricultural work in my section of Georgia, a very marked improvement in the negro—in his intelligence, in his general appearance, and in his efficiency in that section of Georgia—and we are right in the Black Belt, among the plantation darkies. Of course we are close to a little town of 2,500 inhabitants; but I can see a general improvement there. The old-time darky shows more politeness than the younger ones do. The old-time darky is very courteous to everybody; the present-day young darky is a good deal like us white folks.

Q. (By Mr. PHILLIPS.) Is that not partially to be accounted for in that section by the conditions of agricultural work?—A. Possibly so. Of course where there is new life and new ideas they are bound to absorb some of it.

Q. Are there quite a number from the North engaged in your business?—A. Some. The original plantations, however, were developed by native men there, and one of the largest places there is owned and managed by a native man. The majority of the orchards are owned by the natives there. There are a number of Northern people there—quite a number from Ohio—but these are mostly stock companies owned by a large number of people in Ohio, who come down there for a sort of picnic in the winter, and another picnic in the harvest season.

Q. Do you think they are improving in the cotton belt as rapidly as they are where they have diversified interests?—A. The negro is as simple almost as a child in his habits, and under the old plantation conditions he was closely under the care of his master and his family. He took care of them much in a general way as he did his own children, looked after them in their little ways, their sickness; cared for them; now, being turned loose by himself, he probably lacks some of the training, some of the care which was good for him in the old-time days, and, which he is lacking now, and which has helped deteriorate him to some extent.

Q. (By Mr. KENNEDY.) Here is a picture which compels me to ask a question: (Referring to picture described below.) What proportion of your labor is white, and what black?—A. Throughout the whole year, in the tillage of the plantation,

it is black; throughout the 2 or 3 months of harvest season it is two-thirds black and one-third white. That picture which you have of the interior of the packing shed shows 260 white young men and women from the best families of Georgia, South Carolina, and Alabama.

Q. That is native labor?—A. Native white labor; some of them came from the State University; some of them from schools—school-teachers; others from the smaller white schools and colleges of the State; but they are mostly a high class of well-bred Southern people.

Q. I should judge, if one could judge by this picture, that they are a very intelligent class of labor?—A. They are more intelligent laborers than we get at the North to do the same work.

Q. (By Mr. FARQUHAR.) I think you said that 90 per cent of the blacks there were engaged in agriculture?—A. Oh, no; I did not intend to. I thought I said that 90 per cent of the agricultural laborers were black.

Q. Do the white men of the South own small farms and go into agriculture as readily as the black man does?—A. Yes.

Q. More than half are black men?—A. I think about two-thirds.

Q. With one-third white, what are the occupations the remaining two-thirds get a living by?—A. Well, many of them get a living by small farming, but I did not include them as farmers; they are working for themselves. There are many small farmers working for themselves—working daily on their own lands in competition with this cheaper negro labor. Of course there are a great many others in mercantile business, in all professions, and all branches of work.

Q. Considering the cheapness of labor there—and the cheapness of it is the competitive element, of course, against this small farmer—are those whites able to support themselves in decency? Are they out of debt?—A. No, sir; the white man with a very small capital in the South, in agriculture, is seriously at a disadvantage. I have had this question come to me from white men all over the United States, in letters, from the West, about moving South—men who say they can scrape together \$500 or \$1,000, and would like to go down there and do farming—and they ask me what opportunity there is for their working out and earning some money when not engaged in their own work. I tell them that their opportunity is very limited, because they must put themselves in competition with 50 or 60 cent negro labor, which will work 12 or 14 hours a day.

Q. So the outlook really for the Southern white is not as good as it is for the black?—A. For the Southern white, of moderate intelligence and moderate capital, the poor white has not any better chance than the black man that I can see, and perhaps not as good.

Q. In agricultural labor do they work together—the whites and blacks?—A. Yes.

Q. Is there any class prejudice apparent?—A. Very little. Occasionally you will find it, but very little. Of course they do not come in contact very much on the same lines of work, but there is no general objection.

Q. Is it the tendency of the whites to go to the villages and smaller towns more than the black race?—A. No; I do not think any more so, because he can go to the town or village and starve, and he can stay on the farm and live.

Q. In the ordinary mechanical occupations down there—for instance, in the small carpenter work, and everything of that kind, in your smaller towns—does the white predominate?—A. No; I think the negro rather predominates in the small towns in that class of work; in bricklaying, carpentering, and blacksmithing.

Q. Do these blacks acquire any land at all, after they get through with the store liens and crop liens?—A. Yes. They are steadily getting small holdings, and building small houses of their own; but some of them work to save, acquire property, and some of them lose it after they get along a little while; but still there is a general gathering in of homes.

Q. Now, have you ever come in contact with any of these colored people that were educated in Hampton and Tuskegee?—A. Yes; we have had a number.

Q. What was your experience with them?—A. Well, it has been simply that they are satisfactory, and in some instances disappointing; but upon the whole they have been intelligent fellows, and I have had a number, especially from Tuskegee, of very bright young men, and they were there for knowledge. They came as tramp laborers, looking for a job, and we employed them, and in a little while we found them inquiring into this, that, and the other, and asking questions; and we found that they came there to get a practical knowledge of a well-managed fruit farm; they were there for the schooling itself rather than for the wages earned. I think Booker Washington is doing wonderful work in the South.

Q. You think it is worthy of encouragement, do you?—A. I think it is worthy of every encouragement they can have; but I believe Booker Washington is doing far more good than the Hampton school is.

(Testimony closed.)

WASHINGTON, D. C., February 14, 1900.

TESTIMONY OF MR. VICTOR I. SPEAR,*Farmer, Randolph, Vt.*

The commission met at 11 a. m., Vice-Chairman Phillips presiding. Mr. Victor I. Spear, farmer, was introduced as a witness, and, being duly sworn, testified as follows, the topical plan of inquiry on agriculture being followed:

Q. (By Mr. PHILLIPS.) What is your name, and where is your residence?—A. Victor I. Spear, Randolph, Vt.

Q. What is your occupation?—A. Farmer.

Q. Have you occupied any official position in regard to the agricultural industry, and if so, what?—A. During 8 years I have been a member of the board of agriculture, and 6 years was secretary and statistical secretary of the board.

Q. What is your position now?—A. No official position at the present time.

Q. We would be pleased to have you state any information you have in your own way.—A. There has been a gradual falling off in the number of persons employed on farms in Vermont during the past 50 years. The conditions of those now so employed are very much improved over former conditions; the day's labor buys more of the necessities of life than in former years. The effect of the introduction of machinery has been to require less men. It is not certain whether it has had any marked effect on the quality of this help. In the matter of quality, I mean intelligence and capability of the men employed. I do not think that average farm help to-day is more intelligent and more capable than they were in former years.

Q. (By Mr. CLARKE.) Do the sons of farmers hire out to their neighbors to the same extent that they did 40 or 50 years ago?—A. I am inclined to think not.

Q. But they do it considerably now, I suppose?—A. Considerably, a good deal now; but as far back as I can recall, I would say there is less of that class of labor than there was 30 or 35 years ago.

Q. Is there any more employment of Canadian French, who come in for the haying and harvesting season, than there was 35 or 40 years ago?—A. I do not think there is. The help that has come in for special seasons of late years has been more Norwegian help and Polanders, and that class, than Canadians.

Q. They come to reside, do they not, as a general thing?—A. Generally. They stay through the year, and in quite a good many cases they become landholders and make permanent homes.

The employment of labor on Vermont farms is quite constant. There is but little transient labor employed. The hours of labor on the farm average about 10; on dairy farms, where there are many chores to do, it would probably average 12 hours. Farm labor averages about 10 months employment per year; that is, a portion of it will be employed through the year, and the balance for 7 or 8 months, making, in my estimate, an average of about 10 months.

There is no marked tendency at the present time to seek employment in vocations other than agriculture. I mean by that that the great drift of people from the State and from the farm that has characterized the Eastern States, and Vermont with them, in the past, has largely passed away. I think the reason for that is that the opportunities in other lines of industry are not as great as they were 30 or 40 years ago, and that the condition of things is quite well established in Vermont at the present time.

Q. There is more tendency then for the young men who are reared on farms to follow farming as an occupation?—A. Yes.

Q. And to stay on the home farm or in the neighborhood than to go West?—A. I think there is a very decided improvement or change in that direction in the past 10 years.

Q. Do you not think that has been helped also by the very general introduction of agricultural machinery?—A. Yes; farming has become less drudgery and more of a business in consequence of improved machinery and improved methods, and there is a better understanding of what is necessary.

Q. Do you not think it will be further encouraged by the building of better roads, so as to make social opportunities on farms and also the business opportunities better than they are now?—A. Without any doubt, and I expect the building of our country roads and of electric roads through Vermont is going to be an important consideration in the next 20 years. That does away with much of the isolation of farm life.

In the matter of wages, there is no pay day agreed upon or practiced with farm help. Those employed usually contract for a specific time. They are paid money as it is needed, and the final settlement is made at the expiration of the contract.

The maximum price paid is about \$375 per year, with board and washing and room, and their living really. From this amount it falls to a very small sum, according to the ability of the laborer, some not being able to earn much besides their board and care, but I should say for fairly competent labor that \$150 would be a minimum price.

Q. Is this compensation almost always made in money?—A. Yes.

Q. There is no store-order system or anything of that kind prevalent on Vermont farms, is there?—A. Not to any extent. Labor is usually paid for in cash. Considerable work is exchanged by farmers during the busy season, during the season of corn harvesting. The filling of silos is usually done by exchange of help very largely through a neighborhood. Except at these times the matter of exchange of work is not very important.

There are but few farmers that provide tenant houses. On such as are supplied the rent is usually reckoned cash rent of \$2 to \$4 a month.

There is considerable renting of farms on shares, but the practice of renting for the fixed rental is on the increase. There is no regulation in regard to loans to tenants. Usually the tenant and the landlord are quite independent of each other.

Q. When farms are rented on shares about what are the usual terms?—A. The usual requirement in share renting is for the tenant to supply the labor necessary to conduct the business. The farmer supplies the farm and stock, and the tools and machinery; and outside expenses, like grain bills and necessary repairs, are shared equally between the tenant and the landlord; and then the income from the farm is divided equally.

Q. How about fertilizers and seeds?—A. Those are shared equally between the tenant and landlord.

The immigrants coming to Vermont as farm laborers are principally Canadians and Norwegians.

Q. (By Representative OTJEN.) Where do these Norwegians come from? Are they from abroad or some locality in this country?—A. They usually come from Sweden and Norway direct. They are secured through the immigration bureau at Boston or New York, or some port where they have their agents. A farmer sends there and orders his help, and they are shipped to him.

Q. Are any of them locating there permanently?—A. Yes. It is not uncommon for these men to work several years for a farmer, commencing at a low price, as they are strange to our language, to our customs, and are not very valuable the first year, and continuing in this service until they command better wages, and then, by becoming land owners, they settle there as permanent residents.

Q. They make good help, do they?—A. Very good help.

Q. (By Mr. CLARKE.) Good citizens?—A. Good citizens.

Q. (By Mr. FARQUHAR.) How long is it since the Norwegian immigrants came into Vermont?—A. Well, I should say about 10 years since they commenced to come that way. There has been more of it in the past 4 or 5 years.

Q. Do they come in sufficient numbers to colonize, in a measure, or are they isolated?—A. They are isolated. They come there now altogether through the application of farmers to these agencies for farm help in the spring time, and they will come several in a town, usually. Farmers will get together, perhaps a half dozen neighbors, or three or four, and correspond with the agency and get these men sent to them; but there is no colonization, no disposition among these men to colonize, so far as I have noticed.

Q. What proportion of those immigrants have families?—A. Not very many. They are mostly young men when they come here, and some of them have families that follow later.

Q. How are they divided as to sex?—A. Well, in Vermont, more men than women come.

Q. But there are quite a number of domestics in the Scandinavians?—A. Yes. They are getting Scandinavian help in the house more than formerly. They are pretty well liked as help.

Q. Do they show any desire to migrate farther West where Norwegian and Scandinavian colonies are, or are they satisfied with the conditions where they are?—A. Usually they have been pretty well satisfied with the conditions as they found them. Occasionally they will move off, but they have been pretty steady help, so far as I have noticed.

Q. What advantages are held out to these people to acquire land; that is, the prices of land, or rentals?—A. The price of farm lands in Vermont in many localities is very low, and these people are not particular about their social advantages and the other considerations that would influence the Vermonter—the American—and they sacrifice those and take some of the remote farms that

are several miles, perhaps, from school or post-office or railroad, and those farms are obtained for a very small price.

Q. Have you any means of knowing whether the conditions and advantages in Vermont are about equal to those in the West, say in Minnesota, the Dakotas, and elsewhere?—A. I am inclined to think that they are better.

Q. In the Eastern States?—A. Yes.

Q. (By Mr. CLARKE.) Particularly in Vermont, which is more fertile than some other States?—A. This does not, perhaps, apply to Vermont particularly, but I would say that from a recent trip through the West, with an eye open to this condition of things and the prices of land in that section, I am fully satisfied that there is no farm land as productive and cheap as the lands that can be bought in the East, and particularly in Vermont.

Q. (By Mr. PHILLIPS.) You speak of young men coming chiefly as farm help. Now, do these young men marry American girls, or those of their own nationality, as a rule?—A. I do not know as I could give the rule. I have seen it both ways, and for the State I should not know where to put it. I am inclined to think that more of them marry their own nationality.

Q. Then you have spoken of the Poles. Now, would you care to make a comparison between the nationalities as to efficiency in the help on the farm?—A. My judgment is that the Swedes and Norwegians, as a class, are the best help that we have to-day. Poles have been very satisfactory, too; and in the past 3 or 4 years they have been on the increase, but they are not quite as desirable a class of people as the Norwegians and Swedes.

Q. (By Mr. CLARKE.) Do you know about the relative proportions of the foreign element and the native element in Vermont at the present time, in farm districts?—A. I think the native help is several times more than foreign help. I should not know just where to place the proportion.

In regard to illiteracy of these immigrants: Quite a good many of them are unable to read and write; a good many more than there would be of our native people.

Q. (By Mr. PHILLIPS.) That is, to read and write their own language?—A. Yes.

Q. (By Mr. FARQUHAR.) How many Poles do you have there in your section as farmers, or on farm lands?—A. Well, I can not tell for the State how many there are, but I know they bring in quite a good many invoices of them every spring. I find them scattered around.

Q. Are they usually of the farm laboring class of Europe, those Poles, or just simply laborers that adopt farming?—A. I have an idea they are from the farms in their own country.

There is no marked tendency to colonize, to preserve foreign customs, with our farm laborers, and I am unable to note any marked influence on our agriculture by reason of this immigration.

There is no colored labor of any importance.

The school age of children is from 5 to 18 years.

The present system of education provides for the education of all children, and it is fairly sufficient for the people. They ought to have it a good deal better, and hope it will be, but every pupil in the State is provided for at public expense if they can reach our schools.

The curriculum of our public schools is not arranged with any particular reference to agriculture, or to any other branch of business. Our technical agricultural education is supplied at our agricultural college and experiment station. That is all of the agricultural education that we have provided for.

Q. How thorough is that education at your agricultural college and experiment station?—A. Well, it is a very thorough course, and they have a special course that has been in operation for the last 4 or 5 years, known as a dairy school, that runs 1 month or 6 weeks each winter, and gives special instruction in the matter of dairy work, handling of milk, making butter, and testing of milk. It has been technical education in the line of dairying. Their agricultural college proper is slowly gaining in students and in effectiveness, and, I think, in popular favor, and is regarded with good favor, I think, by the people of the State as a rule to-day.

Q. Have you any farmers' institutes in Vermont?—A. Yes; we have a good system of farmers' institutes, covering 3 months of each winter. From 30 to 40 farmers' meetings are held in different localities and special instruction is given in various lines.

Q. Has your State board of agriculture any official contract with these farmers' institutes, or with the agricultural college?—A. No contract with the agricultural college, but the board of agriculture has full control of the institute work. It is all managed under their direction.

Q. (By Mr. CLARKE.) Is there a State grange in Vermont, or local granges?—
A. Yes.

Q. Do they discuss agricultural topics, practical agriculture, considerably?—A. Well, to some extent. The grange, so far as I know it, and I am a member of the order, is more of a social business organization than it is strictly educational. The farmers' institutes are held very largely under the auspices of the grange. They help to get out items of interest to the farmers.

Q. Is there a Vermont Dairymen's Association?—A. Yes.

Q. And that holds meetings?—A. Once a year it has an annual meeting, about a 10 days' session. It has a very large exhibit of dairy products, and has as good talent as can be secured anywhere for instruction in dairy matters.

Q. Is there a Vermont Merino Sheep Breeders' Association?—A. There is.

Q. And they give special attention to all points of interest and instruction concerning that industry?—A. Yes; nearly every branch of industry has its organization in Vermont.

Q. Is there a Horse Breeders' Association?—A. There is—Bee Keepers' Association; Poultrymen's Association; Maple Sugar Association.

Q. Members of those associations usually study the subjects profoundly, do they not, and expound their views at their meetings?—A. Yes; and they ordinarily bring together findings of the particular class of work that they are engaged in and get the best talent that is to be secured for instruction; and we have, in addition to that, in agricultural lines, a system of State fairs that covers the State—probably 15 or 20, I do not remember the exact number—and a State fair; and most of the counties and localities have their fairs.

Q. Is scientific agriculture studied in these associations a good deal—the matter of the particular selection of breeds and of food crops, forage crops, and fertilizers, chemical analyses, and all that?—A. Perhaps it would not cover all of that. Each association studies with great care the questions that concern their particular line of business. The horse breeders, for example, would make a very thorough investigation and study of the matter of breeding horses and their care. The same would apply to the dairymen, and they would not only take the dairy but would take the product of the dairy; and these organizations may all be considered as lines of specialty in the work that they have taken up.

Q. Are you at present manager of the Vermont Maple Sugar Association?—A. I am.

Q. Give us a little description of that industry, the extent of it, and the season of it, and markets for the products.—A. The maple-sugar industry of Vermont is of considerable proportions. Out of 50,000,000 pounds that is produced in the United States, our census reports 15,000,000 to Vermont. It is an industry that means an income to the Vermont farmers of from \$1,000,000 to \$1,500,000 a year, according to the year.

Maple sugar is produced, as I suppose all here know, from the sap of the maple tree, and in the months of March and April the peculiar conditions of the Vermont climate make it possible to get a very fine product of maple sugar through the time of making it. The nights are cold and days are crisp, and this peculiar weather is a necessity to fine goods. The maple-sugar industry has undergone great changes in the past 40 or 50 years, and to-day it is made with as much exactness and with as much skill as is employed in the production of any article of commerce that I can call to mind. It used to be boiled out of doors, in the woods, in a caldron kettle, where everything could get mixed with the sap—the charcoal and leaves of the forest—and make a dark, rather strong preparation, that we would hardly recognize as maple sugar to-day. With our best operators the maple sugar is handled with as much care as the milk from a dairy cow from the time that it is drawn until it is put on the market as butter. Maple sap is almost as susceptible to contamination as milk is, and the finest goods can not be made without great care. From this I mean that this sap must be gathered immediately after it has come from the trees and must be evaporated immediately, and put into condition for market. If any length of time is allowed, if it is exposed to the air, it loses its delicate fine flavor and loses its light, bright color.

Q. Of what materials are buckets and evaporators composed?—A. The buckets are metal, usually, to-day.

Q. That is, tin plate?—A. Tin. A great many use wooden buckets. They are equally good if they are well painted. The evaporators used are made of tin, and our gathering tanks are made of galvanized iron very largely, and the sap is strained every time that it is touched, from the time it is taken from the buckets until it is put up in cans for market, excluding every outside influence.

Q. Is the evaporating done in sugarhouses or out of doors?—A. It is done in sugarhouses, protected from any bad conditions of the weather or storms.

Q. Are the evaporators arranged with compartments, so that the sap enters at one end and comes out sirup at the other end?—A. Yes. The time that sap should be in the evaporator from the time it enters until it comes out in sirup is about 10 to 15 minutes; it takes about that time for the sap to flow from one end of the evaporator to the other; and it should be boiled rapidly enough so by the time it reaches the back side of the evaporator it should be drawn as sirup.

Q. Then what is done with the sirup?—A. The sirup is put into cans, sealed tightly to exclude the air, and put upon the market in that condition.

Q. Is all of it treated that way?—A. A great deal of it is cooked into sugar. The sugar is put up in cakes or in wooden or tin pails, and the sugar that has not been sent to special customers has largely gone to the big sirup houses of the West and East, to be mixed with glucose and cane sugar for the use of the general public.

Q. (By Mr. PHILLIPS.) And sold as— A. (Interrupting.) Vermont maple sirup.

Q. Now, is there much of that done in Vermont? Is there much mixing and adulteration?—A. I do not know of any mixing in Vermont. We have a very strict law against doing it, and if a person was suspected of it or known to do it he would be prosecuted in 15 minutes.

Q. Well, in quantity, is there more sold as sirup or as sugar?—A. About 9 pounds is sold as sugar to 1 sold as sirup.

Q. Now, the census report of which you speak, showing the production to be so many pounds. Did that include sirup and sugar both?—A. Yes; reduced to pounds as sugar.

Q. (By Mr. FARQUHAR.) What is the extent of the sugar maple in the State of Vermont?—A. It covers the entire State, practically.

Q. Is your sugar making all over the State of Vermont?—A. Yes.

Q. Does it extend to any other State near by you?—A. Yes. New York produces the second largest amount of maple sugar. Ohio produces about 6,000,000 pounds. New Hampshire produces some. In fact, I think some 22 or 25 States produce more or less maple sugar.

Q. Do you plant sugar groves for the purpose of producing sap from the trees, or are they natives?—A. They are natives.

Q. You have not yet got to planting new orchards?—A. Not to any extent. It has been done in a few sections, and ought to be done more. A great many have been planted by the roadside. Those serve a double purpose—for shade and for sugar purposes.

Q. (By Mr. PHILLIPS.) In the planting of sugar orchards how long is it before they mature sufficiently to be utilized?—A. Well, 35 to 40 years. They would not be large trees then, but they could be used to some extent.

Q. (By Mr. FARQUHAR.) How much revenue could be brought from an acre of sugar maple, or have you any figures in respect to the product that would give a relative idea of the difference between the profitableness of sugar maple and any other crops?—A. The average product of a maple tree in sugar is about 3 pounds a year, varying from 1 pound to 5 or 6; 3 is a fair average. And on an acre it would not be advisable to have more than 30 or 40 trees. Thirty trees would be plenty. When they get to be 50 years old you could figure that an acre of land that is well devoted to sugar maples should produce in the vicinity of 100 pounds of sugar a year.

Q. (By Mr. PHILLIPS.) And about what is the average price of that?—A. That is a hard matter to determine. It varies from 5 cents a pound to 15, according to the skill with which it is made and the skill in marketing. Maple sugar is quite varied in its character and its appearance. I have spoken of the better methods of making. We still have a large amount of sugar that is made carelessly. It is exposed to bad atmospheric conditions; it is made with poor utensils, and it produces a black and rather an unsightly product for market. We have from that up through to our fine product, which we are very proud of. These coarse goods—the dark, unmarketable goods—are the ones that are sold at 5 or 6 cents a pound in ordinary years, and go to the sirup houses. Too large a proportion of the sugar made to-day is of that quality.

Q. Are there many farms given up solely to the product of sugar?—A. Not any; it is a side issue. The sugar season only lasts about 3 to 6 weeks, and it is really to Vermont farmers as important as any line of industry that they are engaged in, with the exception of dairying. The income of the Vermont farmer from the sugar works is practically so much added revenue. He does not have to pay out \$ a dollar for materials to operate with; his wood is on his farm, and it comes at a season when there is not very much else he can do that will bring a cash return; so, for that reason, it becomes very important and more of an object to the Vermont farmer than the amount of revenue received would indicate at first.

In the production of our butter we pay out so much money for Western grain that sometimes we do not know whether the mill or the commission house returns are the largest.

Q. (By Mr. CLARKE.) Sugar making is usually regarded as a very pleasant occupation for the season that it lasts, is it not, and much enjoyed socially by the people?—A. Yes; it is a season of considerable social interest. Every sugar camp, nearly, has its sugar parties. Young people and old meet there for a little visiting, eating new sugar. There is a little interest in it.

Q. (By Representative LORIMER.) Are the maple groves used for pasturage?—A. To quite an extent. A great many are in the pasture; some are in the forests. The growth of maple trees on land does not prevent the production of considerable feed for stock.

The matter of taxation of agricultural property—I will simply say that all the property of the agriculturist is taxed where they can find it. There is no particular suggestion I have to make in this connection.

Q. (By Mr. FARQUHAR.) Is there any complaint among the farmers of Vermont that they are taxed more than other classes?—A. Oh, yes; it would be unnatural if every class did not complain on taxation.

Q. Are these things discussed at your institute or your meetings of farmers?—A. They are. There has been a great deal of discussion for the past 10 years in Vermont; a great deal of dissatisfaction—nobody has solved the question for them, the Vermont farmers especially—over the taxation of the mortgage and the real estate both. They call it up there a system of double taxation, and they are trying to find out a way to avoid it; but we have not got out of it yet. That method of taxation brings a very great burden upon the farmers, and especially the farmers that are in debt for their holdings.

The prices of agricultural products: This is mainly due to the development of the Western country and the largely increased and cheapened production. The decline in the value of farm lands has followed as a natural result of the cause above stated. The productions of the farms have become so cheap that in some cases it has not been profitable to operate them.

Q. (By Mr. CLARKE.) What are the nearest large markets for Vermont farm products?—A. The main market for Vermont farm products is Boston.

Q. Do you know how railroad rates compare between Vermont and Boston and Iowa and Boston?—A. I can not tell you definitely. I think they are somewhat less, but not very much.

The decline of value of farm lands has followed as a result of this development of the West, and I am of the opinion that the value has gone so low at the present time that the cheapest lands in the country are here in the East, have gotten below their normal value as compared with these Western lands.

Q. About what is the average per acre of Vermont farm lands at the present time?—A. That would be a very hard question to answer, because the value varies so much. The value of our farm lands would range from \$5 an acre up to \$50. Fifty dollars would be about the limit for our best farms.

Q. What would be the price of good meadow farms near some of the large towns, say in the Otter Creek Valley, Lake Champlain Valley, and Winoski Valley, in the neighborhood of Richmond?—A. Probably \$30 or \$40 an acre.

Q. Can you buy some of those farms for \$200 an acre?—A. I have a farm for sale, 3 or 4 miles from St. Albans, formerly owned by J. A. Bedard. That was put in my hands a short time ago to sell at \$30 an acre.

Mr. CLARKE. I personally know of farms near Richmond which probably can not be bought for \$200 an acre.

The WITNESS. Undoubtedly there are such farms, but it might be a question if a man could get \$200 an acre if he wanted to sell it.

Q. (By Mr. PHILLIPS.) Will you state about what farms were usually worth 30 or 40 years ago?—A. I can not state that.

Q. Would you suppose there has been a decline of a third or one-half in Vermont, on the average, in the last 25 years, in farm land?—A. Yes; one-half.

Q. A decline of about one-half?—A. I think so.

Q. (By Mr. FARQUHAR.) What is the character of your \$5 farms?—A. Those are usually some distance from town and from school, and have social disadvantages. Some of them are rather rough and not very well adapted to the use of farm machinery, and a great many of them are quite fertile and productive farms. In fact, I know of farms that can be bought for \$5 an acre which, from the simple matter of production, would rate very high; but it is their situation and the fact that they have not been smoothed up and adapted to the use of farm machinery which has come into use in the last 20 years.

Q. (By Mr. PHILLIPS.) Somewhat away from railroads and markets, I suppose?—A. Yes; that has had a great influence.

As to increase in acreage, I would say that the acreage in Vermont has been on the decrease. There are not as many acres tilled to-day as there were 40 years ago. A great many of those farms that were located some distance from town and school are used to-day as pastures; they are used in connection with the farm where the home was more favorably located. Some of them are being devoted principally to the growth of timber, but the acres tilled have declined to quite an extent. There is no bonanza farming in Vermont properly so-called. We have quite a good many stock farms, wealthy men that have come there for the purpose of developing some line of farm animals; but the bonanza farm as it is known in the West does not exist in Vermont.

The matter of production: Vermont produces a surplus of nearly all agricultural products except grain. The low cost of grains in the Western States has led to buying instead of raising wheat, corn, and oats.

Q. (By Mr. FARQUHAR.) Do you find it cheaper to buy the Western corn than to raise it? Does it come to that analysis at last.—A. There is a difference of opinion among us. I think it is cheaper to raise it. It depends a good deal on a man's situation. The same rule will not hold for every farmer and under all conditions; but I am inclined to think that our farmers are coming to the belief that it is better to till more and to raise more themselves and buy a little less. There is no State, as I contend and believe, that can produce corn any more cheaply than Vermont can in our best localities to-day. I believe the cheap lands that we have there and the present methods of cultivation and tillage make the cost of a bushel of corn but little more in Vermont than it is in Iowa, and we can not afford to freight it from Iowa and pay for it besides.

Q. (By Mr. CLARKE.) Do you think that is equally true of oats and barley?—A. No; it would be about true of barley. The raising of oats—there have been peculiar conditions in the past 10 years attending that crop that have made it very unsatisfactory. I do not know but some element of the soil has been removed that is necessary in perfecting the oat crop; the oat crop has not been very profitable as a rule.

Q. Is Vermont a good potato State?—A. Very good potato State. We do not go into the commercial potatoes to a very great extent. We have had so many difficulties—rust, potato bugs, and one difficulty and another—that farmers have largely cultivated what they have needed for their own use, though in the western portion of the State there is quite a territory that sends potatoes to the market.

Q. (By Mr. FARQUHAR.) Are you planting the same class of potatoes, same varieties of potatoes, that you planted 20 years ago?—A. No; they change.

Q. How much variety do you make in the usual table potatoes?—A. Well, I saw at one of our fairs a year or two ago 170 kinds that one man was producing. We have every kind of potato that is produced on the market in different sections.

The matter of transportation cost has been reduced in the past 40 years over the railroads. The cost of transportation from the farm to the market has been reduced largely by improving the highways—capable of very much more being done in that direction.

There is no effort in Vermont to control prices by means of combinations, and we have no futures that are selling there.

As to the Federal pure-food law. In Vermont, among all the farmers and producers, there is no matter of legislation that we regard with as much solicitude and interest as we do the matter of Congress passing some measure that shall be effective for giving a pure food to the people of this country. We consider that it is just as much a counterfeit to put a label of Vermont butter or Vermont maple sugar upon a combination of glucose and sugar or lard and something else as it is to stamp a piece of paper with the die of the Treasury and call it money. It is a counterfeit, it is an imposition, and legitimate industry has to pay all the bills. The consumer does not get very much benefit from it. He pays pretty nearly the price of pure goods. The man that puts up these substitutes is the one that gets the benefit, and the producer of honest goods—the original producer—is the man that has to suffer the consequences. We see this very plainly in our product of maple sugar. The maple sirup that is found in all the markets of this country is a combination of about 20 per cent of our poorest grade of maple sugar with glucose and some of the better grades of cane sugar. Now, every gallon of that stuff that comes onto the market is in competition with the maker of maple sugar that is putting up an honest product and something that is a luxury to anyone that uses it. It not only lowers the price of these goods, but it

discredits the product with the consumer. The consumer who has used this glucose and small per cent of maple sugar for flavoring becomes dissatisfied with it and ceases to be a customer for maple sugar, because, he says, he has used Vermont maple sugar and he does not like it. We do not know just how this thing is going to be done, but it does seem to us that it is not unreasonable and it is not beyond the possibilities and the reasonable requirements of legislation to ask the sugar manufacturers to put upon every package that they send out of goods that is going into consumption as human food a statement as to its purity or to its being adulterated. There is no reason that I know of why a person should not be able to buy a mixture of maple sugar and glucose and use it on his table, but the objection is in the man selling it to him for a pure article at a low price and injuring industry and disgusting the consumer.

Q. (By Mr. PHILLIPS.) Is not the flavoring sometimes done chemically and perhaps with chemical preparations that may be injurious to health?—A. I do not know to what extent there is any danger to the public health in that matter. I do know that every villainous compound, pretty nearly, that could be imagined goes onto the market. The distillation of corncobs is used to quite an extent; hickory bark, and all these things they put into the mixture to give a little bit of a tang to it, that they tell people is maple. Now, I hope your commission, in the prosecution of this matter, will make some recommendations in the matter of securing a pure-food law that shall be a protection to producers and consumers if you do not think it is unreasonable; and we believe there is nothing that will do more for legitimate industry than this will do.

There is one other topic here that I will just touch upon—the law for the prevention of the spread of contagious diseases. In my official relations with the board of agriculture I had charge of the cattle commission during 4 years. Vermont has a very effective law in the matter of controlling the spread of contagious diseases among its cattle. I am inclined to think that Vermont has taken an advanced ground in that matter over any of our States. We have dealt quite extensively with the matter of tuberculosis during the past 4 or 5 years, and we feel as though we had that matter to-day under pretty good control. No animals for breeding purposes, or to be kept on our farms, are allowed to come into the State without having passed the test with the use of tuberculin, that finds them to be free from tuberculosis. We thoroughly believe that this is one of the most insidious contagious diseases, one of the most dangerous to the dairy industry, of any we have had to meet; more dangerous than some others, because it goes along for a good while before we discover what it is doing.

Q. Are there many authenticated cases where human beings have caught tuberculosis from the use of milk?—A. There have been several cases that have come up in our work, where the evidence was very convincing to me, and I think would be about sufficient to condemn a man to be hung, but I do not know whether it would be sufficient to condemn the cow or not. There have been several cases where we have found very bad herds, and we have found some member in the family that was suffering with tuberculosis, without any taint from any other source that could be discovered, where they had been large users of milk. I consider that it is possible to communicate it from the animal to the human. I do not think it is very common.

Q. Sometimes, even in the case of children, has it not been discovered, or have you any such cases?—A. We find them in that way. I could not say to you that I know that they come from that source; but we find them closely associated.

Q. (By Mr. FARQUHAR.) Probably they are simply coincident. You have no medical authority to show that the contagious disease was brought or contracted to that family?—A. We have a great many medical men that have cases the same as we have, where they traced so close that they can not account for it in any other way. But men are not disposed to be experimented on, to have the germs injected into them for the purpose of finding out whether it kills them or not. We have not any of that class of experiments; but we have a good many cases where the disease in the herd and family have come along so closely together that they seemed to be due to cause and effect.

Q. In the case of a herd being attacked with tuberculosis, what authority have you in Vermont for the destruction of the herd?—A. Whenever a farmer applies to the commission for a test of his herd the commission makes the test and they destroy all animals that are found to be tuberculous and pay the owner one-half the price or a fair valuation for the animals that they destroy.

Q. Does this come from the State treasury—this amount that is paid to the farmer?—A. Yes.

Q. (By Mr. CLARKE.) Do many farmers apply to have their herds tested?—A. Yes; over 80 per cent of the cattle of Vermont have been tested.

Q. If the farmer knew that his herd was infected with tuberculosis so that he would have to sustain a loss of one-half in value, would he be likely to apply?—A. Yes; those are the very men that do apply. If he does not apply he is liable to have the whole loss to bear.

Q. Would he not send them to some other State, perhaps, and sell them for nearly their full value?—A. Well, possibly, but other States are not looking for peril. They have their bars up. There is no place, only New York, that you can send them to.

Q. (By Mr. PHILLIPS.) He would be more likely to sell them within his own State if he were disposed to sell them, would he not?—A. Well, I am glad to say to the credit of the Vermont farmers that we have not seen much of that disposition. They regret, of course, to lose that part of their herd, but they recognize that it is a liberal proposition on the part of the State, and it is designed to help them out of a difficulty that perhaps they are not to blame for being in, and they have accepted it usually in that spirit.

Q. (By Mr. CLARKE.) What is the condition of the sheep industry in Vermont at the present time compared with what it was 30 or 40 years ago?—A. It is probably not over one-fourth as much at the present time as 40 years ago.

Q. Was there a large slaughter of sheep in Vermont during the free-wool tariff period?—A. There was. The flocks were very largely sacrificed during that period.

Q. Since the duty has been restored upon wool, has there been an increase in the flocks?—A. Something of an increase. The prices of wool for the past 2 years have been such as to encourage sheep growing to quite a considerable extent.

Q. Are not nearly all the farms in the State adapted to sheep industry?—A. They are, and better than to any other industry that has ever been practiced by our farmers.

Q. Would they not be greatly improved by the pasturage of large flocks?—A. Sheep, as a rule, are preservers of pastures, and if our sheep industry had remained to us we would not have the \$5-an-acre farms that I have mentioned to such an extent as we have to-day. Many of these farms that were well adapted to sheep husbandry were not adapted to dairying; the pastures were too remote, and, as a consequence of leaving the sheep industry, there was no good use to put these farms to.

Q. Has the breeding of Merinos in Vermont been a considerable industry; breeding, I mean, for markets outside of the State?—A. It has been a great industry in the past and it is of some importance to-day.

Q. Where are these sheep marketed at the present time?—A. Most of them are marketed to-day in Australia and southern Africa; that is, before the Boers got dangerous down there they used to be.

Q. Do buyers from these countries come to Vermont and select their sheep?—A. I would add that the markets at the present time of South America are quite good in the Argentine Republic. Yes; buyers have come from these countries to a certain extent, but more of the stock has gone out in charge of Vermonters, who have explored with their stock and looked up their customers.

Q. From about what period does this Merino industry in Vermont date?—A. When was it first undertaken?

Q. Yes.—A. About 75 years ago.

Q. Say about 1810?—A. Yes, perhaps it is as far back as that.

Q. Consul William Jarvis, of Weathersfield, Vt., who was United States consul to Portugal or Spain, was the first, was he not, to introduce Merino sheep into Vermont?—A. I do not know; but Mr. Atwood took them to Connecticut earlier.

Q. Has there been a very great improvement in the Merino sheep, by the culture that has been practiced in Vermont?—A. Very great, indeed.

Q. Do you know whether the sheep imported by Mr. Jarvis had wool growing all over the body or not?—A. It had not. The legs were comparatively bare, and the head was comparatively bare. There were but very few wrinkles. The wool was not very heavy, but was all of nice quality and fine. The farmer from that time developed the American Merino of to-day.

Q. How many pounds of unwashed wool does a Merino ram, of Vermont, to-day shear?—A. Well, that varies. We have had records up to 40 pounds, but the Merino ram that shears 20 to 25 pounds is considered a good ram.

Q. What was the maximum of those imported by Consul Jarvis?—A. I think about 10 or 12 pounds.

Q. Do you know the number of fibers per square inch on the sheep that he imported and on the sheep of to-day?—A. I haven't it in my mind at this minute.

Q. Was it, say, about 42,000 fibers to the square inch in 1812 and about 248,000 fibers now?—A. I presume in about that proportion.

Q. Do you think of any legislation, either national or State, that would help any one of the industries in Vermont?—A. We feel as though a Federal pure-food law would be of great interest and of great benefit to the agriculture of Vermont, more so than any other matter that comes to mind. The present condition of the tariff legislation is pretty fairly satisfactory, as far as I know. I think under it Vermont can get back, in a degree, to its former position as a sheep-growing State. (Testimony closed.)

WASHINGTON, D. C., February 14, 1900.

TESTIMONY OF MR. HOMER W. VAIL,

Farmer, North Pomfret, Vt.

The commission met at 11 a. m., Vice-Chairman Phillips presiding. At 12.27 Mr. Phillips introduced the witness, Mr. Homer W. Vail, who, being duly sworn, testified as follows, the topical plan of inquiry on agriculture being followed:

Q. (By Mr. CLARKE.) Please give the commission your name, residence, and occupation.—A. Homer W. Vail, North Pomfret, Vt.; my occupation, a farmer.

Q. Have you given particular attention to the subject of dairying?—A. I have been compelled to do that, somewhat; I am a dairyman myself.

Q. Are you president of the Vermont Dairymen's Association?—A. I am not. I am not an officer at all now of that institution. I have been an officer. I have been the treasurer of the Vermont Dairymen's Association for something like 16 years.

Q. And have attended most of its meetings?—A. I think I have attended all the meetings, with one exception, when I was West at the time.

Q. I would like to have you give the commission, in your own way, or in any order that you prefer, a general knowledge of the subject of dairying in Vermont, its progress and development, the introduction of high-blooded cattle, and the improved methods in the production of dairy goods?—A. I would say to the commission that I might have placed this in a systematic way if I had had a little bit of preparation. The dairy industry of Vermont has increased very rapidly for a number of years—I might put it 20 or 30 years—and to-day all of the improved utensils and methods of dairying are adopted by the dairymen of Vermont.

Q. What are these improvements, in brief?—A. The dairy districts of Vermont have very largely adopted butter as the leading product, and have very largely adopted the Jersey cow. There are a good many herds of the thoroughbred in the State.

Q. What about the methods of setting milk, churning, and separating milk, churning cream, etc.?—A. The method of setting milk has been quite largely abandoned for the more modern and better method of the separator.

Q. Is this separation made on the farms generally, or in butter factories?—A. We have the creamery, as we call it. The butter factory is distributed very largely over the State covering the dairy section, and the bulk of the butter of the State is made in these creameries. The system first adopted was the gathering of the whole milk and returning it. That is apparently giving place now to a more economical new one, of separating the milk on the farm and carrying the cream only; but there is a great deal of private dairying done yet.

Q. (By Mr. FARQUHAR.) What do you do with your skimmed milk?—A. The skimmed milk is fed to swine and young calves.

Q. (By Mr. CLARKE.) What was the method employed by Vermont dairy farmers?—A. The old method was usually a shallow setting in small pans, and from that we had what was called the large pan setting, in which were pans as wide, nearly, as this table—3 feet wide and 10 or 12 feet long, according to the herd; and there was some system of cooling that was used in connection with that by the use of cold water. Then the next development was the deep setting in cans, and it was found that by suddenly cooling the milk the cream was forced to the top. Each of these was an advance upon the other method. This cooling process by the deep cans was an economy in space and gave more complete separation to the butter globules from the milk. The next stage was the separator, which has been in general use something like 6 or 8 years, actually working, and there have been little or no improvements over that.

Q. What are these separators?—A. These separators force the cream out by centrifugal motion. It is on the principle that in revolving the milk in a small space it is compressed and the heaviest portion of the milk will come to the outside and the lighter will go upon the inside.

Q. And the cream runs out of one tube— A. (Interrupting.) And the milk out of another. It is revolved very rapidly, something like 7,000 revolutions a minute, spinning like a top, so that it makes a noise.

Q. Are those used on farms as well as in the creameries?—A. They are used very largely upon the farms where any number of cows are kept.

Q. That is comparatively a recent practice, is it not?—A. That is comparatively recent; that is the latest thing.

Q. (By Mr. PHILLIPS.) What power do they use on the farms?—A. For these separations they have on the small farms hand power. For a small number of cows there is a very cheap animal power, in which a sheep or a large dog may be used, that will separate for quite sizeable dairies—separate from 800 to 500 pounds of milk in an hour's time. This leaves the milker an opportunity to go on with his milking while this separation is going on in a little room adjacent to the stable. For larger dairies they have larger animal powers; the horse, or quite frequently the bull of the herd is utilized for that purpose, with the additional advantage of giving him exercise; or the heifer, or something about the barn; and when we come to the creameries, to the associated manufacture of butter, steam or water power, or any of these modern engines, are used.

Q. When the cream has been separated from the milk is it allowed to set a while, or is it immediately churned?—A. There is a very small amount of it churned fresh, that makes what is termed fresh butter. It is butter without much flavor, and there is a limited sale for it. Cream passes through a process of what is termed ripening. It is cooled down immediately and placed under the ripening process. This ripening process is supposed to be the development of germs, and, in fact, they are using what is termed a "starter" to some extent, and the expert man knows at what stage—it is ripened under a certain temperature—and he knows at what stage to churn his cream to make the best quality of butter.

Q. What kind of churns are used?—A. They are using now entirely churns without any interior arrangement, paddles, or floats. They are using churns that produce butter—either a rotary barrel or box or swing churn. It strikes the cream from one end of the box to the other.

Q. What was the original churn?—A. The original churn was the up-and-down dash churn, and then from that the various devices of floats and paddles.

Q. Crank churns?—A. Crank churns.

Q. Is butter, when taken out of the churn, washed or not?—A. It is usually washed. That is the regular system, the system that is practiced in our dairy schools—washed with clear cold water until the buttermilk is washed out.

Q. Then is it worked or manipulated by hand or by some implement that is devised for that purpose?—A. There are various kinds of butter workers. They are used where there is any amount of butter made.

Q. What is the object in working it?—A. It is usually practiced, in the first place, by workers to eliminate the superabundance of water which comes from washing; and then the salt is applied, and the main object in working is to distribute the salt evenly through the mass. If it is not distributed evenly it leaves these little streaks of white. The salt heightens the color of butter a trifle.

Q. Is butter artificially colored?—A. During the winter time it is quite general, the artificial coloring of butter.

Q. What is the coloring matter most generally used in Vermont?—A. I suppose that the basis of the coloring matter is annatto. It is now put up in various forms mixed with oil that combines readily with butter.

Q. Is it perfectly harmless?—A. I understand it is perfectly harmless where it is properly made. Some of the articles put upon the market have been analyzed and condemned, but I suppose that the general butter coloring, in the quantities that it is used, at least, is perfectly harmless.

Q. How is butter put up for market?—A. The butter goes to market from the creameries and, in fact, from private dairies. It is prepared for the same market in several ways. There are the family prints, which come in small cases with a return box—the small boxes of 5 pounds which are supposed to be sold for family use; and it is put up sometimes in tubs and firkins.

Q. Do most of the creameries put on their own brands?—A. Always.

Q. Do many of the dairymen?—A. Always; always label their own goods with their own names.

Q. Has there been an increasing effort among the Vermont dairymen to find special customers in the cities and large towns?—A. Yes, there is; and at the same time the creameries make so choice an article that they usurp the market a good deal for choice goods. They make a very nice article of butter, and even the choice dairies now have difficulty in getting a price that is a great ways in advance of the general market. Formerly it used to be double. There used to be certain

dairies that would get a dollar, for instance, for their name and reputation, choice dairies; but that extremely high-priced fancy butter has been taken away, very largely taken away, by the choice qualities which the creameries now make; they supply a very even choice product.

Q. Does the average dairyman—I mean those who are not large farmers and specialists in the production of a fine quality—find that it is more profitable to sell his milk or cream to the creameries than it is to manufacture butter himself?—A. We have had this question under discussion at the dairymen's meeting this winter. There are no means of knowing how large a per cent patronize the creamery and how large a per cent are still in private dairying, or whether the creamery is on the increase or not; whether it is absorbing or whether there is a falling away. Some claim that there is a withdrawing from the creameries; that if a man understands the processes of making he can make a good uniform article and can do better to make up his own article and put it on the market himself. I think that is true, probably, but the question of labor comes in, and conveniences and skilled marketing. It is a very easy thing to take the cream and carry it right off and get rid of the labor about the household—the labor indoors and out.

Q. Are all the processes of dairying, and breeding for the dairy, and growing of crops for dairy animals discussed thoroughly, exhaustively, and scientifically in the Vermont Dairymen's Association?—A. I would say yes. I think everything that is known, every fact that comes out at the experiment stations in this country or any other country, is brought to this dairymen's association in a form to be reached and made popular.

Q. Has the influence of the instruction in these dairymen's meetings been to cause the farmers to observe great cleanliness in all the processes of production, even to the cleaning up of the pastures and the exclusion of everything that might contaminate the milk?—A. The tendency all along from the beginning of dairying has been in that direction, discovering what will injure milk and eradicating it both in the pastures and at the barn and through the house.

Q. In Vermont have you any weed that grows in the pasture that sometimes gives an odor or flavor to the milk?—A. I have heard of rare instances of that kind when the season was very dry and compelled the cows to eat things that they otherwise would not; and sometimes in the early spring, when they are first turned out, if they get at a locality where they can get the wild leak you get a flavor of that.

Q. (By Mr. CLARKE.) How many cows do you keep?—A. We usually run a dairy of about 20 cows.

Q. About what is the average Vermont dairy, or how do they range in number?—A. Of course they run down very small sometimes, but the average dairyman that makes a business of it has from 8 to 10, up to some larger dairies in the vicinity of 200 cows.

Q. How often are the cows milked?—A. Twice a day.

Q. Morning and evening?—A. Morning and evening.

Q. And is that milk strained?—A. Strained immediately and should be separated immediately, before it becomes cold. They find that the separator, to do its best work, should have milk at about the temperature that it comes from the cow.

Q. When is it carried to the creamery?—A. It is usually carried to the creamery every morning.

Q. And who usually carries it?—A. There are various systems of carrying it. The owner or farmer sometimes carries his own milk; sometimes a neighborhood combines along a certain road and sends a team down; and in some instances the creameries have sent out teams to collect for the creamery.

Q. Very commonly the farmer's wife or daughter drives down?—A. Or children, quite commonly.

Q. Are the hill farms and the meadow farms alike adapted to dairying?—A. Do you mean by meadow farms the farms of the Champlain?

Q. Yes, and in the various river bottoms?—A. Yes. We have on the hill farms what we call upland meadows, small farms. My impression is that the best dairy work is done among the hills.

Q. What are the grasses most common there?—A. Our common pasture grass is closely allied with Kentucky blue grass. I think the scientific name is *Poa pratensis*; I think that is our variety.

Q. (By Mr. PHILLIPS.) It is the native grass there?—A. It is the native grass there for pasture; but of late years this feed has had to be supplemented with the principal forage crops.

Q. (By Mr. CLARKE.) What are the principal forage crops in use in Vermont?—A. Clover, corn, oats, and peas.

Q. How is the corn fed?—A. The corn is fed as a supplemental crop. It is fed from the field green. The silo has been adopted very largely by the dairymen as a method of preserving the corn crop.

Q. Please describe the silo and the method of preparing the corn to be placed in it, and the use that is made of it and the season when it is used.—A. The silo is simply the process of canning on a large scale. An air tight inclosure is made, or nearly air tight, and the corn cut and put immediately in.

Q. Is that silo usually a large wooden vat set in the ground?—A. A large wooden vat, not set in the ground.

Q. Not set in the ground?—A. No; usually on top of the ground. The best method, I think, now in use, is building them round and hooping them with iron, with a diameter, perhaps, of 16 to 20 feet, making a large tank. They run that up to any height that they desire, usually 25 or 30 feet. The corn ordinarily is brought to the silo and cut in a machine, and the carrier takes it up and deposits it into this silo.

Q. Into what length is this corn cut?—A. About an inch. There are various opinions about that, however.

Q. Are there any improvements in that direction?—A. The practice is, and is advocated and confirmed by science and experiment stations, to let that corn mature; heavily ear the corn; the heavier, the better it is.

Q. The ears are cut, then, as well as the stocks?—A. The ears are cut. Occasionally the farmer takes a portion of his crop to feed other stock than cows; for his horses and his hogs and poultry. Some ears are picked off and a few hundred bushels thrown aside for that purpose and cribbed. But for cows it is always put in the silo with the ears on.

Q. That is packed down in the silo in its green state?—A. That is packed in its green state. Being very heavy it settles down very compactly, pressing the atmosphere all out, and then the top of it rots a little, a few inches, making a complete sealing, and it will keep any length of time.

Q. Does there have to be any artificial sealing or weighting?—A. Formerly it was weighted, but it is found unnecessary. They fill it, level it off, and go off and leave it.

Q. How is that taken out?—A. It is made adjacent to the stable with doors that can be taken out from the inside. It is usually thrown out with a fork into a car or carrier, in some convenient way, to run along—sufficient for the animals in the stable.

Q. Has there been any chemical action in that so that the nature of it has been changed?—A. It has turned sour. A portion of the starch has changed to vin egar, and is good ensilage, I believe; that is all. The loss is said to be less than in the process of drying.

Q. Are the cows fed exclusively from that?—A. No; they are not fed exclusively from that; that is used in connection with the hay.

Q. About what is the ration of a Jersey dairy cow?—A. A half bushel at a feed, I would presume, would be an average ration for a cow. Some feed it much heavier than that.

Q. Some hay or grass?—A. Well, clover feed and grain feed ordinarily, where there is a winter dairy.

Q. What grain?—A. The grain feed, as recommended by our experiment stations, is something that shall have a large portion of protein, and this is found in the cotton-seed meal, and the gluten meal and bran. Of course, it is found in oats. But when it is purchased protein can be found cheaper; these are by-products from manufactures.

Q. Is cheese as well as butter a considerable product of the Vermont dairies?—A. There are portions of the State that have their cheese factory, and it is quite an industry in the State.

Q. Where is the market for that?—A. There is one large manufacturer that sends all his cheese to one section of Ohio. The local markets of the State take a great deal of it, and I should state that some of it goes to Canada and is sold as Canadian cheese, getting a better price than American cheese would bring, because the American cheese has had the reputation of being filled; that is, skimmed of its cream and filled with certain oil to take its place.

Q. Boston and New York are also large markets for it, I suppose?—A. Boston and New York are the regular markets for everything that we have to sell in our section.

Q. Is every dairy farmer in Vermont also a mixed farmer?—A. Yes; he is, to a certain extent.

Q. That is to say, you keep other stock?—A. They keep other stock to some extent. The dairy and the poultry business apparently have been joined together, and more or less of them raise horses, and some of them keep a few sheep.

Q. Is sheep husbandry depressed in Vermont?—A. I think that the sheep industry at the present time is feeling a good deal encouraged; a good deal better feeling in the market for mutton. There is a better price for wool.

Q. Did the farmers slaughter their sheep during the free-wool tariff period?—A. There has been a great decrease in the number of sheep in Vermont.

In speaking of the conditions that seem to lighten up the monotony of farm life, along with better roads, I should mention the telephone. That is introduced in some sections of our State—local telephone. They are very cheaply put in, and the neighborhood owns them. I think of one neighborhood now that has a farm system of telephones in which there is 10 or 12 miles of local telephones, and it costs the owners only about \$20 apiece.

Q. To put it in and equip it?—A. To put it in and equip it and own the whole plant. The women of the neighborhood visit over them. They arrange their little sociables and church matters, and it does in a wonderful way what the village would do. In case of sickness a physician is called at a moment's notice, and I do not think of any one thing that has done so much for that particular neighborhood as the introduction of that local telephone to put them in touch with the whole community.

Q. (By Mr. PHILLIPS.) Do they keep a general superintendent to keep them in order?—A. No; it is wonderful how little repairs that telephone requires; that is, in my own neighborhood. Some young man in the community will take an interest in it, and he will soon become quite an expert in the little things that require attention. There are a few things that will get out of repair in a telephone, disconnection about the instrument, or a battery will get weak; and some young man will get to understand that very quick, and if he can not remedy it, he knows of a man right near by that he will go and get with his buggy; and there will be an assessment of a few cents on the people in the neighborhood for repairs. But that is usually covered by the delivery of dispatches from some other telephone and telegraph lines. They have a small rate for the delivery of messages from outside.

Q. (By Mr. KENNEDY.) Have you wire fences in Vermont?—A. We have.

Q. Do they utilize the wire fences in neighborhood telephones?—A. They never have in Vermont. I have heard that it is being done elsewhere.

Q. (By Mr. FARQUHAR.) You spoke of your Vermont cheese being taken to Canada and sold as Canadian cheese in the Canadian market. Is there any way of getting Illinois-made butter in Vermont?—A. Not in Vermont. The Elgin butter has a very high reputation, but I do not know of any sold in the State of Vermont.

Q. Who is the man that makes the filled cheese—the farmer or the middleman, or who?—A. The cheese business is something that I am not familiar with, and I am not certain that there is any made now; but that is something that has come into our dairymen's meetings as a reason for the low prices of American cheese.

Q. The question is, Who is responsible for the American filled cheese? What class of people are they; are they the commission merchants or the farmers?—A. It would have to be the cheese manufacturer, who is usually the man that buys the milk of the farmer. I would relieve the farmer of that.

Q. You mean, not the creameries, but the cheese factories are responsible for the filled cheese?—A. The cheese factories, yes; I should say so.

Q. And they are also responsible for the oleo mixtures of butter?—A. Not the cheese factories.

Q. Do you think any creameries use oleo?—A. No; I do not think they do.

Q. Are you sure?—A. Well, I could not swear to something that I did not know for certain. I could not, of course, tell what they do in all the creameries; but I never have heard of a case against the creameries.

Q. (By Mr. PHILLIPS.) Your law is very strict in your State in that regard?—A. In that regard. We should know it at once. I was thinking then of the Western creameries, where all the oleo comes from.

(Testimony closed.)

WASHINGTON, D. C., *Thursday, February 8, 1900.*

TESTIMONY OF HON. GEORGE HENRY WHITE,

Representative in Congress from the Second district of North Carolina.

The commission met at 2.55 p. m., Vice-Chairman Phillips presiding. At that time Hon. George Henry White, Representative in Congress from the Second district of the State of North Carolina, was introduced as a witness, and, being duly affirmed, testified as follows, the topical plan of inquiry on agriculture being followed:

Mr. PHILLIPS. The commission will now please be in order. Mr. Gardner is a member of the sub-Commission on Agriculture, and I will ask him to take the lead in asking questions.

Q. (By Representative GARDNER.) Please give your name, address, and present occupation.—A. My name is George Henry White; my present home address is Tarboro, Edgecombe County, N. C.; my occupation is that of an attorney at law; I am at present a member of Congress, from the Second district of North Carolina.

Q. You are the only colored man in Congress now?—A. Yes.

Q. And you appear before this commission to speak for your race?—A. Yes.

Q. Are you acquainted with agricultural interests generally in North Carolina, so that you desire to give testimony upon them, or is there some special feature, either as to agriculture or agricultural labor, to which you would prefer to confine yourself?—A. I had in mind a subject pertaining to agriculture; that is the landlord-and-tenant act in North Carolina and its application.

Q. Please state that in your own way.—A. Since the war we have had in North Carolina a homestead exemption of \$1,000 worth of real estate and \$500 worth of personal property, not liable to execution for debt on any judgment acquired, except judgment on mortgage given on that specific property; and since the adoption of the homestead law in the State nearly all debts that could be collected in the absence of the homestead are now reduced to criminal offenses. To illustrate, if a man has a store or a warehouse in which he keeps supplies for his tenants, and has tenants who rent his land either on shares or for a certain percentage of the product, those supplies constitute a lien on the crop of the tenant, and the removal of the crop without satisfying that lien is a criminal offense for which he may be convicted and imprisoned. A man rents land from the landlord; should he fail to pay his rent the landlord has a lien upon the crop, and if the tenant were to remove a peck of potatoes or a bushel of corn without satisfying the landlord's claim for rent, he would be indictable; and so on. I just mention those two or three instances.

Q. How is that lien created? By the landlord-and-tenant act?—A. It is a lien created under the landlord-and-tenant act.

Q. (By Mr. PHILLIPS.) That does not affect his own supplies for his own house, does it?—A. No; it does not affect the household goods. It only affects the crops.

Q. (By Representative GARDNER.) You misunderstood me—

Q. (By Mr. PHILLIPS, interrupting.) Could he keep his potatoes and corn in his house and not sell them?—A. No; he could not sell a peck of potatoes for his family, without permission of the landlord first had and obtained, without making himself liable to the criminal law. He could not use a peck of potatoes or meal.

Q. Are the tenants generally granted the privilege of using garden vegetables and potatoes?—A. That is ordinarily so to-day. But you rent some land to me now, and then in the fall we have a disagreement and I desire to make a change. Then you look around to find some way in which I can be held. I have gathered some stuff that I am not entitled to, and you will compromise with me, and I will stay until next year. It is very frequently used as a lever to hold the tenants when they are disposed to get out where they might be able to better their condition. But this is not the general rule. There are a great many landlords in North Carolina who will not invoke the exact letter of the law, and who give their tenants a great deal of fruit; and when permission is asked they will grant this permission to gather vegetables and something to eat in the closing out of the crop year before satisfying the lien which the rent constitutes on the crop.

Q. (By Mr. PHILLIPS.) Do you know any cases where persons cropping a farm have not had a right to those vegetables during the whole season? Where do they obtain those vegetables?—A. I was 8 years solicitor, commonwealth attorney, for the eastern district of North Carolina—prosecuting attorney, solicitor, as we say in North Carolina—and I speak from knowledge of actual experience as prosecuting attorney in the courts of 6 of the largest counties in North Carolina. There is, as a general thing, a little garden patch exempted where the landlord furnishes

the house as well as the ground. Sometimes I live on a little plat of ground of my own and rent land on your farm. I gather my vegetables and my own corn. That is not the case where a man lives in your house as well as on your land, but then as a rule there is a garden for the renter to take care of.

Q. That is exempt?—A. Which he gets without rent; that goes with the house, and then of course you are allowed to do just as you please with it.

Q. Is that exempted by law?—A. No; there is no law in reference to that at all. It is simply the will of the landlord.

Q. Then do you know of cases where persons were living on the ground in which they had to purchase their vegetables elsewhere, when they had been growing there?—A. No; I do not know cases of that kind. I know plenty of cases where there were no vegetables at all grown and they had to purchase them, but I can not state to you a case where they grew the vegetables. Where he furnishes the house, this house is on the land, and they live in the landlord's house as well as cultivate the ground. And with that a garden spot is usually given to grow such vegetables as you may need on the table. And when I spoke a while ago I did not speak as to that which is grown around the house, but as to that which is grown on the farm, such as potatoes, pease, and things of that kind cultivated on the farm. But even in the case that you stated, if I went on the place and went to carrying this garden stuff away without having an understanding with the landlord, either verbal or written, I could not remove it without making myself amenable to the law. But there is not one landlord in a thousand that would do that.

Q. (By Mr. FARQUHAR.) Now, to make it perfectly clear, is there under the law there any lien on this garden spot attached to the little tenant house?—A. There is no exemption; there is no reference made to the garden spot; that is purely a matter of agreement.

Q. Where it is silent has it ever, in cases that you have ever known, been invoked?—A. Yes; I have had cases in court where some fellow has indicted persons for gathering even out of the little garden spot. I have had cases in court when I was solicitor.

Q. What has been the decision in the court in cases of that kind?—A. Well, it was left to the jury, and if the evidence showed that he removed it from the ground, it showed an offense within the letter of the law. Our judges ride circuits, and we have judicial districts in North Carolina. We have 96 counties and 12 judges, and each judge has about 8 counties, and sits about 6 months, and it takes them about 2 years to get around. The solicitor does not travel with the judge outside of his own county; but I traveled with one judge who positively refused to notice any stealing of a watermelon or a little chicken, as too trivial a matter for a court of justice to take up. That was only one; that was Judge Whittaker. He directed me invariably in these trivial matters to enter a nolle prosequi; but in the State, I might add further in connection with the same feature, of criminal law being invoked to recover in respect to debt, since the adoption of the homestead law the distinction between grand larceny and petit larceny is abolished and all larceny is grand larceny. I have prosecuted a good many men who were sent to the penitentiary for stealing a chicken worth 25 cents.

Q. What length of time?—A. Up to recently that was purely in the discretion of the judge. He could send them from 1 year, which I believe is the minimum—maybe it is 6 months; when I was solicitor it was 1 year—to 10 years; purely a matter in the discretion of the judge. But by a recent act of the legislature that law has been modified so that if the article stolen does not exceed in value the sum of \$30, the sentence can not exceed 13 months unless it is the second offense. If it is the second offense, then it is left wholly in the discretion of the judge. In other words, if an offender has been convicted of stealing before, and that can be shown to the court, then this limit does not apply. But if that is not so, by a recent statute—I think possibly the statute of 1895, or very recently at any rate—if the value of the article stolen does not exceed \$30, the maximum penalty that can be pronounced by the judge is 13 months in the penitentiary. Of course, it disfranchises the offender.

Q. (By Representative GARDNER.) That limit of \$30 practically restores the ancient distinction between grand larceny and petit larceny?—A. Between petit larceny and grand larceny, except in a very few States petit larceny is not a felony. It is a felony in North Carolina, and the offender is disfranchised. The disgrace is the same as if he had stolen a horse or a hundred thousand dollars; it is only the length of time in the penitentiary. The distinction is abolished. I mention those two or three instances in connection with the landlord-and-tenant act, and that is true, if I might continue the list, indefinitely almost, by statute;

the people being poor, the masses of them. And I would add especially is that true of the colored people, of necessity, for they are very poor as a rule. There are some doing very well; there are exceptions; but they are few. We have some worth from five thousand to seventy-five or a hundred thousand dollars. The landowners, of course, have sought to invoke legislation to protect land in the collection of debts on the criminal side of the docket in lieu of the civil law, as I indicated a few moments ago. This application of the homestead act makes the records of our penal institutions rather black. They are very plethoric, possibly more so than they ever have been, and therefore misleading to those not familiar with the facts as to the criminal capacities of the people within the State.

Q. Suppose that with an exemption as large as \$1,500, there was no peculiar provision in the law protecting the landlord; what would be the result?—A. The result would be that each man would be forced to paddle his own canoe, or take the chances upon his honesty.

Q. True; but that only raises the same question. To state it differently, then, what would be the probability of his recovering his rent?—A. Well, he would be left—

Q. (Interrupting.) Would there be a probability that the result would be such that the landlord would find it not worth while to rent his farm, and that it would lead to the system of cultivation by the landlord on his own account, and stop the colored men from the possibility of becoming tenants?—A. I think that the homestead law is a decided drawback in North Carolina. In what I am saying, understand me, it is of North Carolina; I do not pretend to be familiar with the criminal laws of other States, that is, in detail; all that I am stating has reference to my own native State. But my own opinion is that while the homestead law was intended as a benefit to the poor man, to prevent the seizure of his small estate and the loss of his all, it works a real harm to him, because the landlords, the landowners, are almost forced for their own protection to invoke this criminal law to collect what otherwise they could collect under the civil procedure.

Q. Suppose that by the repeal of that provision of your landlord-and-tenant act, the landowner was driven to the northern method of farming on shares, would not the same effect result? Would not the appropriation by the tenant of the landlord's share constitute a criminal offense?—A. It does now under the law.

Q. Would it not at common law in any State?—A. Oh, I think not. It might come under the head of embezzlement as his agent under the common law, and in that respect become a common-law offense. But nearly everything that was prohibited under the common law in North Carolina has been reduced to statute. We practice very little under the common law.

Q. How far does the statute of North Carolina really change the matter from what it would be under the common law, if the landowner simply changed the system from a renting to a share system?—A. I think that he possibly would be amenable under the criminal law—common law, of course, covers that—for embezzlement of property. It could not be larceny, though larceny of growing crops is made a statutory offense in North Carolina now. Under the law, whenever anything is a part of, rooted to, attached to, and growing in the soil, it is a subject of larceny. Logs in the woods, trees in the forests, and bushes, and crops growing, potatoes in the ground, are subject of larceny now; statutory larceny.

Q. All States that I know anything about have covered it in some way; there may be technical differences. Some States, for instance, make it larceny; some malicious mischief; but the indictment is procured in the same way, and the prosecution is the same and the penalty is the same; the only difference is the name by which they call it.—A. I think that if these criminal statutes were removed, which are intended to be a substitute for collection under the civil law, then the tenant would have to resort to the croppers' lien and mortgage system. I suppose you can, in your State, mortgage a growing crop before it is even planted; we can mortgage it in North Carolina.

Q. And the removal of mortgaged personal property is and has become a criminal offense in most of the States?—A. So that the effect in the end would be about the same. My reason for making reference to this is that I believe that the homestead law in our section of the country is really a hindrance and trouble rather than a benefit to the poor man, whom it was intended to benefit. These technical violations of the criminal law, however, are not, as I should like to emphasize, invoked by the better element of our landlords. They are, as a rule, liberal; it is only by some shyster fellow who wants to stop me when I am disposed to go elsewhere with a view of bettering my condition. He finds that I have technically violated some of these laws. It is difficult for a man to live on premises for a time without violating any law—if not the spirit, some part of the letter. He uses that as a lever to hold them over, under a promise of immunity from prosecution in the courts. Frequently that is true.

Q. Is not the fact that the law can be used for a purpose like that, or any other purpose foreign to its pretended object, one of the severest indictments that could be brought against it?—A. Yes.

Q. (By Mr. FARQUHAR.) Are these liens acquired under contract?—A. No.

Q. I am speaking of acquiring the lien itself; that is, whether the contract is complete before you reach the lien?—A. That will depend upon the character of the tenant.

Q. Is it written or verbal?—A. Verbal. The law itself makes the furnishing of supplies and the rent of the landlord a lien upon the crop without any further procedure whatever.

Q. No limitation of time?—A. No; I can run a store account—and that is very frequently the case—run some account with a man and say I am going to farm on Mr. Smith's land. I want \$75 worth of supplies to run my crop. I make that bare statement. I go there and get whatever I may there that year; and my running that account constitutes a lien on my crop without any aye or no whatever—without any written agreement.

Q. (By Representative GARDNER.) Is that a provision of the landlord-and-tenant law or some other statute?—A. That comes under the general provisions of the landlord-and-tenant act.

Q. (By Mr. FARQUHAR.) At the end of the cropping year, suppose the tenant is not able to satisfy that lien; then what?—A. As a rule, he has to mortgage himself again and stand over.

Q. So that on account of bad crops, sickness, or anything else that might happen to him, there is an accumulation of debt?—A. An accumulation of debt; and in a great many instances (I do not want to impress you that this is the rule, but in a great many instances) it goes over the next year, and the man is never able to get out.

Q. And the man is mortgaged to the land himself?—A. Mortgaged to the land himself, and he goes on from bad to worse; they maybe have taken advantage of him, and he lives on and on in that condition.

Q. (By Mr. CLARKE.) Well, now, while this reduces to a condition of serfdom some unfortunate and thriftless tenant, is it not a convenience to the general average of farm tenants?—A. I can not say that it is a convenience. A great many thrive notwithstanding the facts or the law, a great many persons, but I can not say that is the rule. I should say not exceeding probably half are of that class. I know a great many who will rent for a while. They are thrifty; they have business capacity; they keep their own accounts. There is a great deal of fraud perpetrated on the ignorant; they keep no books, and in the fall the account is what the landlord and the store man choose to make it. They can not dispute it; they have kept no account. But, in response to your inquiry, there are many who thrive, and some of our people have purchased their own land, and sometimes I have known them to purchase of the landlord. In a great many instances their farms are cut up and parceled out to tenants, but I can not say exactly that it is the rule. That is not the rule; possibly an exception to the rule.

Q. (By Representative GARDNER.) What part of North Carolina are you speaking of?—A. I am speaking of the eastern part of the State.

Q. What are the prevailing crops there?—A. We grow in North Carolina cotton, corn, peanuts, and tobacco as staple crops. We grow very largely in the spring early truck to ship to the Northern people—pease, beans, and asparagus.

Q. To starve us out?—A. Yes. Especially is that true in the vicinity of Newbern, where I have lived ever since I have been a man up to the time I was elected to Congress.

Q. You strike for the Northern market and supplement that with table truck?—A. Yes. Cotton and tobacco are the principal crops. In the vicinity of Wilmington and the Cape Fear River we grow rice and peanuts and so on, which we supply and sell.

Q. (By Mr. FARQUHAR.) Do you sell immediately to the purchasers or do you sell through the store?—A. We sell to the store and warehouse.

Q. And you take whatever price the store offers?—A. Have to of necessity, except some man who has a crop of tobacco and has it in hogsheads so he can ship when he pleases and send it to Richmond and Danville. A man in that condition does not sell it for his immediate wants or necessities; he can hold his tobacco, as a great many do their cotton, and did last fall. Last fall cotton was 6 cents a pound and this fall it is up to 8, and a great many held it for the rise. But a great many can not do that, but have to sell as fast as they can get it out, to satisfy obligations incurred in the growing of it.

Q. What do you think the average would be there in respect to the small croppers and the large ones who are able to hold, in proportion to the amount of production?—A. I do not quite understand.

Q. That is, do the small croppers preponderate in the amount of production of tobacco, for instance?—A. Well, yes.

Q. They do?—A. Yes; in the Durham district and east of the center of North Carolina down to Wilmington and the Atlantic coast line, on each side of that possibly for 20 or 30 miles. We grow an abundance of tobacco in the Lenoir vicinity. Some of the finest tobacco in the world, I guess, grows in that region, and they grow this tobacco, tenants and all, and the landlord sells it for them or somebody sells it for them. A great many of these tenants are landlords. They take the crop on shares; they rent the ground and furnish their own teams and their own supplies, and give a third or a fourth of the crop for the rental of the land.

Q. (By Representative GARDNER.) Is not that the equivalent of the share system?—A. Yes; it is in the Northern sense. But what we understand by shares is for the landlord to furnish the house, team, seed, and implements, and the other party furnishes the labor, and they divide equally.

Q. (By Mr. CLARKE.) Divide equally?—A. That is what we usually do.

Q. (By Mr. FARQUHAR.) Have you generally found that this is about fair, that proposition that you make?—A. I can not say as to that; I have not been on a farm since I have been a man.

Q. But men have done well at that?—A. Often; yes.

Q. (By Mr. RATCHFORD.) What is the general social condition of the farm tenants?—A. I can not speak in very high terms of it as a rule. Poverty always begets degradation, immorality, and other vices, and possibly the masses of our farmers, I mean over half of them, are poor. A few grow to easy circumstances and do well; but I should say over half of them are poor people; very poor. We have them huddled in small houses, one, two, and not exceeding three rooms, sometimes eight or ten in the family, and their company and their eating and all is done in these little rooms; and the social standing can not be very elevated under those circumstances, as a rule.

Q. Are they mostly colored people?—A. Colored and white; in the eastern part the majority largely colored; in the west largely white.

Q. (By Representative GARDNER.) Mr. White, I am afraid I have totally misunderstood you. We have been talking about the renting of farms?—A. Yes.

Q. And the landlord-and-tenant act making the rent a lien on the crop?—A. Yes.

Q. I assumed while we were talking about that that the rent was a money rent, from a remark you have just made—A. (Interrupting.) Not necessarily a money rent; any rent.

Q. From a remark you have just made it would appear that it is rather a portion of the crop?—A. Yes; the money rent is not the rule. That is the exception to the rule.

Q. If the thing called rent consists of a portion of the crop—A. (Interrupting.) That is what I meant to say.

Q. The landlord is entitled to nothing by way of rent but that portion of the crop?—A. No.

Q. Well, then, the criminal statute of which you have spoken could not apply until the tenant had consumed something of the landlord's portion, could it?—A. Or any of it. I dare not move a peck of potatoes. Suppose I am occupying your land and you were to have one-half and I the other of the crop grown. I can not remove a bushel of potatoes on my part until your lien for rent is satisfied.

Q. (By Mr. FARQUHAR.) The lien that you have explained?—A. His rent as a whole.

Q. The law gives the share for the whole?—A. The whole machinery is on the side of the landlord.

Q. (By Mr. CLARKE.) Who makes the division of the crop?—A. Usually the landlord comes around after it is gathered and you have notified him that it is ready for a division—after it is hauled up by carloads, if it is corn, and they pile up yours here and mine there and I take one and you the other.

Q. The division is made by agreement as to time?—A. Yes; it is understood. Sometimes you gather yours and I gather mine. In that case I gather mine and you leave yours in every other row, and I take one row or two rows and you take what you choose. That is not the rule. The tenant gathers the crop generally.

Q. (By Representative GARDNER.) Both kinds of farming which you mention are called farming on shares in the North, the only difference being that the landlord gets one-third where the tenant furnishes everything, and he gets one-half where he furnishes the stock.

Mr. FARQUHAR. And seed.

Q. (By Representative GARDNER.) And stock. The farmer is very generally supposed to furnish the seed. When it comes to those things that require the out-

paying of cash, as in the dairy farms, for instance, where some grains must be bought in addition to those which the farm produces, there is some special agreement about that.—A. For a money rent we give so much cotton per acre. In lieu of giving cotton we give so much money for an acre of land. That is hardly ever the case.

Q. Would there be any difficulty about making a provision in making leases generally that as much ground as was necessary for the raising of vegetables and things required by the tenant should be exempted from the lien law?—A. He has not very much trouble in catching him whenever he wants to under the existing law. As I said in the outset, there is no provision for this garden spot under the existing law, except under the will of the landlord. There is no provision in it it at all for that, and wherever I am accorded a garden spot it is simply the will of the landlord, and the contract is a verbal one. I have only known of it two or three times in my experience at the bar of nearly 20 years, where some man of very small caliber wanted to press some man, and when he left him he invoked that provision of the law.

Q. (By Mr. PHILLIPS.) Even when he agreed to let him have it?—A. Yes; I know where a man was brought up for using some turnips growing out in front of his log cabin chimney. But I do not want to impress you and I do not want to impress the country that that is the average landlord.

Q. (By Representative GARDNER.) All I wanted to get at, as I have already stated, is as to whether that thing was intended to be fair or whether it was intended to be only a trap. I ask that.—A. I had rather not state my opinion as to that. The law is in favor of the landlord, and, if need be, he can use it to the detriment of the tenant. That is the general trend of the law through North Carolina, without the expression of it.

Q. (By Mr. FARQUHAR.) What is the difference in condition between those who own their own lands there and those who take the croplien system; the difference between the two classes of people?—A. It is a very broad difference. One is of an independent character, while the other is wholly dependent. One is naturally, as a rule, more responsible and more respectable, and of a different grade of people, as a rule, from that class of people who—I mean the masses of the class, I do not mean all—there are some very respectable, good men that crop all the while; they do not undertake to buy. They say, we take into consideration taxes, purchase price, interest, and all those things, and they had rather do that. They are very few and far between. The aggregate wealth of our country down there—especially is that true among the colored people—consists in small possessions, little farms, little homes, and little city property. There is no big wealth; that is the exception. I can not say there is big wealth anywhere, but there are a great many, a large number—you would be surprised to know the number who have purchased a little plot of ground somewhere, and are getting something to stand on; a large percentage of the people. And I think that is true—I am not so familiar with the western part of the State—I think that is true of our western people, who are very largely white. The bulk of the negroes in North Carolina are east of the center of the State; and up among the mountains, near Georgia and Tennessee, the western part of the State and the northwestern part, they are largely white. These mountaineers, as a rule, most of them are poor people; possibly they are not as poor as our eastern colored people.

Q. (By Representative GARDNER.) Some of your farmers, as stated, sell their crops through the storekeepers or warehouses because they have to; some buy lands and some do not. It is true, is it not, that those who sell their crops to take the greatest advantage of the market, and those who buy lands and own them, are more comfortable than those who do not?—A. Certainly.

Q. Is there any other cause for that than the difference in the individuals? Are not their chances about equal?—A. The chances between those who own their homes and those who do not?

Q. The chances primarily of each to get into a condition to hold his crop or buy land?—A. It is best for those who have some degree of intelligence and culture, and ability to calculate, or, in a word, to think for themselves; and the class who have not those things and are not in their nature capacitated to think for themselves—prior to the war the colored man, as you know, in the South was not expected to think. He was to use his muscle. Some of them unfortunately have never learned to think yet; they simply exercise their muscle, and others get the benefit. There are those who have learned to think for themselves; they plan for themselves and calculate, as any other business men do, and the result is that they soon acquire some property and get a foothold, and become somewhat independent. It is between the thinking class and the nonthinking class; between the educated and the noneducated.

Q. Then it is true in North Carolina, is it, that the educated, bright, peaceable colored men—A. (Interrupting) Industrious; put that in.

Q. Yes?—A. Because some of them are.

Q. Colored men or white men—I do not mean to make any distinction in color—succeed in agriculture?—A. Yes; they can succeed in agriculture.

Q. And probably become the owners of farms from their own accumulations?—A. Yes. I have in mind quite a number who are comparatively independent. The father of my private secretary died some short time ago and left an estate to two sons of possibly \$40,000. He was a farmer; started with nothing. He was a colored man, and he was worth easily \$40,000; and that in North Carolina is a right decent competency for either white or colored men.

Q. Did he make that farming?—A. He made that farming, and he made that entirely alone. His farm was four miles from Tarboro.

Q. (By Mr. CLARKE.) Since the civil war?—A. Since the civil war.

Q. (By Mr. RATCHFORD.) Did he make it by his own efforts or by the help of his sons?—A. He had two sons, but they were in school nearly up to the time of his death, and one of them graduated about the time he died; the one that is with me.

Q. (By Mr. FARQUHAR.) Did he hire the labor?—A. Yes; the sons never made anything to offset their education. In that sense they were a burden rather than a help. I do not mean to say that they did not work, but what I mean to say is that he expended more in clothing and refining and educating those boys than he ever accumulated by their work.

Q. (By Representative GARDNER.) He had no exceptional advantages?—A. No; he was a thoughtful man; he was a thinker.

Q. (By Mr. PHILLIPS.) Did he buy any large farms?—A. Those two boys have as good farming lands as any in the county, in several plantations.

Q. (By Mr. FARQUHAR.) What does good farming land sell for in these sections you are speaking about now?—A. That will depend very largely on the location and condition of the land. Land that has been made arable and brought up to a state of cultivation will sell for anywhere from \$5 to \$30. There is plenty of land there that you can buy for from 50 cents to \$3.

Q. Your finest arable land is worth from \$25 to \$30?—A. Twenty-five dollars generally is called a very good price for land, a very good price.

Q. You spoke of cash rentals; what is the annual cash rental for your best farms?—A. Per acre?

Q. Per acre.—A. I could not say. Here is a plat of ground; it may be anywhere from 30 to 40 acres. You say to me you could make 300, 500, or 1,500 pounds, bales of lint cotton, and you have for yourself a certain number of bales of lint cotton. I should say that the average of farm land will produce somewhere between \$3 and \$4 per acre per annum.

Q. (By Mr. RATCHFORD.) Three or four dollars per acre per annum?—A. Yes.

Q. (By Mr. FARQUHAR.) Six years rental would buy the land?—A. Oh, yes, the arable land; and woodland, that can be bought for what an acre would rent for.

Q. And your cropper lives all his life on it and he is never able to buy one acre?—A. I would not say that, but he does not buy very much land.

Q. I mean, under that system of landlord and tenant and under that law, a man that is under that system and then produces the rental out of the property (\$3 or \$3 an acre), does not acquire that?—A. He is very frequently a hard-working man; he has muscle, but he is not a thinker; he is not educated, and he goes on from year to year accumulating debt.

Q. (By Representative GARDNER.) I do not want any conflict with the major's idea, but what I was just going to ask you to emphasize, if it be true, is this: If a good business man, a farmer, white or colored, can accumulate a competence in agriculture in the eastern part of North Carolina?—A. Yes; in the eastern, middle, or western—anywhere in North Carolina that I am acquainted with. In the western part of the State it is mountainous, and the lands there are almost waste land, even in the foothills there, but on the steep slopes of the mountains there is splendid farming land. I should say anywhere in North Carolina. The State is rich in resources, and has an abundance of nearly everything. In the western part minerals are abundant.

Q. (By Mr. RATCHFORD.) You say, Mr. White, that \$10 is a good price for farm land?—A. Yes; the average farmer will bring that out per acre.

Q. Will that farm land that you speak of net a rental of \$3 or \$4 a year?—A. I should think so. Good farm land ought to bring a bale wherever land is worth that price, but not right straight through. You hardly ever buy cleared land without some wood. You fill it all in. You buy a plat or tract of land, you take it all; you buy so much right straight through. Now, that that is cleared or arable is

worth more, possibly, than the woodland, where there is no money expenses, and that, I will say, will be up to \$20 or \$30. But you take a plat of ground, \$10 would be a very high price for the average plantation down there. Now, on that plat of ground, the arable land, you can grow on fairly good land a bale of cotton to the acre, and a bale of cotton is usually from 450 to 500 pounds of lint cotton. That cotton now is selling at 8 cents a pound. You can make your own calculation.

Q. Is not that an exceptionally high rate of interest for the landowner?—A. Yes.

Q. Rental?—A. Yes, pretty high, but it is only the best land that you can get that out of.

Q. (By Representative GARDNER.) What outlay for fertilizers is required to produce that crop on average cotton land in North Carolina?—A. I do not know that I can answer that intelligently. I know that we use a great deal of fertilizers on the farms near the cities and towns, but remote in the country we produce our fertilizers from the stock, composts, and a few barrels of lime. We have the cuttings and droppings of the stock mixed in with, maybe, the leaves and refuse on the edge of the swamp. They mix that in to kill the sourness and to cause decomposition, and the mixture makes a very excellent fertilizer.

Q. (By Mr. PHILLIPS.) Composts?—A. Yes; composts. Now, as to how much fertilizer—guano, or whatever it is composed of, or anything of that kind—I can not answer that. I do not know how much per acre. I could not say. I have seen it going on, but I have never made myself familiar with it.

Q. Is not land worth more than \$10 per acre? Before the war, in the eastern part of North Carolina, was it not much more valuable than it is now?—A. I can't say. Before the war I was a baby. I was born, but I was very young.

Q. I did not know but you knew the history. In many parts of the South the land was very valuable.—A. You take a great many of these large plantations with the old English method of farming, a great manor. Here is a wealthy man, having anywhere from ten to one thousand slaves, and a great many men did not know their slaves when they met them on the road. They had a large plat of ground. You could not tell anything about the value, because the owner did not need any money and he would not sell it for any price. Since his death the family have moved to cities and towns or to some other country; the land has been cut up and sold off. It would be difficult to make a comparison between the prices to-day and the prices before the war, because the lands were not for sale unless a man made up his mind to move from one State to another, and sold the whole thing. But it is my supposition that lands would bring proportionately a greater price in money then as compared with now; somewhat more than they do now.

Q. Is there much employment of labor by the day or by the week or month; and if so, what wages is it usual to pay on the farm?—A. Yes; there are a great many persons who do not undertake to farm at all, but just hire themselves out either by the day or by the month. It is very unusual to hire by the week. They hire themselves out on a farm for the day or for the month. Some of them wait until the fall and the crop is sold, outside of the actual consumption for food, and others are paid daily as they go along; very largely paid off in provisions for their families and paid from the storehouse. And I may say that these storehouse profits—the tenant or the purchaser pays for everything, and they are very high prices—double what he would have to pay in the city. The day laborer usually has from 25 to 50 or 60 cents a day. By the month it is from \$6 to \$10 a month.

Q. (By Mr. CLARKE.) And board?—A. Sir?

Q. And board?—A. No.

Q. Without board?—A. Yes; without board.

Q. (By Mr. PHILLIPS.) Do you mean to say that a man could live on \$6 a month and keep a family and pay his board?—A. A great many men are keeping families with a wife and four, five, six, or eight children, and they do not get over \$10. But remember that the man is hired out, the wife is hired out, and every child is hired out, and the wife takes the babies along with her. A great many families live on less than \$10 a month. The provision is very coarse, but it is common food. It is usually corn, a little molasses, and Western side meat. They live on the coarsest food, wear the coarsest-textured clothing. They can not do otherwise.

Q. (By Mr. RATCHFORD.) Are you speaking of a class of men who work by the day or by the month and are employed by the tenants on the farms?—A. By the landlord, or it may be by a very well-to-do tenant. He runs a good deal of land—runs a four or five horse crop, and he hires these men.

Q. Will the same wages apply to those who are employed by the land owner on the month or day plan?—A. Yes; no difference. If I am a landlord or a tenant, the wages paid to these hirelings are about the same. One pays about the same as the other.

Q. (By Mr. PHILLIPS.) Is there any prejudice against colored people accumulating land in that country?—A. I think there is very, very little against the colored man for accumulating property, except in the way that I have indicated; obstacles thrown in his way by these loopholes in the law and by his ignorance and incapacity in some instances. Some of them have an incapacity to make their own calculations and to think and plan for themselves. I can not say that I know of any prejudice against the colored man's accumulating property. There is that fact and the fact that there is very little prejudice against his getting an education. True, you have not asked me about any educational matters.

Q. (By Mr. FARQUHAR.) You seem to me to indicate that the intelligent farmer would be a more independent man to do his own thinking, have a little tact about his own business. What is the condition in this rising generation? Are the facilities for education good down there?—A. No; they are poor; and I want to say that without meaning to cast any disparagement on our State legislature.

Q. Is there an insufficiency of schools?—A. There is an insufficiency of funds to run the schools. The average school term in the State is about 62 days in each year. The average schooling given the child is 62 days.

Q. (By Representative GARDNER.) Is the time fairly distributed over the State?—A. In a good many cities down there we have graded schools. They have a special tax on all the taxable property and polls to raise an extra fund; and these run from 6 to 9 months in the year, these graded schools, whereas in a great many rural districts they run maybe only 30 or 40 days in the year.

Q. (By Mr. PHILLIPS.) Are the schools separate—colored and white?—A. Oh, yes.

Q. Do they have about the same time?—A. As to that, it is a matter of exact knowledge, and I can not say. There is more money paid to the white school for a given number of pupils than for the like number of colored people, notwithstanding the constitution. The teachers are paid more, in the first place. Though their education may be the same, they may be examined by the same board and get the same certificate, the whites are paid more wages; and as a general thing, I guess, the whites' terms run a little longer than the colored.

Q. (By Mr. CLARKE.) Are all the teachers of the colored schools colored?—A. Yes, mostly. I do not know of a white school-teacher teaching a colored public school in the State.

Q. Are they men or women?—A. Both.

Q. Are there any societies for the improvement of the farm tenants or farmers generally, such as agricultural societies, granges and the like?—A. We have granges and agricultural societies and farmers' alliances. The colored man is not admitted to them; they are for white people only—unless he forms one separate and distinct to himself.

Q. (By Representative GARDNER.) Has he joined that?—A. Yes; we have had a good many colored alliances, until recently it came into disrepute. I do not know of one now.

Q. Why did it come into disrepute?—A. They got into politics. The Farmers' Alliance of North Carolina drifted into the Populists, and the Populists made an alliance with the Republicans, and that brought the organization, both white and colored, into disrepute.

Q. What I want to get from you is something that, coming from such a source, ought to be valuable. Has the colored man in North Carolina, in alliances or other organizations for the benefit of those engaged in any business or trade, showed a capacity for organizing and maintaining the organization in good standing?—A. I do not know that we have had an organization among colored men, either the Knights of Labor or the Farmers' Alliance, separate and distinct in itself, that was sufficient to make such a test as would warrant me in giving you a positive or negative answer. When I spoke of the colored alliances, I did not speak of the Knights of Labor, but will now. We had both organizations there, but they were branch organizations of the white. They had separate lodges, and did not meet together, but it was understood that they were branches, a part of the general labor organization. But the agricultural societies and Farmers' Alliance, as it is known to-day, is a white man's institution entirely, and the colored man can not join these white organizations. He is not permitted in them. He is shut out.

Q. (By Mr. PHILLIPS.) Do you keep up the Knights of Labor organization in the South?—A. I do not think so. I am ineligible to membership under the law. Lawyers are not allowed to join.

Q. (By Mr. KENNEDY.) Lawyers and saloon-keepers are ineligible.—A. Yes; and a good many other good men.

Q. (By Mr. CLARKE.) Practically there is little or no organization or meeting for the discussion of agricultural methods among the tenant farmers of North Carolina, especially if colored?—A. That is right. Now the mere fact that these organizations drifted into politics brought them into disrepute and precluded their meetings, because their meetings are secret, and there is a statute prohibiting any political organizations of a secret character, so that they do not keep it up. They would have been indicted if they had kept it up after they carried it into politics.

Q. Is there an agricultural college in North Carolina?—A. Yes; two. There is an agricultural and mechanical college at Raleigh for the whites, and there is one, on a much smaller scale, to be sure, for the colored at Greensboro.

Q. What kind of an idea would it be for these colleges to adopt the university-extension plan, and send lecturers among the tenant farmers and instruct them in improved agriculture?—A. There have been lecturers and institutes—that is, farmers' institutes—held in various parts of the State every year under the auspices of the Department of Agriculture, but that is for the whites.

Q. (By Mr. FARQUHAR.) The colored man is not precluded?—A. He is not expected to be there. I do not know that he would be driven away if he was to go, but it is understood that he is not expected to be there.

Q. Are they not of the character of mass meetings?—A. No. There are certain places where the colored man does not go when he understands that he is not expected to go there. He would be very easily got rid of.

Q. Have you any private schools in your section supported by yourselves that are independent of the common schools?—A. Yes; there are a great many private schools in the cities and towns. I have never sent one of my children to a public school in North Carolina in my life.

Q. Have you any in the rural districts?—A. Not in the country. You will find cases where a teacher may teach a school for two months, and the people will feel that they have not done justice to their children, and they may have a little money, and they will run it on as a subscription school for a month or two. In the cities there are parochial or other private schools under the auspices of some church that run constantly. The Episcopal, Methodist, Presbyterian, and Baptist churches have these, independent of the public schools.

Q. (By Mr. PHILLIPS.) For colored people?—A. Yes; whites, too, but the two are separate.

Q. Do the whites contribute to the colored schools?—A. Not to the private schools.

Q. (By Mr. FARQUHAR.) You have no lack of teachers, have you?—A. We have plenty of them—more than we can get places for. The reason for that is, we have in North Carolina a bill creating 4 additional normal schools, which we tacked on to the universal appropriation bill. We have now 6, 7, maybe 8 colored normal schools, and many institutions of different kinds among the whites as an offset for it; these are for the special purpose of training teachers. There is one of them in my own district at Goldsboro. We have a great many of the denominational institutions of higher grade. We have the Livingston College, the Bennett Seminary at Greensboro, and the Agricultural and Mechanical College at Greensboro. We have the Scotia Seminary at Concord, a Presbyterian school maintained and equipped by Northern people largely, President Satterfield. The president and a majority of the teachers are white. My daughter was educated there and is a teacher of music there now. We have another school, where my nephew graduated in June. That is officered entirely, outside of the board of trustees—I am on that board, too—by colored men, except one gentleman who teaches German; he is a white man. Then coming a little further down we have the Livingston College at Salisbury, and then at Raleigh we have the Shaw University, under the auspices of the Baptist Church. That is a college—has medical, law, and theological departments, and is on a very large scale. They have several hundred pupils. In the same town we have the St. Augustine Normal and Industrial Institute, under the auspices of the Episcopal Church. It is contributed to indiscriminately—not necessarily North or South. These schools are independent of the public schools. Then we have the Gregory Normal Institute in Wilmington, under the Congregational Church. These are all independent of the public schools and the regular normal schools. So the facilities for higher education of the colored people of North Carolina are very good, and that accounts for the surplus of teachers—the graduates of colleges.

Q. (By Representative GARDNER.) Your system is top-heavy, then?—A. Rather so. If you eliminate these private schools and eliminate the schools in the cities—

the graded schools in the cities are run from 6 to 9 months in the year, but the rural or country schools, that are so poorly attended and provided for, make an average of only about 62 days in the year.

Q. (By Mr. FARQUHAR.) In these colored schools and colleges are the students cared for under an endowment, or do they usually furnish their own means?—A. They have to use their own means. There is a small endowment to each, perhaps, but scarcely enough to pay all the professors. These students, as a rule, pay their own way. Now and then you get a scholarship through a philanthropic person in the North. Some lady or gentleman says, "I will furnish you \$40 or \$50," and the faculty or president has a right to designate such and such a pupil who will be supported out of that gift, and that is kept up until the pupil graduates possibly.

Q. None of them have a permanent endowment?—A. Not enough to pay the professors. They have to keep a financial person on the road begging all the time to keep them going. They require additional equipment; they are building or enlarging their laboratory and other things, so their funds for endowment of professors' chairs or aid of indigent pupils are not sufficient.

Q. Have you any method in your mind to suggest for the improvement of the colored race, the farming people?—A. I have not now, sir. We are in a bad way in North Carolina, the colored people are now.

Q. Have you any information that will cure any of these difficulties which you mention?—A. Yes.

Q. Do you think that the general condition of the colored people in your State is gradually improving or going back?—A. Up to a year or two ago our condition was decidedly on the upper trend. The best feeling that I have known anywhere in the Southland existed between the whites and colored in our State. Politics, though, has made things a little bad for us. It is difficult for an illiterate white or colored man to differ in politics without differing in church, business, and everything else. The colored man has adhered quite rigidly, whether wisely or not I will not say, to one political party, and that party has been recently overthrown, and in my opinion the most vicious element of the white race is now in possession of the State. A large majority of the whites are kindly disposed to the colored man, and it is evidenced by the fact that they have all these years paid without murmur the bulk of the school tax. They have shown in hundreds of instances the evidence of their good feeling toward the colored man, but unfortunately politicians have not only dragged the race into politics, but even on the farms and in domestic affairs. In the city of Wilmington, in the latter part of 1898 and the first of last year, domestic servants were discharged and driven hither and thither and did not know what was going to happen. That has subsided and the bad feeling has died down somewhat, but we have a bad state of affairs and the way looks dark for the future.

Q. (By Mr. PHILLIPS.) What led up to that state of affairs?—A. I had hoped not to refer to politics at all.

Mr. FARQUHAR. If it is politics, you must not.

The WITNESS. It is politics.

Q. (By Mr. RATCHFORD.) Before we pass the subject of education I want to ask another question. Are the public schools that you have so fully explained supported by the well-to-do and the most intelligent of the white and colored race in the South?—A. Yes; but you understand these schools are separate and distinct. Now and then you find a white man in the South who will say to a colored boy who has attracted his attention, "Here is \$10 or \$15 a year to help educate you." But the private schools of the lower grade—I was speaking of the colleges and seminaries—the private schools of lower grade are separated into colored schools for colored children and white schools for white children.

Q. And the interests which support them, are they composed of the best element of both races?—A. Yes. One of the reasons for the schools is that there are a great many white and colored people who do not care to have their children go into the public school and be mixed up with the kind of pupils that are there.

Q. The tax for the support of the schools, is it largely from the rich or the poorer class, the farm labor that you spoke of a while ago?—A. These schools do not apply to a very great extent in the rural districts; only a very short supplemental term.

Q. Does the fact that you have a system of private schools there, that is so generally maintained—does not that militate against the support of the public schools?—A. No.

Q. It does not?—A. No. The public school can not be interfered with. It is fixed by constitution in the first place, and then where it is not completed in the constitution, the minimum and maximum amount to be collected, it is generally by

statute. So that the private schools do not have anything to do with the tax collected for the public schools.

Q. It requires influence to have statutes enacted, and according to your testimony the better element are schooling their children in the private institutions, and their interest in the public schools would naturally not be so great.—A. Perhaps you may have got an impression that it is universal, but it is not. It is in cities and towns and in isolated cases in the rural districts, but that is an exception. I do not think that the private schools hurt the public schools at all. We had a statute making it discretionary with any precinct, on the application of a certain number of men to submit the question—I do not remember the percentage of men required to make the application for any precinct to levy the tax, but it was discretionary with the school district whether or not they would tax themselves for the extra tax to run the school a longer term, and very few took advantage of it.

Q. Do you or do you not think it possible that those who are obliged to send their children to the public schools where the terms are so short can possibly acquire any education whatever that will benefit them?—A. Yes; they acquire some education. It is a rare thing to find a young man or a young woman of 20 years of age who can not read and write and cipher rather intelligently.

Q. Even with that short school term?—A. Even with that short school term, yes. You understand me, when I speak of the whites and colored running these private schools, that is altogether in the cities, and the private school in the rural district is only supplemental to the public school. I do not remember a single instance where we have a private school separate and apart from the public school. It is a supplement to the public school, conducted in the same building and by the same teacher after the funds are exhausted.

Q. (By Mr. PARQUHAR.) What kind of sumptuary legislation or laws have you in North Carolina, temperance and other laws, local option or what?—A. We have the dispensary system, fashioned somewhat after South Carolina in certain counties. We have it in Cumberland County, where the town of Fayetteville is located, and some of it in western North Carolina. We have some counties where whisky is not allowed to be sold at all. It is prohibited entirely, and the discretion is left with the county commissioner; that is until recently. I am not familiar with the law passed last year. Prohibition is not a very pronounced quantity in North Carolina.

Q. Have you any positively dry counties?—A. Yes; some few counties where there is no whisky permitted to be sold at all. In these dispensary counties it is sold under the protection of the dispensary authorities. That is only in localities; not general.

Q. What is your observation with respect to these option counties that go entirely "no license?" Are they an advantage to society, both white and colored?—A. I think they tend to help society somewhat. If the law was rigidly enforced, I could answer that decidedly in the affirmative, but there is a laxness. Public sentiment, you know, is law, and there is a laxness on the part of the public authorities in enforcing it, and these blind tigers or illicit stills are in every corner of the community, and the drug stores take advantage of the law, and sell it under different names.

Q. Does that arise a good deal from the fact of the moonshine distilling?—A. I do not think that has much to do with it. The license saloons are run very largely by the moonshine distilleries.

Q. What is your own general view on the question of intemperance among your colored people?—A. I think it is the curse of our race—one of the greatest curses of the colored man. You can hardly blame him, or expect him with an emancipation of 35 years to get out of what has been taught him for two centuries. He is very much of a copyist, a plagiarist, very adjustable, as you doubtless have observed. You take a colored man as a servant in your house, and he may be crude and coarse, illiterate; keep him there one or two years and he will speak almost as accurately as your own children, and dress much as you dress and act as you act. In other words, he is a great imitator, and, unfortunately for him, he has imitated his white brother in these vices as well as his good qualities. Hence his propensity for drinking whisky, which is one of the curses of his race. It is his misfortune. I am not trying to shift the responsibility, but it is his misfortune.

Q. It is not entirely from inherited habit?—A. Not inherited, but from a cultivated appetite. He never had it until his emancipation. But he thought he had done without it so long that he has been making up for lost time.

Q. Does not intemperance account for a good deal of the shiftlessness of your tenant farmers?—A. It is particularly in the cities and towns. It is true some

farmers go to town once a month when they have been paid their wages, and have a raze while the money is flush, but it is not common. The intemperance is largely in the cities and towns.

Q. Is it very much the custom of your people to leave the country and go into the cities and earn a very uncertain livelihood?—A. Very much so; decidedly.

Q. Is it the lack of frugality or industry that takes them to the city?—A. It is the oppressiveness of the landlord-and-tenant act, as practiced by the landlord, reducing them to serfdom. There is absolutely nothing before them on the farm, and they lose hope and go to the cities. That is one of the reasons—possibly the leading reason.

Q. They try to escape the conditions that keep them continually in debt?—A. Working year in and year out, with little food or clothing, with no prospect before them but to continue until they die.

Q. Is there much migration among your agricultural help in the South?—A. Not so much as a few years ago. There is now a general unrest in the State because of pending matters.

Q. Is there to any extent an emigration to other States, like Texas and Mississippi and elsewhere, during these troubles?—A. Where the people have been left to themselves to emigrate it has been largely to the North and East, and somewhat to the West; but where the agents with oily tongues come about and offer flattering inducements they have gone from one Southern State to another. That is true of the Mississippi valleys, along the banks of the Mississippi River.

Q. What are your views on colonization generally, either within the United States or expatriation?—A. I am decidedly opposed to either; I think it is bad for us. We, as a race, so far as we are civilized, have the white man's civilization—have copied it from him—and if there must be migration I do not think it is wise for either the white or black that the migration be in bulk either within the United States or without. But I do believe that the stress of the great mass of colored people ought to be relieved by a gradual thinning out. Take them here, there, and anywhere; lose them as it were throughout the whole country, that they may have a new impetus by the changed habits, educational facilities, changed opportunities, and in that way I believe if the colored man—if homes could be found for him among the people East, West, and North, away from the South—not enough to depopulate the South, but to relieve the overcrowded agricultural communities, where the supply is far in advance of the demand for labor—if these communities could be relieved by taking and distributing them here and there in one State and another, I believe it would be the best way to solve what is now regarded as the race problem.

Q. Do you suppose, under the system proposed by Booker Washington and others—to take sections as large as counties, where the colored people could be aggregated, and where they would have no particular leaning on the white element as in the South, and have a very fair idea of agriculture and the mechanic arts—do you suppose they could equally with the poor whites of the South support themselves and be equally independent?—A. Perfect equality of the two races, either in education, industry, or politics, is next to the impossible. Even though the colored man should be admitted to equality, the white man's superior civilization from long years in advance of him, and his supremacy, wealth, and superior education, would tend to keep the colored man his inferior.

Q. So you still think, after all, that whatever plans or modifications may be made for the betterment of the condition of the black man, he has got to lean on the white?—A. Very largely. They are dependent on each other. I do not know whether you live North or South, but if you go, say, to Wilmington, where all that murder and carnage was, or any other Southern city, and undertake to induce the colored men to pack up and leave any particular community, it will not be healthy for you there 24 hours, and not from the colored man, either.

Q. (By Mr. KENNEDY.) Is not the proposition to colonize the colored man outside of the United States so impracticable and impossible as to be unworthy of serious consideration?—A. I do not see how any thoughtful man can attach any importance to it whatever. Yet there are men, for instance Bishop Turner, whom I know to be a very able man; but it is a hobby of his, and I think he has an underlying purpose to accomplish—another end in view. He knows his white neighbors do not care to have the negroes leave, and I see no other reason that he could have but to arouse them to mete out justice and equality to them in order to keep them there. I can see no other reason.

Q. Your theory would carry with it just the reverse of colonization? It carries with it a greater assimilation among the whites in all parts of the country?—A. Yes. Whatever civilization we have we have got from you. You have been our inspiration. Our aspirations have been from you; and wherever that has been

carried to the highest extent, and where there is a higher ideal and the colored man can grow up to it, he will advance and become a more useful citizen. But where everything is on the level, where his white neighbor is poor and illiterate, where there is no hope or sunshine, where he sees the horizon and it terminates before him, there is nothing to aspire to and he goes from bad to worse.

Q. That absence of hope and sunshine also reaches into the other race, does it not?—A. Yes; but I am speaking more particularly of the classes of people I know more about.

Q. The point I wish to bring out is this: That where the colored man of the South is in the majority, in districts or sections largely populated by the colored man, the absence of sunshine, the presence of degradation and poverty, reaches into the homes of his white neighbor and keeps him down on the same level with himself, does it not?—A. To a certain extent, yes; but eliminating South Carolina and Mississippi, there are very few communities in the South where the negro is in the majority. We have 96 counties in North Carolina, and only 8 or 9 in the whole State have a negro majority, and then only a small majority of 100 or 200.

Q. (By Mr. PHILLIPS.) How is it in your district?—A. In my district there are 5 counties out of the 9 that have a negro majority. Two have a margin of 200 or 300. The other 4 have an overwhelming white majority.

Q. Then you got a great number of white votes?—A. A great many. I am sent to Congress not on black votes alone.

Q. (By Mr. RATCHFORD.) We have testimony to the effect that as a result of the keeping down of the colored man he works for low wages, and the white man who is obliged to work for a living can not hope to get much more than the colored man obtains for his labor.—A. Under certain conditions that is true.

Q. They do not need to have a majority to bring about such a state of affairs?—A. We have in the South cotton and woolen factories here and there. With an isolated exception now and then the colored man is not allowed to work in them at all. The colored man does not compete in these instances with the white labor. Until recently they have had almost a monopoly of the skilled labor—mechanics, carpenters, blacksmiths.

Q. They compete on the farm?—A. They compete on the farm.

Q. And could not possibly compete more directly anywhere else?—A. They compete there, possibly, more largely than in any other place. It is rare to find a white farm hand. They either rent for themselves or have their own little plot of ground in eastern North Carolina. I do not know so much how it is in the western part, but there are very few colored families there; they have little negro competition.

Q. Then, if the plan advanced by you is a good plan, it would also advance his white brother?—A. It would relieve the strain—leave a better outlet for the white man and for the colored man, and better, in my opinion, for the one who is carried and lost in the civilization of you white people in some other section.

Q. (By Mr. PHILLIPS.) You spoke some time ago about having families move to various parts of the country—North, East, South, and West.—A. Not South.
